THE HISTORY OF THE HEBREW COMMONWEALTH, from the Earliest Times to the Destruction of Jerusalem, A.D. 70. Translated from the German of John Jahn, D.D. With a continuation to the Time of Adrian. By CALVIN E. STOWES.

'This very able work of Professor Jahn, one of the most learned of Continental biblical scholars, has long been a desideratum in the English language. In presenting, therefore, the excellent work of Dr. Jahn to the English reader, Mr. Stowes has performed a very acceptable service, and deserves great praise both for undertaking so laborious a task, and for the creditable manner in which he has executed it. No biblical student should be without it, and it may be read with interest and profit by the general inquirer.'—Monthly Review, June, 1829.

London: Hurst, Chance, and Co., 65, St. Paul's Church-yard

BARNETT'S SONGS of the MINSTRELS, Vol. II. Price 15s.

'These compositions are entitled "Songs of the Minstrels," and do equal honour to the Poet and Musician. The Portuguese Minstrel, "The Spot where I was Born," is particularly beautiful; and the Russian "Maid of Tartary," highly striking and original. These two, with the Neapolitan and Turkish, four of the twelve, are fully equal to the best of the first volume; indeed, there is not one which does not boast of some of the merits peculiar to this extremely pleasing and delightful publication. Mr. Barnett is the cleverest and most tasteful of English composers. The Poetry is by the late Harry Stoe Van Dyk.'—Vide Literary Gazette.

Published by Mayhew and Co., 17, Old Bond-street,

Where may be had the following New Songs:—

- 'Rise, gentle Moon,' sung by Miss Love, with the most enthusiastic applause, and nightly encored, in the historical drama of Charles XII., composed by John Barnett, with a beautiful Lithographic Portrait of Miss Love, 2 6
- 'My sweet Guitar,' sung by Miss Love with distinguished applause; composed by John Barnett, 2 6
- 'Here's a Health to Merry England,' National Song; sung by Mr. Braham, composed by John Barnett, 2 0
- 'Listen to my Wild Guitar,' written as a companion to the celebrated Serenade, 'The Light Guitar,' composed by John Barnett, 2 0
- 'The Chimes of Zurich,' sung by Miss Love, written by Harry Stoe Van Dyk, composed by C. E. Horn, 2 0
- 'Sweet Evening Star,' answer to Barnett's celebrated song, 'Rise, gentle Moon,' composed by Joseph Hart, 2 0

TO NOBLEMEN AND FAMILIES.—DRAWING ROOM CARPETS.

WHITE and METCALF have the honour to announce that their new, and truly splendid patterns in Brussels Carpets, designed and manufactured exclusively by this Establishment, are now ready for inspection, in quantities infinitely superior to any before offered, and suitable for either the Mansion or Cottage. Highest Price 4s. 3d. per yard. Navarino House, Lamb's Conduit-street.

TERRO-METALLIC TEETH.

MR. A. JONES, Surgeon-Dentist, 43, New Bond-street, begs to acquaint the Nobility and Gentry, that from many years' intense application, he has invented and brought to perfection, a New System of Fixing TERRO-METALLIC, NATURAL, and ARTIFICIAL TEETH, from one to a complete set, which are so accurately fitted as not to be distinguished from the original, and answer all the purposes of mastication, articulation, &c.—Mr. A. J. continues stopping decayed teeth with his unrivalled Anodyne Cement, which in one minute allays the most excruciating pain; and by this means carious teeth are wholly preserved and rendered useful, even if broken close to the gums. This being a metallic composition, it becomes hard as enamel in a few minutes; will not decompose with the heat of the stomach, and resists the effects of acids, atmospheric air, &c.—Cleaning, and every operation incidental to Dental Surgery.—At home from ten till five.

DR. KITCHINER'S ZEST.—This incomparable Flavour for Soups, Gravies, Made Dishes, Game, Poultry, Fish, &c., the sole invention of the late Dr. Kitchiner, and repeatedly mentioned by him in 'The Cook's Oracle,' is now prepared from the Doctor's original recipe, and is sold by JAMES BUTLER, Herbalist and Seedman, Covent-Garden Market, whose name is written on the direction for its use, without which none are Genuine. The Zest is particularly adapted for families travelling, imparting its delicious taste on immediate application. It will keep for any time, in any climate.—Sold also by Messrs. Knight and Sons, Italian Warehouse, 83, Gracechurch-street; and by Mr. Hickson, Italian Warehouse, 72, Weibek-street, Cavendish-square; and Mr. Lazenby, 46, Lamb's Conduit-street; in bottles 2s. 6d. each.

London: Printed and Published every Wednesday Morning, by WILLIAM LEWIS, at the Office, No. 4, Wellington-street, Strand.

THE ATHENÆUM

AND

LITERARY CHRONICLE.

No. 85.

LONDON, WEDNESDAY, JUNE 10, 1829.

Price 8d.

THE DUKE OF ORLEANS AND SIR OLIVER KYNASTON.—A DIALOGUE.

[The following paper came into our hands by mere accident. We suspect that it was originally reported for 'The Court Journal'; but that, finding it to relate to literature rather than fashion, the judicious Editor of that publication declined to insert it. We have no doubt that he consulted the taste of his readers; but it seems probable that he was also influenced by the more generous wish to save the character of the Duke of Orleans from the imputation of carrying into later life those literary habits which made his earlier years so striking a contrast to that of all the other Royal exiles on record, since the days of Dionysius. Not having this tenderness for the estimation of the Duke in the circles to which 'The Court Journal' is devoted, we venture to publish the conversation exactly as we received it, except that we were compelled, in some degree, to abridge it, and to translate into English several non-descript allusions of the Baronet, and a very few French ones of the Duke.]

SCENE.—Hotel.

The Duke of Orleans.—Yes, Sir Oliver, your description of what the Epsom Races are likely to be, makes me lament exceedingly that I cannot attend them. You said, I think, that you had betted largely on 'Client,'—was it Client?

Sir Oliver Kynaston.—(Taking a pinch of snuff, and colouring with indignation.)—'Patron,' may it please your Royal Highness, 'Patron.'

The Duke.—'Patron,' say 'Patron.' I beg pardon, Sir Oliver, for erring in so important a particular. You say you have betted largely on 'Patron,' for the Derby, and are quite sure of winning. I assure you I shall always reckon it one of the chief misfortunes of my life, (and you know I was for many years an exile) that I shall not witness the success of 'Patron.' In this, as in other respects, how much more fortunate is my son than his father! But, Sir Oliver, as we have talked for an hour or two, about your English races, will you favour me with a few minutes' conversation about your English literature. I think, in the dedication of the volume of juvenile poems by the son of your coachman, which you were so good as to give me, you are described as being not only K. C. B., and one of the Jockey Club, but also Doctor of Laws, Member of the Royal Society of Literature, and Fellow of All-Souls' College, Oxford.

Sir Oliver.—Yes, I have always made it a rule to encourage learning. Your Royal Highness must be aware that there is no more innocent relaxation. I have heard that thoughts make much more impression on the mind early in the morning than at any other part of the day; and when my nephew was put under my guidance about two years ago, I recommended to him always to keep a book on his dressing-table, that he might derive the greatest possible benefit from it by reading it when he was dressing to follow the hounds. I ventured to recommend Blair's 'Lectures on Criticism' as the standard work on polite literature in our language. Frederick, the young rogue, objected to my selection; 'for,' said he, 'the man who wrote the Lectures on Criticism, has written sermons!'—Ha! ha! ha! a curious blunder, to suppose them written by the same person. But Frederick's education had certainly been very much neglected before I took him in hand. Well, Frederick said that he would not read the Lectures on Criticism, because he had a decided objection to cant. No friend to the Church, I fear. However, I set him right on that point. I knew they could not be by the man who wrote the Sermons; for my grandmother used to read the Sermons, and the Lectures are quite a modern work. I assured Fred I had never seen them myself till about four years ago; and I have always taken all

the modern publications. At last, Frederick consented to read them, and he told me the other day, that he had nearly got through a volume. I believe, if your Royal Highness wishes for information as to the present state of English literature, I had better refer you to them than trouble you with my crude notions.

The Duke.—I have no doubt your views on the subject are highly original and curious.

Sir Oliver.—Why I must say there are some periodical works which might lead your Royal Highness into great mistakes. The opinions, for instance, of the persons who write 'The Athenæum' are to me perfectly incomprehensible.

The Duke.—Pray who is the most celebrated of the living English poets, now that poor Lord Byron is dead? Moore, is he not? I have had the pleasure of seeing him in Paris. An exceedingly lively and agreeable person.

Sir Oliver.—Very much admired by the Whigs; though some of them think Luttrell superior to him.

The Duke.—Indeed, his name is new to me. Victor Hugo once said to me that there is no more graceful and glittering writer in Europe than Moore.

Sir Oliver.—O! yes, of course. But Mr. Moore is of such small stature that I doubt whether he could even be admitted into the light cavalry.

The Duke.—Why, Sir Oliver, we must not exactly judge of men's military capacities by their stature; for Diomed, you know, and Alexander, and Frederick, and Buonaparte, were all short men. Mr. Moore would probably be found an exceedingly active Partisan Colonel.

Sir Oliver.—Ha! ha! your Royal Highness; ha! ha! good partisan!! Yes indeed; very violent partisan; takes liberties with the names of men of station and fortune in those d—d rhymes of his. My name, for instance, the name of Sir Oliver Kynaston once appeared in a stanza of his in 'The Times,' accompanied with epithets very disparaging to my intellect.

The Duke.—Kynaston—a remarkable name. I should think it would be rather difficult to find a rhyme for it. But have you not other poets in England of equal celebrity? I think I have seen at Paris the works of Wordsworth; is there not some one of that name?

Sir Oliver.—Yes, a man up in the North; supports my friend Lord Lowther. Right side in politics; but nobody reads him.

The Duke.—Singular that the booksellers should go on publishing new editions if nobody buys the book.

Sir Oliver.—O! they do it just as people keep betting on a horse that has not a chance of winning. I have seen it done a hundred times. Only yesterday now, that mad fellow Forth—

The Duke.—Yes, yes; I see. Every body has not your sagacity, Sir Oliver, in pitching on *Gli-Patron*. But pray is Wordsworth unpopular because he is too excellent for the crowd, or because he is too bad even for them? De ja Martine says, that he is a very remarkable man. Perhaps he is less read than he ought to be from some dislike on his part to vulgar artifices of style; and from his poetry being such that a little thought is necessary to understand it.

Sir Oliver.—I really cannot say. I make it a point never to read any thing that is not the fashion. My wish is to keep pace with the mind

of the age. Then, your royal Highness, there is Campbell, a poet of wonderful genius; indeed, in my opinion, quite sublime. In 'The Pleasures of Hope,' he has the couplet,

'When murder bares her arm, and rampant war
Yokes the red dragons of her iron car.'

Very strong lines those indeed. It has sometimes occurred to me, however, that *arm* is seldom used in the singular for a weapon. Rather forced, is it not, to say 'bare an *arm*,' by way of 'draw a sword?' Though, perhaps, in fact the phrase may be a nautical allusion. I have heard sailors say *bear a hand*, and perhaps the reading ought to be 'bears her arm.' Then, again, in the second line, I remember agreeing with my old friend General Wise, that *dragons* certainly was meant to be *dragoons*. One word, I think, expresses both in French, and Campbell happens to have selected the wrong translation. It cannot be a mistake of the printer; for, if we were to read *dragoons*, the accent would fall on the wrong syllable. But that I am willing to allow all possible authority to poetic licence, and to give ample room for the beautiful irregularities of genius, I should decidedly condemn a poet for thus sacrificing the sense to the sound.

The Duke.—There certainly is a considerably difference between the dragon, and that eminent dragoon officer, St. George, who killed it.

Sir Oliver.—My friend Sir George Nagle explains the words as relating to the phrase '*rouge-dragon*,' the title, I think, of some herald. So that he too believes *dragons* to mean men. He supports his opinion that the passage is heraldic, by referring to the word '*rougeant*' in the previous line. But I still think that General Wise and myself were right in supposing the couplet to be an allegorical picture of a cannon or tumbril, we could not agree which, surrounded by a squadron of horse. A very acute critic was General Wise. He detected an error in another passage of Campbell, where the poet says,

'Wave, Munich, all thy banners wave,
And charge with all thy chivalry!'

On this he observed, that the word certainly is *cavalry*. I remember we studied the history of the battle, and could find no authority whatever for '*chivalry*,' while *cavalry*, on the other hand, would be perfectly neat and appropriate. To be sure, Wise was a Cavalry-officer, which gave him an interest in the matter.

The Duke.—Have you not in your language 'The Pleasures of Memory,' as well as 'The Pleasures of Hope'?

Sir Oliver.—Certainly. The poem is by Rogers, a banker, and rather a pale person. I have met him several times; but I do not know how it was that we could not very well understand each other. I ventured to make a few remarks on particular points in his poetry, which I thought he might have improved under the guidance of a judicious friend. But he did not seem at all to perceive the force of my remarks. In a poem of his called 'A Wish,' he says,

'The village church among the trees,
Where first our marriage vows were given,
With merry peal shall swell the breeze,
And point with taper spire to heaven.'

Now it occurred to me that I had never heard the phrase, 'to give a vow,' and I thought, perhaps, 'vows' might be printed in mistake for 'fees.' The sense would run, 'the village church where our marriage fees were given (that is, paid) to the

clergyman,' and would be quite unexceptionable. Well, I took the trouble to explain and enforce my views to Mr. Rogers, and he made an attempt to turn off the business with a joke, though I must say, that, when he attempted to laugh, his face hung fire most absurdly. Well, the next day I heard some one humming in St. James's-street a doggerel couplet:

'Oliver Kynaston! Oliver Kynaston!
The brains in your head are no more than are in a stone!'

I traced them to him, the ungrateful blockhead! But any one may see it was done out of revenge for my superior penetration. I would not have mentioned the matter to your Royal Highness, but that his conduct has freed me from all obligation to conceal his wretched poetical blunder.

The Duke.—Pray, have you ever seen Sir Walter Scott?

Sir Oliver.—Yes; several times when I was shooting in the North. He is rather a tall, plain-looking man, and understands sport as well as if he had never published a book. But I suppose he only writes on rainy Sundays. I am afraid if he should ever have the honour of seeing your Royal Highness, and you should condescend to ask him any questions on literary subjects, you would be able to derive very little information from him. I do not remember a single observation he made in my presence, except something about the price of black cattle, and an admirable hint or two on trout fishing. I have always regretted exceedingly, that with his love of sport, and his knowledge of game, he has not made it the business of his life to write a defence of the Game Laws, instead of wasting his time on frivolous and fictitious topics.

The Duke.—Well, Sir Oliver, I am much obliged to you for the information you have given me about the modern literature of England. My son stays here for some weeks, and I am sure he will be delighted to hear your views of the philosophy of Britain, as fully stated as those you have favoured me with about its poetry.

LANDOR'S IMAGINARY CONVERSATIONS.

Landor's Imaginary Conversations. Second Series.
2 vols. 8vo. Colburn. London, 1829.

(Continued from p. 340.)

In the dialogue between Archbishop Boulter and Philip Savage, which follows the one upon which we commented in our last article, Mr. Landor, we rejoice to say, shows that, in his better moods, he can respect the virtues even of an Irish churchman. He has thought it necessary, however, to excuse his liberality in a note, upon the score of the ecclesiastic having been a gentleman and an ancestor of the author of the 'Imaginary Conversations.'

A conversation on the Giraffe, the Bourbons, and the Greeks, between M. Villèle and M. Corbière,—the satire of which would be much more effective if the author had been able to keep his temper in writing it,—precedes two dialogues which are illustrations of Mr Landor's tendency, and of the resistance which it encounters from the atmosphere by which it is encircled, and are, perhaps, the most interesting in either of these volumes. The interlocutors in the first of them are Lady Lisle and Elizabeth Gaunt, two of the victims in Monmouth's insurrection. It is written with exquisite feeling, but it is very short; and we are almost bound to quote it, lest we should be supposed to entirely hide from our readers those parts of Mr. Landor's writings which seem to militate against our theory.

'LADY LISLE.

'Madam, I am confident you will pardon me; for affliction teaches forgiveness.

'ELIZABETH GAUNT.

'From the cell of the condemned, we are going, unless my hopes mislead me, where alone we can receive it.

'Tell me, I beseech you, lady! in what matter or manner do you think you can have offended a poor sinner such as I am. Surely we come into this dismal place for our offences; and it is not here that any can be given or taken.

'LADY LISLE.

'Just now, when I entered the prison, I saw your countenance serene and cheerful: you looked upon me for a time with an unaltered eye: you turned away from me, as I fancied, only to utter some expressions of devotion; and again you looked upon me; and tears rolled down your face. Alas! that I should, by any circumstance, any action or recollection, make another unhappy. Alas! that I should deepen the gloom in the very shadow of death.

'ELIZABETH GAUNT.

'Be comforted: you have not done it. Grief softens and melts and flows away with tears.

'I wept because another was so greatly more wretched than myself: I wept at that black attire; at that attire of modesty and of widowhood.

'LADY LISLE.

'It covers a wounded, almost a broken heart: an unworthy offering to our blessed Redeemer.

'ELIZABETH GAUNT.

'In his name let us now rejoice! let us offer our prayers and our thanks at once together! we may yield up our souls perhaps at the same hour.

'LADY LISLE.

'Is mine so pure? have I bemoaned, as I should have done, the faults I have committed? have my sighs arisen for the unmerited mercies of my God? and not rather for him, the beloved of my heart, the adviser and sustainer, I have lost!

'Open, O gates of Death!

'Smile on me, approve my last action in this world, O virtuous husband! O saint and martyr! my brave, compassionate, and loving Lisle!

'ELIZABETH GAUNT.

'And cannot you too smile, sweet lady? are not you with him even now; doth body, doth clay, doth air, separate and estrange free spirits? Bethink you of his gladness, of his glory; and begin to partake them.

'O! how could an Englishman, how could twelve, condemn to death, condemn to so great an evil as they thought it and may find it, this innocent and helpless widow!

'LADY LISLE.

'Blame not that jury! blame not the jury which brought against me the verdict of guilty. I was so: I received in my house a wanderer, who has fought under the rash and giddy Monmouth. He was hungry and thirsty, and I took him in. My Saviour had commanded, my King had forbidden it. We must bend to the authority of both; but first to the earlier, and most willingly to the better.

'Yet the twelve would not have delivered me over to death, unless the judge had threatened 'em with an accusation of treason in default of it. Terror made them unanimous: they redeemed their properties and lives at the stated price.

'ELIZABETH GAUNT.

'I hope at least the unfortunate man whom you received in the hour of danger may avoid his penalty.

'LADY LISLE.

'Let us hope it.

'ELIZABETH GAUNT.

'I too am imprisoned for the same offence; and I have little expectation that he who was concealed by me hath any chance of happiness, although he had escaped. Could I find the means of conveying to him a small pittance, I should leave the world the more comfortably.

'LADY LISLE.

'Trust in God; not in one thing or another, but in all. Resign the care of this wanderer to His guidance.

'ELIZABETH GAUNT.

'He abandoned that guidance.

'LADY LISLE.

'Unfortunate! how can money then avail him!

'ELIZABETH GAUNT.

'It might save him from distress and from despair, from the taunts of the hard-hearted and from the inclemency of the godly.

'LADY LISLE.

'In godliness, O my friend! there cannot be inclemency.

'ELIZABETH GAUNT.

'You are thinking of perfection, my dear lady; and I marvel not at it; for what else hath ever occupied your thoughts! But godliness, in almost the best of us, often is austere, often uncompliant and rigid, prone to reprove than to pardon, to drag back or thrust aside than to invite and help onward.

'Poor man! I never knew him before: I cannot tell how he shall endure his self-reproach, or whether it will bring him to calmer thoughts hereafter.

'LADY LISLE.

'I am not a busy idler in curiosity; nor, if I were, is there time enough left me for indulging in it; yet gladly would I learn the history of events, at the first appearance so resembling those in mine.

'ELIZABETH GAUNT.

'The person's name I never may disclose; which would be the worst thing I could betray of the trust he placed in me. He took refuge in my humble dwelling, imploring me in the name of Christ to harbour him for a season. Food and raiment were afforded him unsparingly; yet his fears made him shiver through them. Whatever I could urge of prayer and exhortation was not wanting; still, although he prayed, he was disquieted. Soon came to my ears the declaration of the king, that his Majesty would rather pardon a rebel than the concealer of a rebel. The hope was a faint one: but it was a hope; and I gave it him. His thanksgivings were now more ardent, his prayers more humble, and oftener repeated. They did not strengthen his heart: it was unpurified and unprepared for them. Poor creature! he consented with it to betray me; and I am condemned to be burnt alive. Can we believe, can we encourage the hope, that in his weary way through life he will find those only who will conceal from him the knowledge of this execution? Heavily, too heavily, must it weigh on so irresolute and infirm a breast.

'Let it not move you to weeping.

'LADY LISLE.

'It does not: oh! it does not.

'ELIZABETH GAUNT.

'What then?

'LADY LISLE.

'Your saintly tenderness, your heavenly godlike calmness.

'ELIZABETH GAUNT.

'No, no: abstain! abstain! it was I who grieved: it was I who doubted. Let us now be firmer: we have both the same rock to rest upon. See! I shed no tears.

'I saved his life, an unprofitable and (I fear) a joyless one: he, by God's grace, has thrown open to me, and at an earlier hour than ever I ventured to expect it, the avenue of eternal bliss.

'LADY LISLE.

'O, my angel! that strewest with fresh flowers a path already smooth and pleasant to me, may those timorous men who have betrayed, and those misguided ones who have persecuted us, be conscious on their death-beds that we have entered it, and they too will at last find rest.'—Vol. i. pp. 139—145.

Is it possible to conceive any thing much more lofty and spiritual in conception than this dialogue? And how is it possible that after reading it we can still maintain that Mr. Landor's mind has an habitual inclination to dwell among the forms of animal life? We still think our hypothesis is not inconsistent with even this evidence; and, if our readers shall think otherwise, we at least claim credit for the extreme honesty which has rendered an attempt to reconcile them necessary.

There is no conception which has so entirely departed from us, and which it is so difficult to revive, as that of the standard of female perfection as it existed among the ancients. We do not mean that it is impossible for us, with our Christian eyes, to contemplate, and admire, and reverence, and all but love, the Antigones and Electras of the Greek drama. As long as we retain any true feeling of the beautiful, till we become converted into mere worshippers of the idols around us,—a state immediately preceding that in which we lose all perception even of what is lovely in them,—so long shall we continue to visit those shrines, and to find, each time we bow down before them, fresh supplies of strength and purity. But the

most exquisite of these exquisite beings can never become an abiding presence with us. They live in their distant world; and our communion with them, though sacred, can never be friendly. It is only in our intercourse with such creatures as

'The lonely lady married to the moon,
And gentle Una with her milk-white lamb,'

that affection and tenderness are blended with adoration and wonder. Look at all the attempts which have been made to produce casts in the spirit of these ancient models. Look even at the 'Iphigenia' of Goethe, who, as was remarked in a late number of 'The Athenæum,' has, at the price of sacrificing a portion of his individual nature, evinced the power of comprehending more varieties of human nature than any artist at least in our day. There is probably no modern conception of the ancient female character in the whole so true as this—one in which so much reality and life are combined with so much classical correctness; and yet, even there, the effect to reconcile the two conceptions is very obvious, and painful, and often unsuccessful. Sometimes the poet's art gets the better of his feeling, and then the classical elements gain the ascendancy, and a frigidity perfectly unlike anything we meet with in Sophocles is the result: sometimes his feeling is victorious over his art, and then Iphigenia, ceasing to be a Greek, becomes a modern, Shakspearean, Christian, woman.

A still more striking instance of the difficulty which great poets experience in realizing this conception, is Wordsworth's *Laodamia*. Wordsworth, a poet who has a notorious distaste, and almost an acquired incapacity, for dealing with love, has selected for the subject of that exquisite poem, wherein he wished to be strictly classical, one of the few fables which enabled him to introduce a female of that world, under the influence of those passions which are in general so alien from his disposition,—feeling, no doubt, that this additional excitement was needed in order to give him the same interest in a Greek woman, with which he is naturally inspired by the homely emotions and quiet lives of his Margarets and Emilies. And if great men have found difficulties in the experiment, the blunders of little men who have repeated it after them, have been melancholy and disgusting. One half of them—who are called classical, and upon the strength of that reputation are admired by young ladies and made professors of poetry at Oxford—merely take from the fair creatures of our own land all their love, and tenderness, and passion, and then say, Behold a Greek! If there is any person who believes them, we should not despair of convincing him, that a picture of Titian, *minus* the colouring, and warmth, and beauty, is the same thing as a statue of Praxiteles. Another and opposite method is that of which Mr. Leigh Hunt, though not the originator, has been the chief apostle in this country. They who pursue it hold, that Christianity has introduced into the world a great many inconvenient restraints upon the freedom of women's feelings, and of the intercourse between the sexes. 'Let us, therefore,' they argue, 'take these restraints away from the women of the present day, and what will remain? A Greek, to be sure,—a beautiful, languishing, loving, sensual Greek, who gratifies the instincts of her warm heart, and was never plagued with notions of sin or warnings of futurity.' And there are men who in good faith think this a Greek ideal—one in which Sophocles would have delighted; who really are not aware that the Greek standard was vastly more stately and severe than the Christian, and that the difference consists in the one being a mere ideal, inhabiting a sphere in which mortals could never dwell, and therefore exerting no influence over their daily pursuits and habits; and the other being a divine-humanity—like ourselves as well as like God—connected with us by a ladder set on earth and reaching heaven, upon which the angels are ascending and descending continually.)

It was natural that one so imbued with the classical spirit as Mr. Landor, should shrink from either of these abominable interpretations; it was natural that, with his reverence for the Greek model, he should fear to desecrate it while attempting to imitate; and it is natural that, surrounded as he is by the sorrowful and spiritual beauty of so many Madonnas and Magdalens, his mind should be somewhat reluctant to dwell constantly in a region from which they are excluded. It is not unnatural, finally, that he should at last, as others have done before him, make a compromise with their Pagan consciences, to retain just this one weakness, to allow that one being in the world is the more lovely and beautiful for possessing a soul; and to account for the spiritual atmosphere with which all creation is surrounded, by supposing it invented as a medium for her to breathe and live in.

Having talked so much about Greek girls, we must introduce a passage from the beautiful dialogue in which one of them, a modern one indeed, takes part.

'TERTITZA.

'White doves are always very white indeed: and those great water-birds, to which the angels by God's order have given the same pure appearance, feel a pleasure in possessing it, look at it upon them, curve their necks over it, and lay their heads now along it and now under it, as if it soled and supported and refreshed them.

'ODYSSEUS.

'Hast thou lived thirteen years and knowest not yet these birds?

'TERTITZA.

'I know them very well; though I never saw but two; and you remember where.

'ODYSSEUS.

'Not I indeed, child!

'TERTITZA.

'Have you, who are so many years older, so bad a memory? It is strange you should have forgotten those tall noble beautiful creatures; particularly one of them: think again.

'ODYSSEUS.

'Where was it? and when?

'TERTITZA.

'Oh! that now, dear brother, that is quite impossible: all pretense and dissembling! You might perhaps not know exactly *where*: but *when*... indeed, indeed now, that is quite impossible.

'ODYSSEUS.

'Remind me a little; give me an idea of it; a circumstance belonging to it.

'TERTITZA.

'It was in the beginning of spring, only five months ago, while we were sitting, several of us together, on a stone engraven round with goats'-heads, in the ruins of Cheronea.

'Now cannot you recollect?

'ODYSSEUS.

'Not perfectly.

'TERTITZA.

'You must be very tired with the ride, or heavy with the sunshine, or thinking of other things, or uncommonly dull and fit to think of nothing. Why! it was only four days before our guest joined us. Ho! now you begin to come to yourself again. Well may you smile at having so short a memory. I recollect it the better, because you were rather angry with me for being sorry I could not go to church, there being none to go to; and for saying it was a pity to waste so sweet a morning in the open air, instead of thanking God for it, and singing to him, and adoring him.

'ODYSSEUS.

'I never am angry with thee, my sweet little sister, and I am sure I could not be for that expression.

'TERTITZA.

'No, you never are angry with me; but when I am sorry you sometimes say you shall be.

'Well; did not the stranger go to church with us the next Sunday, at Athens? and did not I tell you I was quite as happy as if I had been there the Sunday before?

'ODYSSEUS.

'Nonsense! nonsense! what has that to do with two swans?

'TERTITZA.

'Now then you can think about 'em, can you! I knew it was only deceit in you: I have found you out.

'ODYSSEUS.

'The swans appear to have made a deep impression on your imagination.

'TERTITZA.

'The nobler one came sailing up from the lake, as swiftly and steadily as if some wind had blown him, though there was not a breath upon the water, and looked as if the place were his own, far and wide, and we were there by his gracious permission. It was only when he rowed among the grass and flowers, covered with cups white and yellow, as though a feast had been prepared for his reception, that I perceived he had any thing underneath to move with. We then heard some low and hoarse voices; and presently came out his mate, slenderer, and less beautiful, arranged her plumage, went down a little way, returned again, sat motionless opposite us, and seemed courting us not to hurt or disturb him. Agatha said that they had their nest there, under the bank: that their voices are not always low and hoarse: that when they are about to die, they sing delightfully. I was very glad the poor creatures had many years yet to live: for they certainly had made no progress in their singing. But there are birds, perhaps, as bad as we are; birds that will learn nothing from those they do not like.

'ODYSSEUS.

'Come on, come on, my beloved little Tertsitza! thou too hast some things to learn; haply some painful ones; and we are near the school-room.

'TERTITZA.

'The cavern?

'ODYSSEUS.

'Ay, there are caverns where the water itself ceases to drop, and is liquid no longer. Thou also must grow somewhat harder in this solitary and inaccessible one of ours, my sister!

'TERTITZA.

'I am sure I cannot; every thing is so beautiful about it; and my dear brother too will be always nigh me. The waters that petrify must meet (as old men tell us) with something hard in their way: I find nothing but pleasure.

'ODYSSEUS.

'Pleasure itself hardens some hearts.

'TERTITZA.

'How is that? I think I can guess: I think I have discovered it. Greyhounds are very good creatures, and look gentler than lambs; no animal upon earth is more beautiful: yet they always grow obdurate by the pleasure they take in coursing the hare and antelope. If they would run after nothing, and be contented to stand quiet and be caressed, they would be much better. I am certain they must be happier when they have no others to pursue; and I wish it pleased God to give them sense enough to know it. Have you never seen how they pant? how their hearts beat in their deep breasts? how indifferent and insensible they appear to their best friends, who love them most and who would call them away? They forget their own nature, and even their own names, their cruelty so deafens them.'—Vol. i., pp. 155—160.

We will skip over the five next dialogues, till we come to one between Diogenes and Plato. But of this we have many complaints to make; and, as our readers will not listen to them, after perusing the exquisite specimens we have afforded them of Mr. Landor's taste and feeling, we must move one more adjournment. Our next notice shall positively be the last.

STRATTON HILL.

Stratton Hill, a Tale of the Civil Wars. By the Author of 'Letters from the East,' 'Tales of the West of England,' &c., &c. 3 vols., post 8vo. Colburn. London, 1829.

THE reason is obvious for the non-existence of any first-rate English novel relating to the civil wars of the seventeenth century. Men of high talent, knowing the vastness and difficulty of the subject, abstain, and 'fools rush in,' &c. Sir Walter Scott, indeed, has made a feeble attempt in 'Woodstock.' He has aimed at exhibiting the character of but one of the great men of that age, (Cromwell,) and has miserably failed. It appears the less surprising that we have no poem or novel at all embodying the spirit of that noble generation, when we consider that of all the histories of the period in our language, there is not one which aspires to any thing more than the accurate narration of prominent facts, or the sup-

port, by practical examples, of some theory of monarchy or democracy. To describe the epoch from a study of itself, to show what were the thoughts, feelings, purposes, and convictions of the men who lived in it, has never been attempted by any writer whom we have had the fortune to hear of.

The period, however, of the military struggle between King and Parliament is so full of contrast and incident, that it could not fail to be seized on by many booksellers' operatives. The works answered, we presume, the purpose for which they were written; and our consciences do not reproach us for having sedulously purged our memories of their names, and of every thing else about them. We have a general impression of their merits, so strong as to enable us to assert, that, excepting 'Woodstock,' (which leaves the whole time untouched till after the death of Charles,) and De Foe's 'Memoirs of a Cavalier,' (which are chiefly remarkable for a literal copying of unimportant details, and consistent support of an uninteresting character,) there is no more busy or melo-dramatic novel on the same period than 'Stratton Hill.'

We have given it no high praise, for it aims at no high merit. The business of the author, writing, as we presume he does, for the great body of novel readers, was to be as furious and as descriptive as possible. We can honestly applaud many of his descriptions, and his passion is quite good enough for the persons whom (as we suppose) it is designed to interest. There is only one other element of a popular novel, namely, story; and as to this, the writer must look for unanimous astonishment, because his book contains not one complete narrative, but something between a dozen and twenty separate narratives, which we apprehend to have been written without any connection, and then flung into a box together, and sent to the printer's. He probably employed a boy to draw out the chapters at hazard, like as many lottery-tickets, and in that order printed and published them, prefixing 'Stratton Hill' in the title-page. We should have preferred to name the book 'Anecdotes, original and selected, of various persons known to Sir Beville Granville; interspersed with fragments of a description of the county of Cornwall.'

These descriptive fragments would probably, if published in a separate form, always continue to excite some interest. The characters and situations are better than those in ninety out of every hundred novels composed on the same plan, and annually published in London and Edinburgh. The utter want of sustained interest, or indeed of any unbroken thread whatever, in the book, together with a vagueness and incorrectness of language even in the present day almost unexampled, are sufficient to degrade the work from any high rank among our modern melodramatic novels.

The following extract is, we think, the best part of the book:

"After some hours, he arrived at a village not more than a few miles distant from the place of his destination, and here he resolved to pass the remainder of the night. The accommodations of the small inn, if such it might be termed, would scarcely have tempted the weary passenger to rest: he saw his favourite horse well fed and attended to, and then seated himself in a huge chair, the only one in the kitchen, to wait the approach of morrow. It came at last, and he willingly left his rude place of rest to resume his journey. The sun had risen ere he drew nigh the mansion of Stowe: no forest or moat spread their sluggish depth round the wall; or drawbridge, strictly sentinelled, started the wanderer's footsteps away. Its founders and improvers had not dreamed such defences could ever be needful in so remote and calm a territory. Armed men were gathered thickly, however, before the walls; and the look of many among them brightened as they saw the soldier alight at the gate. He paused a few moments to look at the array, and then passed hastily within. His reception by the numerous and distinguished tenants of the mansion was of the most cordial as well

as flattering kind; and when he cast his eyes round the long table, at which they now sat at their morning meal, he saw more than one, the report of whose deeds had been spread far and wide. The ancient hall was completely filled with guests, by whom the substantial cheer that loaded the board was heartily partaken of; for many had travelled far through the weary night with their few adherents, or had hastened alone at their utmost speed to the place of rendezvous.

The noble owner rose to meet his friend; and pressing his hand warmly, with a look that expressed more of the soul than any words could have done, introduced him to two or three leaders who were seated near him. The conversation that had been interrupted for a moment, was again resumed with great earnestness; the plans to be embraced, and that instantly, were discussed; for, as the Parliament's army were now advancing, and would soon be at hand, no time was to be lost. The neutrality agreed to had been broken, and the Earl of Stamford, with a force he thought sufficient to crush the Royalists, had received orders to enter the province, to intimidate rather than to fight, for he scarcely imagined they would dare to meet him in the field.

Sir Ralph Hopton was now lying at Launceston with a very inferior force, and it was resolved to march, with the levies which had now arrived, to join him there. It was easy for a man so extensively connected as Sir Beville Granville to assemble, at a short notice, a large body of adherents. The number of private gentlemen that came to his aid, induced by his persuasions, or attached to his family by the ties of blood, made this body more formidable by their quality and high courage, than by their numerical force. A regiment that he had raised at his own expense some time before, was the only well-disciplined portion of this little band that was now gathered around the mansion.

The repast being ended, the hall was quickly deserted; and all issued forth to the marshalling of the troops, regular and irregular. The latter presented, to an experienced eye, excellent materials, doubtless, to make hardy veterans of; but, at present, summoned from their moors and hills, and fierce and rough in all their native wildness, their garbs, or uniforms, were as various and strange as those of Falstaff's regiment; but the brawny chest, the naked and colossal neck, that would have rivalled those of any Saracen in the desperate bands of Omar; in fine, the "thwews and sinews" of these hardy peasants and miners, gave promise of the deeds they afterwards achieved. The whole of the day was passed in busy preparation to march on the morrow, and in forming the motley forces into the best order and array the time permitted.

The fresh and green turf of the sloping lawns bristled with the unwonted gleam of arms; and the broad walks rang with the heavy tread of armed men. On wall and tower was many a fair spectator of the show of battle. At intervals, small parties of men were seen hastening through the woods, or over the downs, to join the forces, armed with the first weapon they could lay their hands on; sturdy fishermen from the neighbouring coast were among them, who had left their cabins and their boats, and rushed to range themselves under their lord's standard. Seated on a low and grass-covered bank, on which he supported himself with his trembling hands, while his large eye was fixed intensely on the scene before him, was an old man, with a frame, even in ruins, like that of Hercules. It was Kiltor, the once-famous wrestler, and the tenant of the valley, or bottom, as it was called, of Combe, who had implored his ancient friend to have him conveyed hither, that he might gaze on the array, and smell the battle, as it were, afar off. As the weapons flashed in the sunbeams, his eye seemed to catch the glare, and he lifted his palsied hand in earnest approval, as Andrews, to whom he had given a night's shelter a few months before, oft marched past him at the head of a small body of men, whom he was intently engaged in instructing. The latter was in the full pride and pomp of his charge; his experience and long service made him a valuable aid on the present occasion; and the days of his youth seemed to come back to the veteran, as foot, voice, and gesture, kept time in his repeated march along the lawn.

"He's young again," muttered Kiltor, "and his pike will soon draw blood; and I'm withered, like the weeds upon this bank aneath me."—clenching, at the same time, some beautiful wild flowers into atoms in his hand.

At this moment, Sir Beville slowly drew nigh the spot on which he sat; the old man looked eagerly and

wistfully in his face, his own strong and miserable feelings giving way to the long and almost fœdral attachment to the family.

"Is it you, Kiltor?" said the former; "how have you contrived to leave your cottage, where you have been a home-keeper so many years?"

"I cudn't resist, my Lord, to look upon strife, or the show of it, once more afore I die. Tisna w' me now as in times long ower, when I ha' seen your young eye dance w' joy as this hand cleared one prime atter another out o' the ring."

"We all have our day, my friend," was the reply; "you have had yours, and fame enough too; you were long the first wrestler of your time, and others now have taken your place."

"They have, they have, and I'm alive to see it; mere shilderlins, Sir Beville; men o' lath, that wud na' ha' faced the grip o' my hand, or stood the clinch o' my limbs, more than with a withy, and the whole countrie is rummin' atter them—could I but be strong for one day, a prize day, as I was once, and shud see these hoastin' boys; one harled to his back, without a limb movin'; another w' broken bones; and, maybe, one goin' double all his life ater, alike Carter was for many years!" and he laughed short and fiercely at the cruel remembrance he had conjured up.

"Old man, age has not brought you mercy or kindness of heart; these are not feelings for one whom the grave is waiting for. Years have, in truth, fearfully changed you: I remember, it was when I was quite a child, Sir Richard, just returned from abroad, took me to see the contest in the ring.—It was you, Kiltor, that won the day."

"You remember that day?" said the wrestler exultingly, almost starting from the ground, though the movement gave him great pain: "it was for the tankard, my Lord, the silver tankard that your grandsire put up for the whole county. 'Twas a hard-folt day, and I did na' ken your eyes saw it; then ye saw, one after the other, flinged upon the yerth, like the broken ore from the kibbal: my bones were like iron, and my joints like brass—look at me now, my Lord! wad ye ken me for the same?—but ye'll ne'er see another day like that in the ring."

"I should know that giant frame again," Sir Beville said; "it was free and supple then, and formed in the finest symmetry: there were others as tall and stout, but none took my childish fancy so much, and my grandsire was loud in his praises."

Kiltor clasped his hands firmly together, and the big tears slowly coursed down his hard face, all unwonted: the praises of his noble patron, whom he had not seen for many long years, during which praise had never reached his ear; the memory of that day of triumph, on which such lips had dwelt, brought happier and better times back, ere disappointment and disease had overcome him.

"I was all that: few so fine made, and none so strong. Blessin' upon the words that said it; the eye followed ater me when I past by; they gathered from the east and the west round the ring, all asked the furst thing, 'Where's Kiltor, the champion?' and the said wemmen pointed me out to the young and comelie ones. 'Twas upon Stratton Down, my last field!—all day under a burnin' sky we wrestled, and I got many a hard fall; but when the last man was throwed, they carried me away in their arms to the village. There Cattern, my young wife, the boast of the whole parish, waited for me. You never saw her dark eyes in its strength; how it looked upon me so in love and pride that day! We had a carouse that evenin', and I drank hard, and then went with her to our home in the Coombe; not dreamin' that I shud ne'er rejoice again. Towards mornin' I woke, the dead palsy had seized my side, and all my strength past from me, and never, never came again. I cried loud, and tossed my arms, but my body was like a lost man's driftin' upon the wave, or like Victor's when I pitched an dead in the ring, with his back furrowed in the grass?"

"And did you never recover, George, your health and strength again?"

"They went from me in a moment, like a judgment from Heaven, as I said; and my limbs got cold and heavy like lead, and hanged from my body like the shoten branches of an ould oak. Cattern cried over me day and night, and tended me like an infant: but hy lities I got to hate her; her dark eye and sorrowin' face were always afore me, and sometimes I tho't they mocked me; and she changed from that time, like me: her beauty wasted like the froth o' the sea: she's ould now and fierce, an' unhappy like me, the once milke and mistreated woman. They came to my dwellin', one day, once a month ater that, the wrestlers from

the other parish; for there was a wrastlin' 'greed upon, and they did na' ken my affliction. The Germoe men were among them, my ould rivale, burnin' at their bein' overcome; they challenged me to come forth to dare them 'pon the morrow, and their eyes gloated ower my helpless state; I saw them look hard and joyin' at one another, and then they mocked me wi' their words, and my friends were sad and downcast.—Oh my Lord, is it any wonder if my blood turned to gall? I gnashed my teeth and cursed them; and from that hour my heart changed like my body, and I ne'er spoke a kind word, or theft a merciful thought afterwards; 'twas that hour that broke Cattera's heart, and seared my own like a nether millstone?"

"Wretched man!" said his noble auditor; "your life has, in truth, little left to desire; and what can death, with such passions, hope for?"

"The feelings o' my youth are still strong; I ha' borne too long a livin' death to make me fear to give up my breath. I ha' but one hope: to see a stricken field, my Lord, afore I die; the clashin' o' swords, the hard strife o' men strugglin' for the life of others; the drownin' o' voices—the ring is nothing to that."

"For shame, Kiltor, to feel thus on the brink of the grave; go home, and strive for good-will to others, instead of desiring scenes of blood. You should have any relief or comfort that I can bestow to soothe your condition; but you do not want this world's good, I believe; is not the tenement in the valley your own?"

"It is, it is; and I want no more, as you are pleased to say;—many thanks to the house that ha' fedded me and my fathers afore me!"

"It is strange," thought Sir Beville, as he turned from the spot, "how the passions out-live the strength! Well I remember this man, so noted in his day, and still he hovers like a vulture round the carcass from which he is driven."

"The latter looked earnestly after the retreating form of the nobleman, with his lips moving like those of a man who sees the friends of his past life in a painful dream. "Like Sir Richard," he muttered; "the same stately step, and eye that cannot be resisted in kindness or anger. His foughten field I'll see, though my eyne look their last upon it." He then turned to gaze on the array around him with an intense interest that absorbed every other feeling.

"Several hours had passed away in the busy and exciting duties around the walls, in which every one, whatever his rank, took the liveliest interest. Those who had come without arms were furnished from the store the mansion afforded, not out of its armoury, but from the supplies which had with great quickness and foresight been provided. Time there was not, to give any discipline to the raw peasantry; who, it was decided, would be more efficient, if left to act as a separate body, than by being incorporated with the well-trained regiment.—Vol. I., pp. 175—188.

LECTURES ON SCULPTURE.

Lectures on Sculpture, by John Flaxman, Esq., R.A., Professor of Sculpture in the Royal Academy of Great Britain, &c.; with a brief Memoir of the Author. Pp. 339, royal 8vo. Murray. London, 1829.

In no one particular is the national pride of the British traveller on the Continent more frequently wounded than in his views of the merit of the artists of his native island. The complaisance, evidently incredulous, most provokingly polite, with which your dilettante, nay, even your connoisseur, of Venice, of Florence, or of Rome, will listen while an Englishman asserts the claim of his country to take rank with the nations in which the fine arts have been encouraged and cultivated with success, furnishes, probably, the most arduous trial which the patience of a tourist on the Continent has to endure during the first year or two of his pilgrimage. In vain he cites the names of Banks, Hogarth, Wilson, Gainsborough, Reynolds; in vain he describes the qualities, and descants on the merits, of the works of these masters, the ornament and pride of Britain: a smile which the most courtly breeding but half conceals, and which receives double force from the affected attempt to suppress it, shows him at once that his enthusiasm is ascribed to nationality, and is excused, if the ignorance it is assumed to betray be not pitied, as an amiable and pardonable prejudice, more honourable to the heart than to the taste

and understanding of the speaker; more creditable on the score of patriotism than of judgment or experience. One name, however, there is which an Englishman may mention with safety, which he may venture to appeal to without the risk of being affronted by the indulgence of his hearer; to which, on the contrary, he may refer with the certainty of finding a ready and warm acquiescence in his most fervent applause:—that name is FLAXMAN.

The designs of the late Professor of Sculpture of the Royal Academy of Great Britain in illustration of Homer, Æschylus, and Dante, are known throughout the civilised world; and wherever they are known, the esteem in which they are held, equals, if it do not exceed, the honour which they have received in the land to which the artist who composed them owed his birth. Such are their merits, indeed, and so amply is their excellence admitted, that, while they vindicate the claim of England to be considered a country in which the fine arts are really felt and understood and practised, the readiness with which the admiration they excite is avowed by the foreigner, must acquit him of wilful prejudice and ignorance in previously demurring to a claim in which he concurs as soon as so good a title to it is preferred.

It is of this first, and only English artist of continental reputation, that the lessons in which he essayed to instruct others in the art which he practised himself with such extraordinary *éclat*, are now before us. They suggest reflections which it would be in vain to attempt to compress within the limits allotted to a review in the columns of 'The Athenæum.' We must almost confine ourselves, therefore, in this and the succeeding Number, to the duty of presenting our readers with specimens of the quality of the work, by extracting such passages as appear most calculated to excite interest, to convey information, or to inculcate sound taste in matters of art. The degree in which the lectures correspond with the reputation of Mr. Flaxman, and with his merit as an artist, may form the subject of a few observations before our review of the work be closed.

The following sketch of the condition of the art of sculpture in England, during the gradual progress towards its revival on the Continent, and especially in Italy, is not less interesting than gratifying to national pride, and is the more satisfactory since it is the result of the observations of such a man as the deceased Professor, whose acquaintance with the highest productions of art was profound, and whose well-grounded predilection for Greek forms removes the most distant suspicion of partiality.

"The Saxons destroyed the works of Roman grandeur in Britain, burnt the cities from sea to sea, and reduced the country to barbarism again; but when these invaders were settled in their new possessions, they erected poor and clumsy imitations of the Roman buildings themselves had ruined."

"The Saxon Painting is rather preferable to their Sculpture, which, whether intended to represent the human or brutal figure, is frequently both horrible and burlesque. The buildings erected in England, from the settlement of the Saxons to the reign of Henry I., continued nearly the same plain, heavy, repetitions of columns and arches. So little was Sculpture employed by them, that no sepulchral statue is known in England before the time of William the Conqueror.

"In the beginning of the sixth century, when the Franks and Germans began to establish themselves in Gaul, they buried their sovereigns in plain stone coffins, without any exterior distinction or inscription, the name of the deceased being written on the inside of the cover. This was done to prevent the tomb being violated for the sake of jewels and other valuables which accompanied the royal corpse,—a common practice in those unsettled barbarous times. Afterwards, in the reign of Charlemagne, who was contemporary with our King Edgar, the French began to decorate the outside of their tombs with statues of the deceased and other ornaments, bearing some resemblance to the Roman manner. These are the accounts of the best French Antiquaries, Montfaucon, Buillant, and Felibieu; and they may be understood as invariably."

"Immediately after the Norman conquest figures of the deceased were carved, in bas-relief, on their grave-stones; examples of which may be seen in the cloisters of Westminster Abbey, representing two abbots of that church, and in Worcester Cathedral those of St. Oswald and Bishop Wulstan.

"The Crusaders returned from the Holy Wars; eager to imitate the arts and magnificence of other countries, they began to decorate the architecture with rich foliage, and to introduce statues against the columns, as we find in the west door of Rochester Cathedral built in the reign of Henry I.

"Architecture now improved; Sculpture also became popular. The custom of carving a figure of the deceased in bas-relief on the tomb seems likely to have been brought from France, where it was continued in imitation of the Romans. Figures placed against columns might also be copied from examples in that country, of which one remarkable instance was a door in the church of St. Germain de Prez in Paris, containing several statues of the ancient Kings of France, projecting from columns; a work of the 10th century, of which there are prints in Montfaucon's Antiquities.

"Sculpture continued to be practised with such zeal and success, that in the reign of Henry III. efforts were made deserving our respect and attention at this day.

"Bishop Joceline rebuilt the Cathedral church of Wells from the pavement; which having lived to finish and dedicate, he died, in the year of our Lord 1242. The west front of this church equally testifies the piety and comprehension of the bishop's mind; the sculpture presents the noblest, most useful, and interesting subjects possible to be chosen. On the south side, above the west door, are alto-reliefs of the Creation, in its different parts, the Deluge, and important acts of the Patriarchs. Companions to these, on the north side, are alto-reliefs of the principal circumstances in the life of our Saviour. Above these are two rows of statues larger than nature, in niches, of kings, queens, and nobles, patrons of the church, saints, bishops, and other religious, from its first foundation to the reign of Henry III. Near the pediment is our Saviour come to Judgment, attended by angels and his twelve apostles. The upper arches on each side, along the whole of the west front, and continued in the north and south ends, are occupied by figures rising from their graves, strongly expressing the hope, fear, astonishment, stupefaction, or despair, inspired by the presence of the Lord and Judge of the world, in that awful moment.

"In speaking of the execution of such a work, due regard must be paid to the circumstances under which it was produced, in comparison with those of our own times. There were neither prints, nor printed books, to assist the artist; the sculptor could not be instructed in anatomy, for there were no anatomists. Some knowledge of optics, and a glimmering of perspective, were reserved for the researches of so sublime a genius as Roger Bacon, some years afterwards. A small knowledge of geometry and mechanics was exclusively confined to two or three learned monks, in the whole country; and the principles of those sciences, as applied to the figure and motion of man and inferior animals, were known to none! Therefore this work is necessarily ill drawn, and deficient in principle, and much of the sculpture is rude and severe; yet, in parts, there is a beautiful simplicity, an irresistible sentiment, and sometimes a grace, excelling more modern productions.

"It is very remarkable that Wells Cathedral was finished in 1242, two years after the birth of Cimabue, the restorer of Painting in Italy; and the work was going on at the same time that Nicolo Pisano, the Italian restorer of Sculpture, exercised the art in his own country: it was also finished forty-six years before the cathedral of Amiens, and thirty-six years before the cathedral of Orvieto was begun; and it seems to be the first specimen of such magnificent and varied sculpture, united in a series of sacred history, that is to be found in Western Europe. "It is, therefore, probable that the general idea of the work might be brought from the East, by some of the Crusaders. But there are two arguments strongly in favour of the execution being English; the family name of the Bishop is English, "Joceline Trotteman;" and the style, both of sculpture and architecture, is wholly different from the tombs of Edward the Confessor and Henry III., which were by Italian artists.

"The reign of Edward I. produced a new species of monument. When Eleanor, the beloved wife of that monarch, died, who had been his heroic and affectionate

companion in the Holy War, he raised stone crosses of magnificent architecture, adorned with statues of his departed queen, wherever her corpse rested on the way to its interment in Westminster Abbey. Three of these crosses still remain, at Northampton, Geddington, and Waltham; the statues have considerable simplicity and delicacy; they partake of the character and grace particularly cultivated in the school of Pisano, and it is not unlikely, as the sepulchral statue and tomb of Henry III. were executed by Italians, that these statues of queen Eleanor might be done by some of the numerous travelling scholars from Pisano's school.

'The long and prosperous reign of Edward III. was as favourable to literature and liberal arts, as to the political and commercial interests of the country. So generally were painting, sculpture, and architecture encouraged and employed, that, besides the buildings raised in this reign, few sacred edifices existed which did not receive additions and decorations. The richness, novelty, and beauty of architecture may be seen in York and Gloucester Cathedrals, and many of our other churches; besides the extraordinary fancy displayed in various intricate and diversified figures which form the mullions of windows, they were occasionally enriched with a profusion of foliage and historical sculpture, equally surprising for beauty and novelty.

'In the chancel of Dorchester Church, near Oxford, are three windows of this kind; one of which, besides rich foliage, is adorned with twenty-eight small statues relating to the genealogy of our Saviour, and the other two with alto-reliefs from acts of his life.

'It would be endless endeavouring to enumerate the various examples of the passion for sculpture which prevailed in this age. In the Lady Chapel of Norwich Cathedral all the key stones, twenty or thirty in number, are beautiful alto-reliefs from the Virgin Mary's life: three sides of the cloister, belonging to the same church, have key-stones, (perhaps one hundred and fifty in number,) representing principal passages from the Old Testament as well as the New.

'There is a frieze of historical subjects entirely round St. Mary's Church, belonging to Ely Cathedral.

'The monuments of Aylmer de Valence, Earl of Pembroke, and Edmund Crouchback, in Westminster Abbey, are specimens of the magnificence of such works in the age we are speaking of: the loftiness of the work, the number of arches and pinnacles, the lightness of the spires, the richness and profusion of foliage and crockets, the solemn repose of the principal statue, representing the deceased in his last prayer for mercy to the Throne of Grace, the delicacy of thought in the group of angels bearing the soul, and the tender sentiment of concern variously expressed in the relations, ranged in order round the basement, forcibly arrest the attention, and carry the thoughts not only to other ages, but other states of existence.

'It is a gratification to know that the principal sculptors and painters, employed by Edward III. in his Collegiate Church, (St. Stephen's,) now the House of Commons, were Englishmen. In Mr. J. T. Smith's "History of Westminster Palace," we have many of those artists' names.

'Besides several other works in the reign of Henry VI., three deserve to be particularly mentioned.

'Two statues, King Henry on one side, and Archbishop Chicheley on the other, with a basso-relievo of the Resurrection between them, over the door of All Souls' College, in the High-street, Oxford.

'The king's statue has great purity of character, with a peculiar delicacy and grace in the hands, both of which hold the sceptre. The basso-relievo has been carefully defaced, but seems to have possessed merit.

'The second of these works is an arch, in Westminster Abbey, which passes from the back of Henry V.'s tomb over the steps of Henry VII.'s chapel. This arch is adorned with upwards of fifty statues; the centre group, on the north face, represents the coronation of Henry V., the lines of figures on each side, his nobles attending the ceremony. On the south face of the arch, the central object is the king on horseback, armed cap-à-piè, riding full speed, attended by the companions of his expedition. The sculpture is bold and characteristic, the equestrian group is furious and warlike, the standing figures have a natural sentiment in their actions, and simple grandeur in their draperies, such as we admire in the paintings of Raphael or Massaccio.

'The third of these works is the monument of Richard Beauchamp, Earl of Warwick, in St. Mary's

* 'Michael, the sculptor; Master Walter, John of Sonnington, John of Carlisle, Roger of Winchester, &c., painters.'

Church, Warwick: a gilt bronze figure of the Earl in the act of prayer, lies on a richly ornamented marble pedestal, round which are several beautiful small gilt bronze statues, standing in niches supporting canopies over them. The figures are so natural and graceful, the architecture so rich and delicate, that they are excelled by nothing done in Italy of the same kind at this time, although Donatello and Ghiberti were living when this tomb was executed, in the year 1439.

'But the building, of all others most intended for a receptacle and display of sculpture, which former ages have left in England for our admiration, is the Lady Chapel of Westminster Abbey, built by Henry VII. to receive his tomb. It has been said the number of statues, within and without this chapel, amounted to three thousand!—perhaps many of these have been destroyed, and in that number every half figure, or animal, may have been reckoned; but certainly, even at this day, the number is very great, and it is another marvellous example of the astonishing estimation and employment of sculpture in this kingdom before the Reformation. Many interesting particulars concerning this chapel and tomb, from original documents, are given in Britton's "Architectural Antiquities;" from which, and "The Life of Torrigiano," by Vasari, we may conclude that artist was employed on the tomb only, and had no concern with the building or the statues with which it is embellished. The structure appears to have been finished, or nearly so, before Torrigiano began the tomb; and there is reason to think that he did not stay in this country more than six years, which time would be nearly, if not quite, taken up in the execution of the tomb and some other statues about it, now destroyed, together with the rich pedestal and enclosure. The architecture of the tomb has a mixture of Roman arches and decoration, very different from the arches of the chapel, which are all pointed; the figures of the tomb have a better proportion and drawing, in the naked, than those of the chapel; but the figures of the chapel are very superior in natural simplicity and grandeur of character and drapery.

'From these differences in style, from the indentures with Torrigiano relating to the tomb only, and not to the chapel, and from the names of several English artists, painters, sculptors, founders, and masons, being mentioned in the documents, who were not concerned in Torrigiano's engagement, we may presume the chapel and its sculptures were native productions.

'After the observations on this building, we must take a long farewell of such noble and magnificent efforts of art, in raising which the intention of our ancestors was to add a solemnity to religious worship, to impress on the mind those virtues which adorn and exalt humanity.

'The greater number of these structures are already gone!—the remaining few are daily crumbling into ruins!—and with what are their places to be supplied?

'The reign of Henry VIII., and those immediately succeeding him, were employed in settling disputes of faith by public executions; as either of the contending religious parties prevailed, this mutual and undistinguishing spirit of persecution extended to the equal destruction of man and his ingenious labours.—Pp. 11—25.

The Monoclastic fury which raged during the reigns of Henry VIII. and his successors completed the extinction of the art in this country; nor are we sure that it can yet be pronounced to have recovered completely from its debasement.

LOUIS XVIII., HIS COURT AND REIGN.

Memoirs of a Woman of Quality on Louis XVIII., his Court and Reign. 2 vols. 8vo. Paris, 1829.

WHO is this 'woman of quality?' This C—, Comtesse Du —? No matter! We will leave her in the incog. in which we find her, only premising that in Paris she is called 'Du Cayla.' Our readers will be satisfied to know that Madame Du — is a very witty woman, who tells a story *à merveille*, gives a charm to the pettiest details, handles satire and pleasantries with *bon ton*, good taste, and perfect grace, and particularly excels in portrait-painting. Her practised pencil never falters; and the original is frequently restored by a single touch. In short, it would have been matter of eternal regret, if with so much tact and talent, and endowed with so happy a memory, Madame Du —, after having passed the best years of her life in the first society, surrounded with adorers, admitted to the intimacy

of the old King, amid the constant whirl of titled intriguers, politicians, sycophants of every degree, ministers, statesmen, and all the glittering throng that waits on power, had not yielded also to the whim or vanity of writing her memoirs; for, placed as she was better than every body else for seeing and hearing well, she must have seen and heard much. Arrived at that age when a woman must withdraw to the card-table, and be content to see young rivals inheriting the homage which is only lavished upon beauty in its morning splendour and spring-tide freshness, she turned over the contents of her memory, and determined to fix in memoirs the traces of a fading past. She resolved to tell all, suppressing no part of truth; for it was history which she intended to write. At the same time, she promised herself to reserve a moiety of her revelations for her confessor,—the frankness which she had decided on not being that of a writer who conceives scandal necessary to interest the public.

We pass over Madame Du —'s rapid sketches relating to her birth, the devotion of her father to Louis XVIII., the States-General, the departure of the Princes, and the emigration. All these details, though presented in a taking style and possessing interest, have nothing which excites curiosity. But, the few pages which comprise them turned over, the narrative of the author transports us into the midst of the multiplied vicissitudes and singular occurrences that mark the fourteen years which have transpired since the restoration. Then, also, anecdotes, portraits, and witty remarks come thick upon us. The book is the beau idéal of modern fashionable history,—without plan or division, without any of those profound investigations, or learned, energetic, and luminous deductions, which characterise the author who has studied the epochs which he describes, and the annals of the people whose deeds and institutions he rehearses,—who weighs events, determines causes, and indicates their effects. It is, in short, a series of stories, a running fire of epigrams. We read without being lectured: attention is excited, and curiosity satisfied. The locution of the memory and the combination of instruction with amusement are the qualities by which personal memoirs seek and obtain popularity; and these ends are no where more fully realised than in the 'Memoirs of a Woman of Quality.'

Returning to France in 1800, our authoress has occasion to see the wife of the First Consul; and the following is the portrait she sketches of that charming woman:

'Josephine,—for so I love to call the wife of Buonaparte,—Josephine was adored by all about her. And who could have refused his homage? She was so gracious, so noble, so beautiful! Yet all this was what one admired least in seeing her. None ever had a character more amiable, manners more seductive, a gentleness more angelic. Her innocent taste for botany and her enlightened admiration of the fine arts are well known; and her heart was worthy of her mind. There was in her as it were the instinct of benevolence which no obstacle could restrain: no misfortune, however great, could have taken her by surprise; her ingenious goodness always suggested means of consolation.'

Of M. Benjamin Constant, the satellite of Madame de Stael, she says:

'He enlivened the conversation by his sprightly sallies, his ingenious repartees; but when he attempted to define, he was quite another man: his fine imagination, lost in space, could fix itself on nothing.'

It was of him that Madame de Stael used to say: 'The pretty windmill! No sails could be more brightly gilt; but it will never stop.'

She describes the Duchess d'Abrantes, now gay, now sad, according as her poor husband affected the hero or the fool; and M. de Metternich, as managing the affairs of Austria while paying his court to the noble dames of Paris, deeply in love with every woman whose husband was likely to know any state secrets, mixing policy with his glances, and diplomacy with his sighs. But vainly did he think with his German gallantry to outwit

Napoleon, who knew him by heart. In vain, also, did he pay homage to our fair author. She ensured his cajoleries only that she might judge how they did these things in Austria; and all that the German Envoy gained, was the mortification of perceiving that she was making fun of him. Of M. Royer Collard she says,

“Whom Louis XVIII. surnamed the Royalist *par excellence*, a praiseworthy man, endowed with an intellect deeper than it is extensive, who embraces questions with a singular vigour, and leaves on all matters which he treats the luminous traces of his passage.”

Of M. De Talleyrand, she says:

“Born for intrigue, he did not fail of his vocation: he intrigued for and against every Government, from the Constituent Assembly, to the Restoration; for them, on their first establishment, and while they held out any prospect of reward; against them, when they began to totter, and there was nothing to be gained from the presumed successor. He was the witty and most amiable egotist in the world.”

M. De Blacas, the lowest in mediocrity, whether in point of talent or diplomatic skill, Madame Du — puts in the same rank with M. De Polignac; though “probably,” she adds, “it will be thought that in so doing I disparage the Prince.” Our authoress next gives a few sketches of the noble nullities who flounced about at the Court of Hartwell, whither she went as an envoy of the Royalist Committee, whence she returns to Paris, rejoins her employers, sees the diadem gradually withdrawn from the royal brow; eulogises, *en passant*, certain Members of the Committee of Royal Safety; says a word or two of several Members of the Senate, as Lanjuinais, General d’Embarre, Barthélémy, who guided the Senate into a path of independence in which they were surprised to walk,—and M. De Fontaines, “the Mæcenas of the imperial literature, who had more skill than talent, more cunning than capacity, (*plus de savoir-faire que de savoir*), who praised with ridiculous extravagance, and whose memory has now scarcely any existence.”

This brings us to the entry of Louis XVIII. into France; and, from that day, Madame Du — dates the great favour she enjoyed at Court till the monarch’s death. She presented herself before his Majesty at St. Omers. The impressions she had made at Hartwell were not effaced. Louis received her very kindly, and, when she took leave, commanded her to come and see him, not in ceremonious court attire, but dressed with all simplicity. Then he ordered his chief valet-de-chambre to introduce her, when she should present herself, by the private passage. She took good care not to forget such an invitation. She was now the confidante of the King, and from that moment was equally surrounded by enviers and courtiers. Every one interpreted as he chose the species of familiarity and intimacy which seemed to exist between this lady and the sovereign; with reference to some of which interpretations, she observes:

“The silly rumours of the Court buzzed in my ears without giving me the slightest uneasiness. Those who were envious of my distinction, indeed, amused with their quibblets the simpletons of Paris; but they had no power to harm me. One evening as I entered a ball-room, I heard a little contemptible lawyer say to his neighbour, while ogling me with a coxcombical air, “Faith, the King’s snuff-box is pretty!” This intended witticism is still a riddle to myself; and I wager that those who laughed at it had no better knowledge of its meaning.”

The restoration was the signal for intrigue. In vain did MM. De Talleyrand, Chateaubriand, Montesquieu, and Vitrolles, endeavour to captivate the good-will of the monarch. Louis, who was subtle himself, had no affection for the craftiness of Talleyrand. “If I put him at the head of affairs,” said he, “he would make Europe believe that I could not do without him. Were Chateaubriand minister, it would be said that he corrected my speeches.” Scarce had the King asked M. de Vitrolles a single question or two on the affairs of France, when he saw the total

incapacity of the poor man and abandoned him at once.

“You know,” (said Louis to Madame Du — in one of their private conversations,) “you know the Duke de Raguse?” “Yes, Sir.” “What do you think of him?” “So long as his fidelity is compulsory, your Majesty may count on him.” “And Marshal Oudinot?” “He is the very personification of honour; but I think his arm is better than his head.” “True: as for the Duke d’Albufera, they say that his capacity for civil administration is equal to his military science. Ney is a hero in the field; but he has no head: all his merit lies in his sword.”

Our authoress proceeds with the gallery of portraits. She represents M. Dombay, who had just been appointed Great Chancellor, as a third-rate man, who had forgotten jurisprudence during the Revolution, without learning politics; General Dupont, as having no other title to be Minister of War, than the capitulation of Baylen and the imprisonment which he had the good luck to suffer, but otherwise completely incapable; M. Dandré, Minister of Police, as a man who would have been dreadfully embarrassed by being asked any thing about the business of his department.

The return of Buonaparte from Elba, the departure of the King for England, the Government of the hundred days, the Battle of Waterloo, its results, the abdication, the occupation of France by foreigners,—in fine, every event that has drawn attention and agitated France up to the present time, is treated by our authoress with so much energy and truth, that one cannot read her memoirs without feelings of the liveliest interest, particularly that interest of curiosity so powerful with the public, because, while she recounts the history of a period in which we have lived, she discloses to us facts of which we are ignorant, and which she alone was in a capacity to know, seeing that she was in some sort more than Prime Minister.

How many intrigues and intriguers, who were buried in forgetfulness, do the witty and epigrammatic recitals of Madame Du — disinter and produce to that broad day which they had so much reason to fear! How many events which had an appearance of importance does she render pitiful, and their causes miserable! How many living jackdaws does she strip of their borrowed plumes, whom it would ill become to be angry, because, faithful to her principles and cleverly disguising the severest animadversion under the utmost urbanity of expression, she has never forgotten that a history is not a pamphlet! In one word, these memoirs compose a long gallery, where many persons will undoubtedly be greatly shocked to find themselves. No pains have been taken to lay hold of pretexts for exposing anyone to public scorn; but whoever has borne a part, and an active part, in the events which history records, must, *volens volens*, submit himself to her burin.

Among the malcontents will be found the Cardinal De Latil, and the Viscomte De Bonald; and we will present our readers with the opinion which our authoress expresses of the author of ‘La Legislation Primitive,’ and the Archbishop of Rheims. It is one which we neither vindicate nor dispute; but which we simply give as we find it recorded. There are, besides, a multitude of anecdotes and portraits related in the same lively vein, and traced with the same vivid and discriminating pencil, which strongly tempt us to lengthen our quotations, but for which we must refer our readers to the book itself.

‘Monsieur has brought back with him a man who certainly possesses some very estimable private qualities; but who has no call to expose himself in the arena of politics, except from his own inordinate ambition. This man, who is a priest, would fain be something more; but the same stuff that makes a Cardinal, will not always compose a diplomatist; and merely to wear the hat of Richelieu will convert no man into a great minister. His Eminence, my Lord De Latil knows nothing of the progress of affairs, and has no

comprehension of the actual situation of France. He obstinately persists in viewing it as it was in the sixteenth century, and not as what time has made it. However, notwithstanding his short-sightedness, he complains that power is wanting to him; and I, who know the man, believe, that, if unhappily he should attain it, he would be found wanting to power.

“While speaking of the ambitious, I must not forget the Viscomte De Bonald. Just as he is a philosopher without philosophy, is he a gentleman without birth. His grandfather figured among the petty burghers of a petty town. His descendant was born at the commencement of the Revolution; and I know not how he has the impudence to complain when he owes to that event 140,000 livres de rente. It shows a great deal either of disinterestedness or of ingratitude, which you like. It is true he has some reason not to be content; he came at his peerage by the way of the censorship; and I know many honest persons who would not reach the same eminence by the same path. M. De Bonald, very easily accommodated himself to the imperial régime. Afterwards, under the Restoration, he thought he should be made a minister. Deceived in his expectation, he joined the Opposition. Meantime a handsome pension of 20,000 francs had been given him out of the funds of the police. Here was ingratitude for once in a way! Louis XVIII. could not endure either his person or his works. He called the drum M. Bonald, to intimate that it sounded or reasoned hollow, (*resonnait ou raisonnait à creux*.) One day the Duke De La Chartre was complaining to the shrewd monarch of a violent toothache, adding that he had in vain tried all the opiates he could think of to procure sleep. “La Chartre,” replied Louis, “read ‘La Legislation Primitive.’”

We cannot resist the temptation to quote another fragment of these curious revelations. It is taken from the third volume, (which has just made its appearance,) and relates to the arrival of the Princess of Wales in Paris. This extract will show how completely Madame Du — was in the confidence of her royal lover:

“The arrival of the Princess of Wales in Paris was not pleasing to Louis XVIII., whom she placed in an awkward situation. He would have treated her according to her rank, had he not been prevented by the Duke of Wellington, who, in the name of the Prince Regent, begged his Majesty to close his eyes to the presence of a woman who had in her own person disgraced all royal majesties. The Duchess of Wellington, but newly arrived, exclaimed in all places against the Princess of Wales, in the name of British chastity.

“Said Louis to me, “You might do me a great service.” “I would do your Majesty a thousand. But what is it you require?” “That you see the Princess of Wales. Go to her, and tell her, as if by indiscretion, what is passing here. Inform her how they are intriguing against her; and, if it be necessary, accuse me of weakness: speak ill of me to her.” “Take care, Sir,” replied I, laughing, “lest I literally observe your Majesty’s instructions.” “What are they?” “To speak ill of you.” “I trust in your malice to say enough, and in your goodness not to say too much.”

“As soon as I arrived at home, I wrote to the Princess of Wales, requesting her to grant me the favour of an audience. I was aware that I was known to her through my brother, who had frequently seen her in England, and had presented himself to her since her arrival in Paris. Apropos of my brother, I find that, with my usual stupidity, I have passed over the restoration without any mention of him. He deserves, however, a separate article; and I will give him one when I have done with the Princess of Wales. She answered my letter with a good deal of grace and feeling. She represented herself as an obscure voyager, beaten by the tempest, who came to seek an asylum in Paris. She complained of being abandoned by those very persons who in other days had found near her person in England an honourable refuge and royal consolations. She concluded by granting me the audience requested.

“I was punctual to the appointment. Her Royal Highness began by speaking of my brother. “He is a very handsome youth,” said she; “he turned more heads than one in London; but his conduct there was always excellent; for, excepting Miss W—— and Lady C——, he neither dishonoured nor compromised any woman.” “Ah! Madam,” said I, “were not two sufficient?” “Pooh!” replied she; “that cannot count. The married lady had already her reputation half made, and was willing enough to com-

plete it. As for the young girl, her peccadillo has not prevented her from making a very good match. But, if you please, we will change the conversation, and talk about France. Well! she is now restored. You are all glad to receive back your ancient family?" I replied, we were. "It may be," added the Princess, "the Bourbons will make you happy; but they will never procure you much pleasure. They are honest persons, but not very amusing. Madame is so virtuous, that it makes her sad. The Duke d'Angoulême is a sage worthy of the Grand Dauphin. Monsieur has nothing of youth but its agreeable reminiscences. Your King is too much of an invalid to think of dancing, or of making others dance; he is only good for conversation."

"You forget," said I, when I had recovered my embarrassment, "you forget the Duke de Berri." "Ah! yes; he is a man for the ladies, with little of grace to be sure, but with entire devotion. However, it is not for him alone to represent his family. Indeed, I am plucked at your Court. Hark ye, Madam; tell the King that I complain of his want of courtesy, and that he does not behave well to me; I may be at odds with my husband, without ceasing to be of the blood of Brunswick, and Regent of England."

"I availed myself of this opening to enter into explanation with her Royal Highness. I pointed out to her the awkward position of the King, and the regard he owed to the Prince of Wales, and adjusted the matter as well as I could. "This is the way with them all," replied the Princess; "they sacrifice all friendship and gratitude to a vain piece of state convenience. There is no heart but in the middle ranks. Had I to marry again, I would not give my hand to a King." Just then came in the child so notorious in the history of her Royal Highness,—Austin, to whom was attributed an illustrious birth, and whom indeed she treated with a mother's tenderness. He was the most frolicsome child I ever saw in my life, a true devil with the figure of an angel. He did but pop in; but he speedily turned the room upside down. I admired the patience of his protectress. She ordered him to be taken away, and then, smiling, said to me: "I spoil him, but he amuses me." "He is very handsome," I rejoined. "Yes, a charming creature. I have been much calumniated respecting him." I was silent. The Princess understood me, I suppose; for she passed to something else. She asked me if I had seen Buonaparte; and, on my answering that I had, she said, "You are fortunate: I hope to see him soon. He is a great man, and now a-days there are few great men among Kings. My father-in-law and the King of Denmark are both madmen; he of Sweden, an usurper without talent; the Czar of Russia is spreading illumination; the King of Prussia spends his time in lamenting his wife; and the Emperor of Austria in making children and sealing-wax. There is a mad woman in Portugal; a bigot at Madrid—I like but to speak of Napoleon's family. The Princess Borghese is the prettiest and liveliest woman in the family, is she not?" "She is charming," I replied, "and has equal grace and beauty: she is a tall and well-formed nymph." "A nymph,—but quite a vestal?" "Mon Dieu! Madame," replied I, "the world is very wicked: the Princess Pauline had too much merit to want adorers. She may have distinguished some two or three of them: which have been magnified to twenty or thirty. The Princess Elisa loves the arts and fêtes: she cannot manage money. They call her the Semiramis of Tuscany. She has taste and spirit. As for the Queen of Naples, you will see her: she is still pretty."

"Oh I shall see them all. We shall meet at the Carnival at Venice. It is an excellent mode of spending time for reformed Princes!"

"The conversation had lasted an hour in this strain. Though the Princess gave me no hint of it, I understood it was time to take my leave."

THE LONDON REVIEW.

The London Review, No. II. Saunders and Otley. London, 1829.

In the second number of this new periodical, just published, there is a paper which needs little external evidence to distinguish it as the work of Mr. Blanco White; and which is no less characterized by a strong grasp of the subject, (*Spanish poetry and language*), than by clearness and vigour of style and of arrangement in the treatment of it. The reviewer begins by acknowledging the rich volume of sound and melody, which leads enchantment to Castilian poetry, and which harmonises perfectly with the character and cli-

mate of its native soil, especially the south of Spain, where 'a confirmed taste for the drowsy enjoyment of vague sounds, expressing rather a state of being than of thought or even sentiment, prevails,'—a taste of which the general fondness for the guitar is a still more evident effect and indication. 'Wind instruments require more activity than a Spaniard likes as an amusement, or is indeed suitable to the climate. Those instruments, being incapable of yielding more than one sound at a time, require considerable attention and dexterity, in order to give pleasure even to the rudest ear. The guitar has three of its strings ready tuned for a perfect harmony, which the change of one or two fingers may swell and vary with good effect; and the sounds will follow the most unskilful hand, passing the end of the finger up and down across the instrument. In this manner, it either lulls the player, in a manner not unlike distant bells, or makes the most appropriate accompaniment to the national melodies, which have little variety of modulation.'

This passive mode of delight in mere sound has concurred to deprive the Castilian tongue of any higher poetical excellence with two other influences more unalloyed in evil; and all together have sufficed to stunt the whole poetical produce of a language which is naturally as copious as it is sonorous. The unfortunate prejudice which has established circumlocution as a component part of dignity, and the still more unfortunate fastidiousness which has banished from all but humorous or comic effusions, the great body of its primitive words and phrases, have condemned to 'mute inglorious' silence many a noble genius since the truly poetical spirit of Cervantes, and have inflicted the curse of barrenness on a language which is 'in its elements and original structure a most powerful and various instrument of thought.' The former of these evils must have probably originated in the already noted propensity of the national ear to dwell with delight on musical and finely rounded periods. And the latter, our Reviewer ascribes, (we doubt not with justice,) in great measure to a cause which has more or less operated on all the modern European tongues, but those of England and Germany, the want namely of some standard work which should consecrate yet popularise the whole original treasures of the vulgar tongue. 'What Homer did for the Greeks, the translated Bible has done for the English and Germans; it has given them a manly freedom of expression. The most ancient and primitive book could not be translated without employing all the stores of any modern language.'

For the nervelessness, affectation, and dilution of thought which has been engendered by these causes, Mr. Blanco White anticipates no cure amidst the apathy of long-established usage. He forgets, that across the Pyrenees the language of France has been, by a salutary shock, forced back on its sources and first energies, and, by the urgent need of expressing new conditions and feelings, enriched with contributions unknown to the artificial canals and tanks of boudoirs and academies. Even the forced expatriation of so many of those who formed the prime intelligence and ornament of Spain, may not be without its use in opening sources of improvement from acquaintance with the literature and languages of Europe; and we trust that one day their triumphant restoration to her shores, will find a national ear attuned to the awful voice of Liberty.

PHYSIOLOGY.

An Essay on the Connection between the Action of the Heart and Arteries, and the Functions of the Nervous System, and particularly its Influence in exciting the Involuntary act of Respiration. By Joseph Swan. 8vo., pp. 162. Longman and Co. London, 1829.

THE physiological mechanism of respiration has long engaged the attention of both theoretical and experimental inquirers; and, as it is very complicated and difficult, it is a subject which does not appear easily exhaustible, and conse-

quently forms a good field for the exercise of talent. Mr. Swan could not, therefore, have chosen a better subject for experiment; and, so far as he has proceeded, he seems to us to have displayed great accuracy and considerable acuteness; but in a small volume like the present it was impossible for him to do justice to the complicated details comprehended in the whole process of respiration. This does not, indeed, seem to have been so much his design, as to give the original views suggested to himself by experiment and study. Such of our readers as are acquainted with the former productions of Mr. Swan, particularly his 'Dissertation on Morbid Affections of the Nerves,' and his 'Inquiry into the Action of Mercury on the Living Body,' require not to be told that he is an original thinker, an accurate experimenter, and an excellent writer. We would most willingly exemplify all these characteristics by extracts from the work before us; but our space will not permit us to enlarge upon so abstruse a subject. In the preface, he tells us, with praiseworthy modesty, that he has stated his own opinions with very considerable hesitation; but, as the great secrets of nature are seldom to be revealed except by the succeeding labours of different individuals, so he has contributed what appeared to him sufficiently important for extending our knowledge on the interesting subject of respiration, as well as some others connected with it. The peculiar views adopted by Mr. Swan may be gathered from the following brief extract:

'Artificial respiration shows that the action of the heart is in a great degree independent of the nervous system, and that the muscles of respiration are of a very different nature from the muscular substance of the heart, and are irritable in a different manner. The powers of the nerves are so depressed by some poisons, that although they be agitated by the heart and blood-vessels, they cannot afford the necessary stimulus to the parts they supply; but when the influence of the poison has been dissipated, their functions may sometimes be restored, provided artificial respiration be kept up so as to maintain sufficiently the action of the heart.'—P. 6.

'Some may believe that respiration is a peculiar power implanted in the body, and therefore not to be accounted for. It is a combination of mechanical and chemical operations, performed by a complexity of organs for effecting such changes in the blood as are necessary for the preservation of life, and producing other actions, which are peculiarly conducive to the comfort and convenience of man; and it is therefore reasonable to inquire not only how these individually act, but how they afford that reciprocal assistance, which is determined to such important ends.

'The ordinary act of respiration is involuntary; but there is a power superadded which is voluntary.'—P. 98.

'It appears that the motion of the heart and blood-vessels sets in action, and produces the regularity of respiration, and that it is effected not only by the association of the nerves, but principally by the mechanical excitement of the nerves which pass over those parts in motion. By the communications of the grand sympathetic with the phrenic, and also with the dorsal nerves, an association is produced between them, and the motions of the heart and the subclavian arteries stimulate mechanically the phrenic nerves, and the branches of the grand sympathetic connected with them, and the intercostal nerves, at the same instant. The communications of the grand sympathetic with the *par vagum* may produce an association between these nerves and the lungs; and some degree of the same impulse may be also given to them by the lungs themselves.'—P. 110.

The experiments and cases by which Mr. Swan supports these views are ingenious, and well worth the perusal of all who are interested in physiological investigations.

LITERATURE OF THE SWAN RIVER.

REPORT OF THE COMMITTEE OF THE HOUSE OF COMMONS, APPOINTED TO CONSIDER THE EXPEDIENCY OF ESTABLISHING A SWAN RIVER LITERATURE.

[Not yet presented, but kindly communicated to 'The Athenæum,' by the Chairman, Mr. Alderman Wood.]

In pursuance of the directions which they have received from your Honourable House, the Committee for considering the most practicable means of effecting a settlement on the banks of the Swan River, have occupied themselves during the present Session in considering the expediency of establishing a literature in this infant colony. The result of their investigations they have now the honour to lay before the House.

The valuable evidence of Peter M'Culloch, Esq., contained in page 4 of the Appendix, convinced the Committee of the following truths: That the principal circumstance which checks the free growth of a literature in an old country, is the fictitious value attached to works which have been long in the market, though those works cannot have been benefited by any of the improvements which have recently been introduced into the manufacture—that it is obviously advantageous, when a country is rapidly advancing, that it should have a literature which keeps pace with its advancement, and, consequently, which changes its character every few years—that this never, however, will happen, so long as an old literature exists, most men habitually preferring that to which they are accustomed—that, consequently, it would be desirable to devise means for preventing, if possible, the establishment of an old literature, for which attempt a colony obviously offers the greatest facilities—that the chief cause of works continuing to live after it is for the interest of the public that they should die and make way for new ones, is the quantity of time and thought that has been expended on their production—that, consequently, the less of time and thought that is spent upon their production, the more chance is there of their answering the purpose intended; and, to express the whole in the form of a simple proposition,—THAT IN LITERATURE THE FINENESS OF THE ARTICLE, INSTEAD OF VARYING DIRECTLY AS HAS BEEN SUPPOSED, VARIES INVERSELY AS THE INFERIORITY OF THE MATERIAL EMPLOYED IN ITS PRODUCTION.

After listening to this beautiful application of the principles of science to a subject which had not previously been brought within their sphere, the Committee proceeded to their next duty. It was to ascertain, firstly, which branches of literature could be most easily accommodated to Mr. M'Culloch's principles, and which, consequently, it was most desirable to introduce into the new settlement; and, secondly, to ascertain what class of settlers would be most likely to undertake this office.

Keeping these two objects in sight, the Committee proceeded to examine several gentlemen whose acquaintance and personal connection with literature entitled their opinions to weight and deference. They would particularly call the attention of the House to the evidence of Mr. Jeffry, [p. 9—16 of the Appendix,] who asserted as his conclusion from the experience of thirty years, that the value of a review depended almost entirely upon the exclusion of all study and speculation from it. The Committee cannot resist making a short extract.

EXAMINATION OF MR. JEFFRY.

'You mentioned that the practice of reviewing had been very much improved of late years. Have these improvements tended to diminish the quantity of labour employed in the production?

'Most materially, though persons not in the secret are constantly proclaiming the reverse, to our infinite amusement. They fancy that the increase of subjects and of the length of the articles, is a decisive evidence on their side, whereas we

know that the increase of subjects has been accompanied by a much more than proportionable increase of common forms, and that the length of the articles is an admirable security that they are never read.

'You talk of common forms, what are they?

'Forms for beginning articles, such as, 1st. The Solemn; as for instance, "No one who contemplates the vast events which have been altering the condition of the old and new continents during the last twenty-five years, with the eye of a statesman and the spirit of a philosopher, can," &c. 2. The Abrupt; viz., "This is a mighty pleasant book." 3. The Common-place; as, "The nineteenth century is, unquestionably, an age of invention." 4. The Facetious; as, "A friend of ours was wandering one day near his seat in the West of England," &c. 5. The Polite; as, "We think the author of this book a very good-natured, easy, gentleman-like man." 6. The Impertinent; as, "This won't do;" with about twenty others, which it would tire the Committee to mention. Then, also, there are forms of conclusion. 1. The Eloquent, called more commonly in "The Edinburgh Review," "the Holy Alliance paragraph," chiefly used after very dull articles. 2. The Tremendous, generally a quotation from Fox or Grattan. 3. The Propitiatory, wherein an author is called a man of talents, and an honest man, at the end of an article written to prove that no one could have written his book who was not a fool and a knave. 4. The Saucy, the invention of which belongs to my lively young friend who writes about Macchiavelli and the Catholic Question. 5.—But I will not trouble the Committee any further.

'How do you furnish the middles of articles?

'The greater part from the public accounts and reports of the House of Commons, a good many from the reports of the Society for the Diffusion of Useful Knowledge, a few with quotations, and a great part of the remainder from old numbers of the Review.

'Do you exclude original articles altogether, then?

'Not entirely; there are one or two boys on the establishment who are proud of their skill in turning sentences, and therefore do not make use of those that are for each case made and provided. But they waste their time egregiously.

'You think that a Quarterly Swan-River Review might be published, which would not consume any portion of the settlers' thoughts which will be needed for other purposes?

'If the editor understands his business, certainly.'

The next person whom the Committee examined was Mr. Robert Montgomery, whose answers were throughout clear, straightforward, and satisfactory. (See Appendix, pp. 50—54.) He was decisive as to the possibility of raising a poem on Noah's Ark in the course of the voyage, of its going through several editions, and of its not being remembered at the end of the twelfth month.

The Committee must also particularly request the House to peruse the evidence of Mr. A. K. Newman, (pp. 216—219, of the Appendix,) who offered to contract, upon terms which the Committee must confess were exceedingly reasonable, to settle four hundred novelists in the colony before next August. For many reasons, the Committee were disposed to urge the adoption of the proposal, especially as Mr. Newman deposed that he was able to show by tables in his possession, that the writers for the Minerva Press contributed more to increase the population of England than any other body, country curates alone excepted. But they were deterred from coming to a final resolution, by Mr. Newman intimating that he could not answer for the continuance of these meritorious individuals in health, unless the House would undertake to provide them with an atmosphere like that to which they have been accustomed in Pater-noster-row and Drury-lane.

The next witness was Mr. Mill, the author of several works on history, philosophy, and political economy. His evidence is too important to be abridged. The Committee give it in his own words.

MR. MILL EXAMINED.

'You are a political economist, Mr. Mill? I am.

'Do you agree in a principle which has been just enunciated to the Committee by one of your class, that books are better in proportion to the smallness of the time and thought spent in raising them?

'Every objection affects an argument either to a material or to an immaterial extent. To know whether my objection to this proposition would affect the conclusion founded upon it in the one way or the other, I must know what the conclusion is.

'You do object to the proposition, then, to a certain extent?

'So far as this, that I believe works have been written upon which a great portion of time and thought has been bestowed, which, nevertheless, possess a high value.

'Could you favour us with an instance?

'A recent work published by Messrs. Longman, Hurst, and Co., and entitled "An Analysis of the Phenomena of the Human Mind."

'Do you think it is generally desirable that books of such a description should be written?

'The necessity existed, but it has ceased. The book is written. Henceforth no work on the human mind will not cost its producer more time and trouble than is necessary merely to write down his ideas.

'Supposing, then, it were proposed to found a school of Metaphysics on the banks of the Swan River, do you imagine this object might be accomplished without departing from the principle of Mr. M'Culloch's proposition?

'Certainly; I could point out to the Committee ten young gentlemen of my own acquaintance, who, by means of the formulae provided in the book I have mentioned, would be able to establish the school and to write all the necessary treatises for it without spending a single thought.

'Without spending a single thought?

'I adhere to my words.

'What security would there be for their adhering to this economical principle?

'The security of an axiom which is as undoubted as any thing can be in moral science, as it has been generalised from a series of extensive observations, that the quantity of subject-matter consumed by any individual may equal or fall short of, but cannot exceed, the quantity of the same subject-matter possessed by that individual.'

The force of this clear, decisive and satisfactory evidence, was not shaken in the minds of the Committee by the counter testimony of a gentleman from Highgate, who entertained them for the space of six hours, with an account of the course and study of reflection necessary to the preparation of a work on the 'Elements of Discourse,' which, he observed, was intended as a metaphysical primer or horn-book, from which a student possessed of a hard head, a willing heart, a clear conscience, a good memory, and strong book-mindedness, might, by the application of all his faculties, acquire a knowledge of the alphabet of the science. The Committee think it would be decidedly inexpedient to send out this gentleman or any of his disciples to the new settlement. As much of his evidence as could be reported by the Clerk of the Committee will be found in the Appendix. [Pp. 96—204.]

Abundantly confirmatory of the principal facts deposed to by Mr. Mill, was the testimony of the 'Author of the Disowned.' The following extract from the evidence of this important witness, will set the question in a very clear light.

EXAMINATION OF THE 'AUTHOR OF THE DISOWNED.'

'In the course of the last winter, Sir, you published a metaphysical novel?

'I did—a metaphysico-fashionable novel.

• 'The metaphysics of which gave, as the Committee has been informed, universal satisfaction.

'If universal means merely of or belonging to the visible universe, I may say that it gave more than universal pleasure; for not only did it perfectly satisfy myself and the Lady Patronesses, but also a large body of bipeds, existing, for the most part, "*extra flammantis mœnia mundi*," on the north side of Oxford-street, and in the dark caverns of Westminster; and there called, as I learn from a dweller in those solitudes, who has described them particularly in the last "Edinburgh Review," Utilitarians or Benthamites.

'You mentioned, Sir, in a former part of your examination, that you were occupied nearly two months in the composition of the four volumes?

'I believe the MSS. did lie upon my table for nearly that time.

'Can you inform the Committee how large a portion of that two months was spent in preparing the metaphysics of the work?

'The press was delayed nearly a week by the dilatoriness of one of the parties.

'To what parties do you refer?

'A document which I have in my pocket will explain. I must beg leave to mention, that it was given to me this morning by my publisher, and that, being somewhat pressed for time, I unconsciously thrust it into my waistcoat. It is an offence which I never was guilty of before, and I trust the Committee will not betray me. The document is as follows:

"DEAR SIR,—You remember that in our original negotiation respecting 'The Disowned,' it was agreed that the charge for procuring the metaphysics, which I undertook, should not be included in the price of the copyright. I now beg leave to forward for your perusal the inclosed bill, which I have received from the different persons who took part in providing them.—I am, Sir, &c. &c.

"H. COLBURN.

"BILL.

"To selecting metaphysical opinions from 'The Westminster Review,' at the rate of 4s. for every 100,		£2	1	6
"To finding authorities for the same, at the rate of 2s. for the name of every ancient philosopher—1s. for all philosophers previous to Hobbes—and 6d. for all since,		3	2	1
"To washing, dressing, and making gentlemanly, the opinions taken from 'The Westminster Review,' as per former item. (This, being a delicate business, was undertaken by my own shopman.)		21	0	0
"To fitting the same to the character of Mr. Mordaunt,		4	5	0
		£30	8	7

'This, I understand, is much above the ordinary rate; and I learn from a person at the Bar, with whom I have the misfortune to be acquainted, that, if the bill were taxed in the Court of Chancery, it would be reduced to one-third of its present amount.

The portions of the evidence to which the Committee has referred, are sufficient, they submit, to prove the feasibility of the scheme for introducing literature into the new settlement. By comparing them with the other parts of the evidence contained in the appendix, it will be seen also, that some kinds of literature possess a decided superiority over others in the facility of their production, yet that there is none which, under proper management, may not be suitable for the present purpose. Wherever proper modes of culture have been adopted, and a skilful use has been made of the powers of machinery, every literary soil, however intractable at first, has at length been rendered productive, at a small expense of time and labour. The Committee, therefore, does not des-

pair of seeing, in a few years, a plentiful crop of English plants, of every genus, adorning the banks of the Swan River; and, by their periodical decline, making room for fresh flowers to spring out of a soil, upon which the animal matter they leave behind them has operated as a rich and fertilising manure. All things, however, must proceed gradually; and every great practical scheme should be preceded by one which is merely experimental. The Committee therefore recommend that the House should commence in the course of the next session, by sending out one metaphysician, two religious poets (that race being sickly), a reviewer, and a fashionable novelist. As it is desirable that all obstructions should be removed which can impede the suggested, or any future, emigration of persons of this description, the Committee would further recommend the repeal or modification of that clause in the original charter of the colony which provides that no convicts shall be allowed to settle in it.

THE STATUES.

I sought the hall where tranquil stood
The silent marble multitude,
The glorious Gods, the god-like men,
That earth will never see again.

Their brows were full of inward thought,
Their eyes with sightless meaning fraught;
A finer blood than plays in man
Unseen through every member ran.

Beauty and age, the hostile powers
That struggle in this world of our's,
In friendly league for them had made,
A sphere of calm, a splendid shade.

By a deep life within sustained,
They, to themselves sufficing, reigned;
Not more serene, or bright, or still
Angels that sleep on Horeb's hill.

I sought the hall wherein they stood
With hope to tame my fevered blood,
To breathe the cold and stirless air
That filled itself with beauty there.

And who, I said, 'mid brows so clear,
And eyes so pure from throb or tear,
Amid these pale embodied stars,
Would feel the world's convulsive jars?

A sacred awe, a strengthening might,
Sits on each forehead's lineless height;
And those broad eyes will scare away
The thoughts that are not calm as they.

But O! how strongly weakness rules;
How low the loftiest hopes of fools;
How vain to dream those forms could be
Aught but a phantom troop for me!

'Tis not when passion, fret, and care,
Have wrought the spirit to despair,
That Beauty from her skies will come,
To bless the dark, polluted home.

Slave of the wind and cloud! the sun
By other souls than thine is won;
Child of a brief and troubled hour!
Thou canst not grasp the Eternal's power.

I paced the voiceless hall, and gazed
On goodliest shapes like one amazed;
With burning cheek and fainting limb,
My bosom shook, my sight was dim.

I wandered quick from shade to shade,
In steadfast majesty arrayed,
And each, with threats and mocks of shame,
A dread avenging fiend became.

The hueless eye, the placid brow,
With horrid light were all a-glow;
And those high gods to spectres turned,
Started, and shrieked, and scowled, and spurned.

A ghastly throng around me spread,
And echoing yells pursued my tread;
And all that clear unearthly world
To chaos, vast and wild, was hurled.

ROYAL INSTITUTION.

DR. CLARKE excited the interest of a numerous audience, on Friday last, by the relation of his ascent of Mont Blanc. The enterprising traveller, after noticing the different spots on the road from Dijon, at which the mountain is visible, and pointing out the best points of view presented by the neighbourhood of the Valley of Chamouny, (giving the preference to that of the Col de Balme,) proceeded to counsel those of his auditors who might ever feel the desire, and enjoy the opportunity, of engaging in the arduous task, as to the best mode of preparing for the undertaking. He condemned the custom of the guides, of providing themselves with heavy joints of meat, as a practice unsuited for the occasion and cumbersome, and impeding to those who were burdened with the charge. He recommended, in preference, such provisions as are light for carriage, and are compressible within smaller compass. The use of brandy diluted with snow he also objected to as liable to produce or increase the feverish state of the traveller, and recommended as the best beverage, claret and water.

After these preparatory remarks, Dr. Clarke described the different routes by which the summit of the mountain is accessible, pointed out that taken by himself and his party, and detailed the particulars of his journey, and the many difficulties he had to encounter in the course of it. We regret that we cannot follow him;—on paper, for we doubt much whether, even had a favourable opportunity presented itself, the aspect of this 'monarch of mountains' would have inspired us with the ambition to seat ourselves on his diadem. Dr. Clarke speaks of his sensations when on the summit as gratifying—highly gratifying, for the short period they lasted—but as of only a few moments' duration. Such had been the fatigue and exhaustion which had attended the effort, and such the powerful effect of the rarefaction of the air on the human frame, that it was with difficulty he could preserve himself from falling asleep. Dr. Clarke read several passages from a work on the subject, which, if we understood aright, he is preparing for the press. At the hour appointed for the conclusion of the lecture he paused, with the intention of breaking off in his narration, but the unanimous voice of the company invited him to continue.

On Friday next, the last evening meeting of the season, Mr. Faraday will lecture on Optical Glass.

ROYAL ACADEMY EXHIBITION.

(Continued from p. 298.)

How many times since the first Monday in May has the observation been made by the admirers of Mr. Wilkie, that he has not improved by his change of style! To whose lot has it fallen to pass through the Great Room without overhearing more than one remark to this effect? It may be inferred, indeed, that the opinion is almost a general one; yet we would not that the conclusion be yielded to without inquiring, at least, from what premises it is drawn. It will be found, perhaps, that the notion of deterioration rests on a comparison made from memory merely, of former works with those now exhibiting. The earlier paintings of Wilkie have certainly left a strong impression on the mind: the sentiment and truth which distinguish his domestic scenes were qualities rare in English works of art, when his productions first began to attract public attention. From these qualities his pictures derived a charm which affected the heart to the very core, and which dwelt on it long after the beholder had ceased to regard them; any weakness or deficiency with which they might have been charged, was outshone by the gratification their merits afforded, or became quite obliterated in retrospection. But it may be doubted whether the memory in this case is an impartial arbiter, and whether the very persons who pronounce in favour

of the older paintings of Mr. Wilkie from mere recollection, would not hold a different language, were they to make the actual comparison. 'The Blind Fiddler,' for instance, now in the National Gallery, is not certainly one of the least esteemed productions of the pencil which has since been employed in representing the 'Washing of the Pilgrims' Feet,' and 'The Spanish Posada;' yet, admitting all the merits, the feeling, the fidelity to nature, the playfulness, the beautiful grouping, of the first-named painting, it must be confessed also, that it has a degree of littleness and crampedness which bespeak the days when the steps of art were yet timid: it wants that breadth of effect which proceeds from a free and bold pencil, and shows the master conscious of his power; nor does it display that depth of tone and general harmony which render the Spanish and Italian subjects of Mr. Wilkie, regarded with a view to the colouring only, such delightful paintings. It may be, however, that English amateurs are not prepared to take an interest in the foreign subjects and characters which are now brought before them; but surely this is not the fault of the painter, nor can it be received as a legitimate objection against his change of style. It certainly affords no proof of any present inferiority in the most recent productions of his pencil. On the contrary, the comparison of 'The Blind Fiddler' with any of the eight pictures now in the Exhibition, we doubt not, will furnish satisfactory evidence, to those who will take the trouble of making it, of a decided progress and improvement in Mr. Wilkie, the result of his travels. We trust it will not be long ere we are favoured with an instance of the application of the new fund of skill and experience acquired by this esteemed artist to some subject of British interest. But to resume our general notice of the contents of the Exhibition, which want of space obliged us to suspend in our last Number.

One of the best pictures, we will not merely say in the 'School of Painting,' but in the whole Exhibition, is the 'Landscape after a Shower,' No. 269, F. R. Lee. The charm of truth and nature which reigns throughout this picture is delightful; the effects are powerful without being hard, and are wrought with great judgment, ease, and spirit. The water is truly transparent; the broad leaves of the water-lily appear floating on its surface; the picturesque raggedness and bareness of the bright beech-tree, while it adds to the effect of the deep shade below and to the more sombre character and luxuriant foliage of the oaks in the corner of the picture, affords a pleasing variety. The colouring is powerful, rich, and extremely harmonious.

We alluded in our last notice of the Exhibition to the portraits by Mr. Simpson. There are four of them in this room all equally clever and conspicuous for the freedom with which they are painted, and for their character and expression. They are 'Portrait of Mrs. Flight,' No. 284; 'Portrait of Mrs. Blood,' No. 300; 'Portrait of Mr. Stanfield,' No. 359; and 'Portrait of Mr. Robinson,' No. 373. The likenesses of the two ladies, although persons of very different styles of character, are both most skilfully executed; the first is most remarkable for the boldness of the penciling; the second, for its animated and enchanting expression. The same distinction may be observed in the Portraits of Mr. Stanfield and Mr. Robinson; the former has a very strongly marked character, the latter displays more than usual freedom.

No. 358, 'Portrait of Edward Hurt, Esq.,' J. Jackson, appears a very clever portrait of a not very favourable subject.

We can point to no picture in the Exhibition more exquisite in its kind than 'Puppies' Heads,' No. 311, by Mr. Mulready. They are full of life and nature, and beautifully painted.

Mr. Reinagle's family pictures of ladies and gentlemen, be they brothers and sisters, or hus-

bands, wives, and sisters-in-law,—be they grouped under the porch of a mansion, or stuck up at the harp or piano,—are so stiff and disagreeable,—they represent with such unhappy fidelity, often, perhaps, while they misrepresent their particular subjects, the character of that estimable class of society in this country, who are genteel by will and not by feeling, that it is quite a relief to turn from them to a picture like No. 241, 'An African Scene, with Zebras and Quaggas.'

THE BRITISH INSTITUTION.

THE gallery of this institution opened yesterday, with a collection of ancient masters. The exhibition is a highly interesting one; poor it must be owned in historical works, but rich in first-rate landscapes, and in specimens of the productions of Dutch and Flemish masters. The most attractive pictures, with the exception, perhaps, of an extraordinary work by Both, which occasion will be taken to mention presently, are two beautiful landscapes, by Claude,—the one, 'Landscape, with Europa,' No. 20, the property of his Majesty; the other, 'Landscape,' 59, the property of Mr. Frederic Perkins, and better known as formerly belonging to Mr. Zachary. They are both examples of Claude's best manner: the former is of the quieter and more delicate character, and of a description of composition somewhat rare among the works of the Prince of Landscape Painters; it is delightfully painted, clear and transparent. No. 59 is a more powerful production. For its distance it may rank among the most brilliant and atmospheric ever produced, even by the pencil of Claude. The dark shade of the bank which overhangs the truly pellucid water has a delicious effect of coolness and calm, and greatly aids the brightness of the rest of the composition. The picture seems to be at present labouring under the disadvantage of too high a varnish.

The 'Portraits of Rembrandt,' Nos. 10 and 173; the former the property of Mr. A. Baring, the latter belonging to the Earl of Caledon, both painted by the artist himself, No. 10 when in the decline of life, the other while young, are rendered extremely interesting by these circumstances. The manner of the later painting is firmer but more hard and stiff than the earlier one; both are vigorously painted.

'Landscape with Figures,' Salvator Rosa, the property of Mr. G. J. Cholmondeley, is a small but delightful production of the pencil of that spirited artist.

'View in Italy, with fall of water and figures,' Both, No. 127, the property of Mr. Hamlet, is a real treasure in art. It is a most spirited composition, full of boldness and grandeur, truth and nature. It would make a fine pendant to the brilliant and exquisite production by the same master, belonging to his Majesty, and which, two or three years ago, occupied the place in which Mr. Hamlet's picture is now hung. It would be difficult to pronounce a preference between the two.

Of Canaletti's views in Venice, the number is greater than usual, although none of them are of large dimensions. Several are admirable examples of drawing and precision, and of clearness of effect. The 'View of the Prate della Valle, at Padua, in its former state,' No. 105, the property of Sir Abraham Hume, although the architecture want not any of the characteristics of Canaletti, is not an agreeable picture: the foreground is minute and harsh. The 'View of St. Mark's Place, Venice,' No. 144, the property of the Rev. Sir Samuel Clarke Jervoise, is an instance in which the precision of this admirable artist may be considered as bordering on excess, and attaining a degree of dryness which becomes a defect. The excellence of other works by the same hand in this gallery, will probably induce us to resume the notice of them on an early occasion.

'A Romantic Landscape, with figures representing the Judgment of Paris,' Both and Polemburgh, No. 6, the property of Mr. A. Baring, is a delightful composition. The figures executed by Polemburgh are in a style of painting so different from the landscape, and so much more elaborate, that the contrast is striking, and not altogether agreeable.

In addition to the works we have noticed, it will be sufficient in order to advise our readers of the splendid nature of the collection, to enumerate the names of Titian, Rubens, Vandyke, Caracci, Cuyp, Vandevelde, Ostade, Ruysdael, Jan Steen, Paul Potter, Murillo, Vouverman, and Hobbema, besides a long list of artists scarcely inferior in rank to those already mentioned. We shall return with pleasure to a more detailed review of the collection in our next number.

TURNER'S DRAWINGS.

We have returned to the view of this brilliant and elegant exhibition with fresh gratification, and renewed admiration of Mr. Turner's taste and powers. Safely, indeed, may it be affirmed that excellence in water-colour drawing is exclusively British, when such an exhibition as this exists, which may be referred to in proof of the assertion. Yet it is objected to Mr. Turner that his effects are not natural, that nothing like his colours is to be seen in nature. Without discussing the question in this place, whether the practice of an imitative art requires its follower to copy even as nearly as he can what lies actually before him, we would refer to the two drawings of 'Windsor' and 'Twickenham Meadows;' and putting aside the question whether either of those delightful scenes ever appeared in reality so brilliant as Mr. Turner has represented them, we would inquire if these drawings are not most delightful to the senses; whether the manner in which the scenes are treated by the pencil of Mr. Turner has not even elevated and ennobled them; whether a party bent on pleasure and enjoyment would object to have all around them as splendid, as gay as it here appears; whether our fair companions in a picnic party would not be more disposed to love than to hate the artist who should give an Oriental splendour to the groups they form, and to the spot they choose to repose in; who should make a fairy land of the scene of their elegant and innocent enjoyments. It seems to us to require very little poetry in the soul, very little reflection on the nature and province of art, to bring one's self to regard Mr. Turner's style of drawing as perfectly natural. His grand and general effects, in short, are true, although his details of colour are not exactly such as are every day seen.

But to indulge the most fastidious, what have they to object to the 'Stonehenge?' Surely there is nothing unnatural in this drawing! no extravagant tints, no gold, no gorgeousness! and what a subject too! yet what a picture! The proprietor of this drawing, Mr. H. Charles Heath relates a pleasant story respecting it. 'Mr. Turner,' he says, 'told him he had a drawing of Stonehenge, and asked him if he would take it for one of the views of England!' 'Stonehenge! such a subject!' 'But you may as well see it.' 'It would be of no use; the subject would never do.' Other drawings were proceeded with; on the back of one of these, Mr. Heath happened one day to cast his eye on the 'Stonehenge;' but he no longer objected to the subject, bad as he had deemed it. He eagerly purchased the drawing; and few, we are assured, are they who will condemn this change of resolution. The subject all will own was an ungracious one; but this very defect has only served to display the talent of Mr. Turner. He has chosen to represent the scene at the moment of a thunder-storm; the shepherd-boy, his faithful watch-dog, and a numerous flock, lie smitten on the ground; the sky is overcast with grand and gathered clouds, and amidst this storm of the elements, the huge masses rise in all their Druidical

majesty. The whole is an admirable specimen of artistic skill.

Another instance in which Mr. Turner has embodied his tone, where his subject would not lend itself to poetical effect, may be cited in his picture of 'Lowth in Lincolnshire.' It is not certainly the extravagance of the colouring that can be objected to in this drawing—the figures, perhaps, both men and beasts—but these are very unimportant parts of Mr. Turner's works.

Among the most beautiful drawings in the Gallery is the 'View of Richmond,' in Yorkshire, 'Kilgarren Castle,' 'Dartmouth Cove,' with 'The Seller's Wedding,' two of 'Virginia Water,' 'Eton'—but we should have to go through the list of the forty-one drawings, were we to name all that are excellent. It is observed, however, that an evident improvement between the earlier and more recent works of Mr. Turner is perceptible. The latter show clearly greater experience, and a more confident and masterly hand. The 'Views of Linnecottum' and 'Buckfastleigh Abbey,' which are among the weakest and tamest of the drawings, may be cited in proof of this remark.

THE CORONATION AT RHEIMS.

PAINTING BY M. GÉRARD.

WHILE the 'Tam o' Shanter and Souter Johnny' of Mr. Thoms are the season's rage in London, the 'Tableau du Sacre,' by M. Gérard, has been, at once, the cause and the object of a corresponding *surcraît* in the French capital. This picture was hung, about a month since, in the great Saloon of the Museum of the Louvre, in the place previously occupied by 'The Entry of Henry IV. into Paris.' It is displayed with great pomp, in honour to the exalted subject of which it treats; and, to make the exhibition a court affair, the Swiss and other keepers attend in their full-dress uniform and livery, while every care is taken to give effect to the painting itself, by protecting it from reflected and false lights, and from all deterioration from the vicinity of other vivacious colours, by green hangings, which cover on both sides the pictures near it.

In order to give action and life to his picture, M. Gérard has chosen for his point of time the moment when the Court and Ministers who assist at the important ceremony shout 'Vive le Roi.' The painting is brilliant; but the flesh part is objected to as too rosy and tinty, and as false: the drapery, and the velvet and silks which form it, are described as admirably executed: the composition is said to be pleasing, and the figures well arranged and drawn. The canvas contains about forty portraits, the greater part of them very successful resemblances; but it is observed, that those of the principal Ministers of the day, the Villèle triumvirate, who, of course, played their part in the ceremony, are not distinguishable. Had the picture been executed with more dispatch, it is probable, (says the critic,) that it would not have been, like the busts of Brutus and Cassius of old, by absence only that attention would have been drawn to the ex-Ministers.

PHILHARMONIC SOCIETY.

THE Veteran brothers, the Cramers, were for the second time this year, conductor and leader of one of the best Concerts of the season, forming the seventh, on the 25th ult. It commenced with a sinfonia never before performed in this country, composed by a new and juvenile aspirant for musical fame, of the name of Mendelssohn, who conducted it himself. He is the son of an eminent banker at Berlin, and like Meyerbeer, an amateur, and a musical genius of the very first class.

His sinfonia gave universal satisfaction, and was deservedly applauded. It consisted of the usual number of movements, a clever *Allegro molto* in C minor; was followed by a very quiet, sensible *Andante* in E flat; after which, in the usual place of the minuet, an unusually delicious, playful, and original scherzo in C

minor, (apparently written expressly for the occasion,) gave delight to every auditor, and was unanimously encored. It was performed by only a limited number of violins, tenors, and basses, but obligato for them, and all the wind instruments. The last movement resembled the first; an *Allegro* in C minor, and in it was exhibited very clever theoretical writing, scientific modulation, and good fusing counterpoint. The whole composition was sensible, clear, striking, and yet original, and a new sinfonia has never before been so eminently successful at the Philharmonic. If any resemblance could be found, it must be in the music so highly popular at the present moment, namely, Auber's opera, 'La Muette de Portici,' or the 'Crocato' of Meyerbeer; but certainly Mendelssohn's composition exhibited great originality, without that incoherent eccentricity, which Beethoven unfortunately had recourse to.

No. 2. Aria, Mr. Rosner, 'So reisend hold,' from Mozart's 'Zauber Flöte.' This was the second novelty of the evening—a new tenor singer, with a voice of considerable compass, also from Berlin. He sang Mozart's fine song quite well, in the original German, but took the time rather too slow. He is a polished, clever, and careful vocalist; but occasionally a little nasal.

No. 3. Concertante, piano forte and harp, Mrs. Anderson and Mr. Dixi, composed by Kalkbrenner and Dixi. This did not produce any very striking effect, or elicit extensive applause. Dixi had not any shewy or clever passages, and his harp was by no means exhibited to advantage. The Concertante was accompanied only by wind instruments, two flutes, two bassoons, and two horns. Much might have been done with such materials, but they were not efficiently employed. The middle movement was an ineffective adaptation of Mozart's 'Ah Perdonna,' commencing with the two flutes and harp, (quite in an amateur style à la Mazzinghi, or Latour,) and responded to by the two bassoons and piano forte. The concertante passages in the last movement were quite deficient in originality, and seemed to be formed upon the model of Cramer's exercises. If Dixi's position of his left hand be graceful or proper, (so near the sounding board, and with the thumb held downwards instead of upwards,) then is every other harp-player and teacher of that instrument holding false opinions, and promulgating erroneous doctrines. 'Why was this sort of thing exhibited at the Philharmonic?' says one professional member. 'D... is a director this season,' replies another!

No. 4. Scena, Miss Paton, 'Misera me,' from C. M. Von Weber's 'D'Atalia.' This was a clever and creditable exhibition, and Miss Paton deserves our best thanks for the pains she took to render a difficult piece interesting. Three very fine movements, an *Andante* recitativo, a beautiful *Adagio* in A flat, and an erudite *Allegro vivace* in E flat, were successively well performed.

No. 5. Weber's original, spirited, and striking overture to 'Euryanthe,' concluded the act, and was performed in the usual excellent manner. The wild and beautiful middle movement, performed 'con sordini' by the stringed instruments, was a little out of time and tune; but it exhibits such extraordinary modulation, that to make it 'go well' requires unusual talent and care.

No. 6. Mozart's magnificent sinfonia in E flat commenced the second part of the Concert, and was admirable, and admired as usual.

No. 7. Was another novelty: Madame Wraniskij, just arrived from Vienna, made her first curtsy to a British audience, and was well received. She sang the very estimable scena from Mozart's 'La Clemenza di Tito,' 'Non più di fiori,' and was beautifully accompanied by Willman on an F clarinet with a metal bell, representing a corno di bassetto. The want of this rather obsolete instrument has, perhaps, been the reason why Mozart's delightful song has not been so frequently heard. When Catalani sang it in the opera at the King's Theatre in 1811, this accompaniment was divided for violin, clarinet, tenor, and harp, (which latter instrument was especially applicable to the arpeggio accompaniment in the 3 8 larghetto,) and was performed by Weichsell, Mahon, Mountain, and Chaloner. Willman's accompaniment, however, was as usual, quite good, and the song went off excellently. Madame Wraniskij exhibited an extraordinarily fine and brilliant shake, and was much applauded.

No. 8. Concerto violin, Mr. Oury, composed by Kreutzer and De-Beriot. The Philharmonic audience have witnessed so much fiddling this season, that Oury's Concerto wanted freshness. He played extremely well,

but the performance was much too long. Kreutzer's first movement in D minor is in a sentimental melancholy style; his *andante* does not exhibit any thing more lively, and De-Beriot's variations were rendered tedious by Oury's repetition of each strain. The performance was highly creditable and clever, but rather deficient in interest, spirit, and shewy effect.

No. 9. Song, Miss Paton, 'If guiltless blood,' from Handel's 'Susanna.' This introduction of a little specimen of ancient music, (as in the sixth Concert,) answered exceedingly well, and Miss Paton sang very delightfully.

No. 10. Rossini's admired 'Amor! poscente nome,' from his 'Armida,' was by no means well performed by the Germans, Madame Wraniskij and Mr. Rosner. It was not the style for them. The Italians manage Rossini much better. Besides, the Duetto should not have been introduced at all. It added one piece more than usual to the Concert, which abounded with lengthy performances; and the audience took the hint, and began to depart before the finale, Cherubini's grand overture to 'Anacreon' commenced. The whole, consequently, concluded at a much later hour than ever we remember it.

THE DRAMA.

King's Theatre.

THE time that has elapsed since the performance which we were prevented from noticing last week, will have the effect of lessening the value of our observations, and must warn us, therefore, to make them as short as possible. Indeed, our only reason for reverting to this topic at all, is, that the opera produced on the night in question is the solitary exception to the general rule of the season, the only music not Rossini's, which we have heard in the King's Theatre. It is a very common and very sensible opinion, that musical taste changes its standard at certain intervals of time; no *beau idéal* having a longer period of supremacy than the third or perhaps the half of a single century. The cause of this fact might furnish food for much wise theory, and our own wisdom may at some idle hour hereafter be tempted to search for its unravelment. But at present we are content with observing that the most popular composer of the day cannot hope to preserve his glory even for this short season, unless there arise some other object to attract men's minds, and divide his empire; for the exclusiveness with which he has been admired, will lead to satiety;—and the grandeur of his fame will be the direct agent of his disgrace. For Signor Zucchelli's benefit, the opera of 'Don Giovanni' was produced a little while ago, and however differently people may shape their judgments, upon the relative excellencies of Mozart and Rossini, as operatic writers, we do not think there can be any doubt as to the refreshment of our own pleasure, and increased beauty of the compositions of either master, derivable from their being set in contrast, or rather in reciprocal relief. Were the variety of the duldest possible kind, we should still welcome it, for the wholeness of its consequences. But we do not take Mozart medicinally; and, though our appetites are strengthened by the draught, they become so by a process as agreeable as its effects.

But enough by way of preface.

Now to the performance. The great attraction of the night was Malibran's Zerlina, and never, in our memory at least, did the part fall into more efficient hands. On former occasions, we deemed the dramatic style of this lady somewhat too ferried and Asiatic, and her action too vehement and redundant; but on Saturday night this delusion (for we believe it such) vanished, and Madame Malibran revealed herself to our wondering eyes as the perfection of the vain and playful coquetting of low life. Mademoiselle Sontag appeared as Donna Anna. She seemed labouring under indisposition or low spirits; and these latter imparted a melancholy tone to her acting, which threw it into disadvantageous relief with Madame Malibran's. Nevertheless, towards the close of the Opera, she seemed to 'sparkle from the collision,' and her Aria 'Non mi di balla Idol Mio,' was sung in her best and happiest manner.

There is too much repose and luxurious stagnation about Zucchelli's rendering him an adequate representative of Don Giovanni. Of late, this admirable singer has acquired an aldermanic amplitude, which will be as fatal to his career in this walk of his profession, as Sir Joseph Yorke thinks the increase of salary will be to the cool judgment and clear discrimination of the Scotch Judges. Feeding lustily—or, to use the language of the gallant tar, 'blowing out one's jacket,'—is a sore destroyer of the *gaieté* and mobility of which the representative of Don Giovanni stands in need.

Pellegrini's *Leporello* made us regret that he is no longer 'dans sa première jeunesse.' Time, which, to use the German proverb, 'brings roses,' destroys them too.

Of Donzelli we can only speak in praise; and suffice it to say of Galli, that he was more effective than is his wont.

Covent-Garden.

GERMAN OPERA.—A second German edition of the 'Freischütz' was produced at this theatre on Monday, which we are happy to say was welcomed by a more crowded audience than had attended the first night of this performance. We did not, however, observe any vast improvement since last Wednesday, in John Bull's comprehension of the sprinkling of dialogue which the piece contains; nor any new modification of the grin with which he testified his sense of the more startling nasal or guttural evolutions of the faculty of speech in his outlandish entertainers. Nor was there any remarkable variation in the style of the performance: excepting that our foreign friends seemed rather more at home upon the boards, and on the whole, better acquainted with their audience. The broad comic humour of the drinking song was received with renewed plaudits; and Mr. Rosner's rich tenor, with his admirable ease, and the resistless force and feeling of his whole performance, only confirmed our first impressions of his merit. We beg pardon of the ladies for postponing their just claims to our first notice: which undoubtedly our natural impulse would have prompted us most warmly to bestow on them, if we had not felt ourselves somehow rather chilled by the majestic, not to say rather formidable, stature and bearing of the fair *Principal Soprano to the Duke of Hesse Cassel*, in whom we could wish for less Teutonic starch of countenance and drapery, happily relieved as it was by the all-intelligible archness and gaiety of her fair rival Madame Rosner, who looked *Hermia* to her *Helena*. We should be the last, however, to dispute the sheer straight-forward power of her voice and execution, although in our secret souls, like many of the audience, we might prefer the ease, spirit, and variety of her companion. Altogether we can promise those whose ears and eyes are unconstrained by the dictates of a squeamish and fastidious elegance, at least equal pleasure from this new and grand avatar of an old favourite arrayed in more than pristine life and energy, as they have lately been enjoying from the glare of a French ballet, or the liveliness, yet sameness, of a French vaudeville.

In the well-known farce which followed, Miss Covey, as Young Pickle, deserved the applauses which are naturally lavished on a very clever child, and a spoiled one. Her principal fault is her manner, which appears to us to be altogether too formed and womanish; and which, however it may please and surprise at present, will be a great bar to her improvement when she puts off childish things.

Of the piece we need say nothing, save (to those who have not seen it) that it is one of great pretensions with but little to support them, and, but for the imitable acting of Blanchard and Mrs. Davenport—names which we hope long to see placed in juxtaposition, and which are as naturally associated in our ideas as those of curry and rice, or Keely and Miss Goward—would be speedily consigned to the oblivion it deserves. Mr. J. Reeve, as Tag, infused into the part an humour peculiarly his own, particularly in the love, or 'Romeo and Juliet,' scene between him and Mrs. Davenport, which was, if we might judge by the moistened eyes of many of the audience, almost painfully comic. He played also the part of Bombastes in the next piece, and sung his 'Hope told a Flattering Tale,' with variations 'à la Sontag,' more to the taste of a large majority of the audience than would be—if we blaspheme not—the accomplished original.

PASTA AT VIENNA.—The appearance of Pasta at Vienna, in March last, seems to have created a sensation quite equal to that which was felt in England last year on the arrival of Sontag. Her principal performances were, 'Romeo and Julietta,' 'Tancredi,' 'Semiramide,' &c. The Rossini party at first showed themselves somewhat cynical, because she preferred the 'Romeo and Julietta' of Zingarelli to that of their idol, for her first appearance. Her subsequent performances, however, and her efforts in 'Tancredi' and 'Semiramide,' made ample amends even to the *Pesarese* party; and her efforts in these operas gained for her the hearts and voices of all, and the theatre resounded with universal shouts of *Bruce, bravissima!* She is spoken of by a German critic as a meteor or comet in the musical firmament, as one having the art, so rare in Italians, of sing-

ing while acting, and acting while singing; of ennobling the most insignificant *harlequin* music (Rossini's). Madame Pasta was also admitted to sing at the Burg Theatre, the theatre in the imperial palace, a distinguished honour, only granted when the emperor himself is desirous of hearing a performer. 'Romeo and Julietta' was the opera chosen for this occasion: at the close of it Pasta received a *Sevigné* and ear-rings, set with brilliants, and the title of first private songstress to his majesty the Emperor of Austria.

Before quitting Vienna, she performed *Semiramide* for her benefit. On this occasion, although the price of admission was doubled, her residence, where the tickets were dispensed, was beset by a throng of persons anxious to hear this 'queen of song' for the last time. The tickets were exhausted early in the day, and the receipts had amounted to a very considerable sum before nine o'clock in the morning. In the afternoon, not one was to be had for gold. She executed the part of *Semiramide* in the best style, and her efforts were appreciated by an enthusiastic audience. Rounds of applause followed her every time she withdrew; and on the conclusion of the opera, it seemed as if her hearers could not be reconciled to part with one who had given them so much delight. She was called for over and over again, and obliged to make her appearance on the stage three times successively. The presents she received amounted to 5000 francs; and she departed for Milan with the admiration and best wishes of every lover of music or acting in the Austrian capital.

PAGANINI, THE VIOLINIST.—The renowned Italian violinist, Paganini, was at Berlin in the course of the spring, where he indulged the musical population of that city with four concerts, in which he excited the astonishment and enthusiasm of crowded audiences by his wonderful and peculiar execution. It is described to be full of characteristic energy, southern fire, and effective instrumenting.

His performance on one string appeared quite miraculous. The hall in which the concerts were held, which is capable of holding 1200 persons, was full almost every time, at the unusual price of two dollars, (six shillings), each. After the conclusion of his concerts at Berlin, Paganini was expected to depart for London; and his admirers express a wish that the climate may prove more propitious to him than it did to Weber.

NEW MUSIC.

'When morning's light is gently breaking.' *The Barcarole*, sung by Mr. Braham, in the Opera of 'Masaniello,' composed by Auber. Mayhew and Co.

THE whole of Auber's 'La Muette de Portici,' performing under the title of 'Masaniello,' at the King's Theatre as a ballet, as an opera at Drury-lane Theatre, and at the Coburg as a melo-drame, presents music of a very interesting, striking, and original description, and must become highly popular; the Barcarole, sung by Braham especially, the edition of which published by Mayhew and Lee, has a pleasing lithographic sketch of the scene in which it is sung. This is the first publication of it we have an opportunity of noticing, but expect soon to review the greater part of the music in several shapes.

No. 1. of Rossini's Operas, arranged with embellishments for the Flute, by William Forde. Cocks and Co.

THIS is the commencing number of a new and interesting publication for the flute, upon a plan similar to the many we have before reviewed, as published by Cocks and Co., who must by this time have one of the best catalogues of useful and pleasing music for that instrument that can be met with. 'Moeé in Egitto,' is the opera chosen to begin with; and no less than seventeen pieces from it are neatly brought out, and stitched in a wrapper for the small price of 3s.

'Jenny Gray,' as sung by Miss Paton, Miss Wilkinson, and Madame Caradori Allan, the words by a lady, the music by F. Welsh. Harmonic Institution.

A VERY pleasing and appropriate continuation of 'Auld Robin Gray,' the poem describing his death and Jenny's second wedding with Jamie, and so prettily describing it that we were almost tempted to transcribe the words in our review. The music of Mr. Welsh, is (as might be expected) clever and characteristic, and each verse terminates with a few bars of the old song in a pleasing and ingenious manner. All who possess 'Auld Robin Gray' should obtain this termination of the story, and then Mr. Welsh's song would be one of the most successful publications of the day.

The favourite *Airs in Paganini's admired Opera 'L'Ultimo Giorno di Pompei,'* arranged for the Piano-forte, by A. Diabelli. Boosey and Co.

WE noticed, a short time since, an arrangement of this opera as duets for two performers on the Piano-forte, by the same person, which was very judiciously made, and well presented. This, therefore, is only a concentration of the two parts into one, and is equally well adapted and brought out.

'The evening Primrose,' a favourite ballad, sung at the Nobility's Concerts, written and composed for, and most respectfully dedicated (by permission) to, the Countess St. Antonio, by F. E. Lucy.

A VERY graceful, elegant, and expressive 'patis-mosaic,' in the beautiful key of A flat, written within the limited compass of nine notes, and therefore quite within the power of most voices.

The National Waltz, arranged with variations for the Flute, and an accompaniment for the Piano-forte, by Bernard Lee. Mayhew and Co.

THIS is offered as the second number of a series of airs adapted for the Flute and Piano-forte, (the 1st was noticed in the Athenæum, No. 79, p. 271,) in a familiar and useful manner. It is expressly well arranged for the Flute, with eight shrewd and clever variations, and it must form an unusually good teachable lesson.

'The bright, the golden sunbeam.' *The Introductory Chorus in the celebrated opera, 'Das Unterbrochene Opferfest, or the Interrupted Sacrifice,'* composed and arranged for two or four voices, by Peter von Winter. Ewer and Johanning.

THE music of this opera is now a little stale; but, as the above has been recently sent to us, as a fresh arrangement, we notice it accordingly. To glee and duet singers, such as warble forth 'Glorious Apollo,' 'To all you ladies now at land,' and 'Away with Melancholy,' this publication may be warmly recommended, as an appropriate companion.

'Introduction e Rondo Giocoso, for the Piano-forte, composed and dedicated to Miss de Humboldt, by Cipriani Potter, op. 20. Clement and Co.

MR. POTTER is a credit to our English school of musical writers, an unusually industrious and well-informed composer. His Rondo is a clever and brilliant effusion in the showy key of E, requiring and deserving a good performer to do it justice. Mr. Potter aims at music of a higher class than the numerous puerile productions of the present day, and aims successfully.

LAW INSTITUTION.

FROM the report in the Daily Journals of the proceedings at a meeting of the Law Institution, held last week, it appears that the designs of Mr. Vulliamy* have been approved of for the new building about to be erected in Chancery-lane. A premium of 50*l.* was also awarded to Mr. Donaldson† for his design, which was considered by the Committee the best suited to their purposes after that of Mr. Vulliamy.

According to the explanation of the Chairman of the above-mentioned meeting, the objects of the Institution are, to form the profession into an associated and recognised body, to facilitate the transaction of legal business, to render the practice uniform, and by the collection of a complete law-library, and of every species of useful information, to meet the wants of a great and powerful body in the general exercise of a liberal profession. Several members, it seems, have already made numerous donations to the library of useful and expensive works; and many valuable publications have been received from authors and editors. The small sum of 375*l.*, the amount of fifteen shares, was all that remained unsubscribed of the proposed capital of 50,000*l.* It is expected that the building will be covered in by Lady-day next, and that the members may meet in their own hall at the next annual meeting in June.

* Mr. Vulliamy is the author of a much-esteemed work on Greek ornament, and it is under his superintendence that the elegant Gothic chapel on the estate of Lord Holland at Ken-sington has been lately erected.

† Mr. Donaldson is even more known than Mr. Vulliamy, as a contributor to our knowledge of Greek art and antiquities, and as the author more especially of one of the supplementary numbers to the grand work of Stewart's Athens. The new church at Brompton is built after his design.

THE PRIMARY PARENTS OF THE HUMAN RACE.

(From a Correspondent.)

In the study of natural history there is nothing more difficult than the formation of an unobjectionable arrangement of the organised part of the creation. Let naturalists adopt what classification they may, there are always found individuals approximating so nearly to those they seem to connect, that, after the closest examination, it frequently remains arbitrary as to which of their neighbours they most appropriately belong. A connecting link is found between every species of organised nature, from the plant to man. The different genera and species of the animal kingdom are distinguished by colour, form, and habit; and it is a striking peculiarity, that of the mammalia no two species have precisely the same anatomical structure. I am led to these remarks by the work of M. Bory de St. Vincent, (a notice of which was given in 'The Athenæum,') wherein he points out the improbability of the human race having but two primary parents. It is agreed among naturalists, that each species of animals had originally its own peculiar parents. M. Bory divides the human race into fifteen species. If he is correct; if these are really distinct species; that is, if these fifteen species are the progeny of fifteen primary couples, it must be acknowledged a remarkable anomaly that Nature, whose characteristic is love of variety, should have formed so many species resembling each other, in every respect except colour, which even in the same individual undergoes a material alteration by change of climate; size, which varies in each family; and the hair, which in some varieties is crisp, in others straight. All the human race have the same number of limbs, similarly situated, and the same number of muscles. All have thirty-two teeth; all have a frame composed of two hundred and forty-one bones: in short, the only apparent difference of structure is a greater or less prominence of the upper jaw-bone. No two species of quadrupeds, as I before observed, are to be found, with so slight a difference of structure. Zoologists agree, that all dogs (the *Canes familiares* of Linnæus) are the descendants of a single primary pair, and all dogs have precisely the same organic structure: yet who will not say that a far wider difference is perceptible in certain varieties of that species than in man? Some dogs have much the appearance of the fox; others, of the wolf: but naturalists do not imagine these three to be of the same race; and here again nature has constructed them thus differently: all dogs have six lumbar bones; the fox and wolf have seven: dogs have twenty-two caudal bones; foxes twenty, and the wolf has nineteen. Again; a superficial observer would imagine that there is no greater difference between the two and the three-toed sloth, than between a European and an Hottentot; but, in addition to the one having an extra toe, there is invariably found this distinction: of spinal bones, the two-toed sloth has, seven cervical, twenty-three dorsal, two lumbar, four sacral, and seven caudal: the three-toed sloth has nine cervical, fourteen dorsal, four lumbar, three sacral, and thirteen caudal. The ostrich and cassowary present appearances differing not more than the extremes of mankind; but the former has invariably two toes, the latter three. It may be observed, that, if the different varieties of the human race be admitted to be of the same species, the orang-outang differing apparently only in his covering and habits, may be referred to the same origin; but here, also, the anatomical structure differs: all quadrupeds, including the whole genus simia, have two bones in the face in addition to those found in man.

After this manner has nature stamped a difference in the organization of each species of quadrupeds; the same anatomical structure being given to the whole of the human race is, then, one substantial argument in favour of the hypothesis that the varieties of mankind are the descendants of but two primary parents.

To account for the change that has taken place to form the characteristic distinctions of the varieties of man, (supposing all to have arisen from one pair,) which distinctions are difference in colour, feature, and the hair being straight or crisped, does not seem to be an insuperable difficulty, if we may compare the human being with other parts of animated nature. As respects colours, for instance, what person, unacquainted with the effects of cultivation, would believe that the polyanthus is produced from the self-same root as the cowslip; the crimson double daisy from the common meadow daisy; or the ranunculus from the root of the butter-cup? As a very few years of cultivation suffice to effect these changes, we may

look upon an experiment of this kind as a demonstration that the physiological differences in organised bodies are occasionally produced by the peculiar differences under which they are circumstanced. As respects form, change of circumstance effects a greater difference in appearance in many parts of the vegetable kingdom than can be found in the extremes of the whole human race. The rough-leaved snake-weed, if removed into a soil differing from its natural one, produces smooth leaves; and, if the same plant be afterwards returned to its natural soil, it again throws out rough leaves. Many flowers, the corolla of which is composed of a single circle of petals, become, by cultivation, what are termed double and full flowers, in which case the stamens, organs however different in shape, are nevertheless converted into petals. Many of our domestic animals, on being transported to South America, become, in a short time, materially altered. According to M. Roulin, the hog quickly assumes the ferocious habits of the wild boar. 'European horses and horned cattle, also, soon become wild; and it is with the utmost difficulty they can be retained for domestic purposes.' The cow no longer affords the usual supply of milk; 'immediately the calf ceases to suck, the milk dries up;' if the sheep are left unshorn for a season, the wool falls off in patches, and its place is supplied by 'a short, shining, and close hair, exactly like the hair of the goat in the same climate; and where this hair once appears, there is never any return of wool.' M. Bory quotes, 'If naturalists saw two insects or two quadrupeds so constantly different by their exterior forms and permanent colour as the white man and the negro, notwithstanding the spurious offspring may result from their intercourse, they would not hesitate to set them down as two distinct species.' Now an argument fairly parallel is this: show a person, ignorant of the laws of vegetation, a single damask rose, and likewise a double white rose, and ask him if he suppose they are the fruits of originally the same root? That there is a greater difference in these flowers than is perceptible in any two of the human race, cannot be denied: in the double white rose, there are no longer stems; they are converted into petals. It is true, that, in point of colour, we do not look for a greater contrast than black and white, but the fairest of our race is tawny in comparison to the whiteness of the rose. As it is in every one's power to observe the variety produced from a single plant allowed to grow under different circumstances, we cannot but naturally allow that a change, comparatively small, may have taken place in the human race.

In admitting the present variety of mankind to be the descendants of only two primary parents, the circumstance most difficult to be accounted for is their manner of becoming scattered over the whole earth; the manner in which they were removed into countries divided from each other by wide seas. In admitting more than one primary pair, we do away with all possibility of a deluge having ever taken place; for if the deluge was general, there must have been many arks, many Noahs, and arks for each species. If a deluge never took place, or was only partial, inundating only so much of the world as was at that time known, and not the whole globe,—if this were the case, naturalists must fly to some other event to account for what are now considered as antediluvian remains.

Thus, without appealing to the scriptural authority, it would seem, judging from analogy, that the human race are but varieties of the same species, since the whole race has in every respect the same anatomical construction; and comparative anatomy teaches us that of the rest of the Mammalia, each species has an anatomic construction differing in some respect from every other species: that to account for the different features, colours, and habits of mankind, requires not that we admit of more than two primary parents; for we find greater differences exist in the fruit of many other orders of organized nature: and that the admittance of more than two primary parents, either makes it necessary that at the deluge two of each species (inhabiting countries widely apart) must have been saved, which is improbable; or infers that no deluge, or only a partial one, ever occurred,—which geologists will aver to be impossible.

ORIGIN OF THE WORD CZAR.—The word Czar is of Georgian origin, and is to be found used in the signification of Lord or master in the Slavonian translation of the Bible, in which it designates the sovereign power of ancient times. The Annalist, Nestor, in fact, gives the title to the Greek Emperor; and even at present, speaking in Russian, Constantinople is called even by persons of the lower class, Zaregrad, city of Czars.

VARIETIES.

NEW MINERALS OF CULEBRAS IN MEXICO.—In the 'Annales des Sciences Naturelles,' M. Del Rio gives an account of two new minerals, found at Culebras, Mexico, by M. J. Herrera. The first resembles hepatic cinnabar, and was found accompanied by native mercury, in the calcareous matter lying above the red freestone. This mineral, under the action of the blow-pipe, burns with a violet-coloured flame; it discharges a smoke which has the odour of putrid cabbage, and leaves a residue of greyish white earth. It is found in company and adhesively mixed with another mineral, so like grey silver, that M. Del Rio, as he confesses, was himself deceived by it. The simple consideration, that grey silver and cinnabar are not found together, made him doubtful. The dust of it is blacker, and stains more, than that of grey silver. It gives, under the pipe, the same result, as the red mineral; its specific gravity was 5.56; that of the red mineral was 5.66, differing considerably from that of the hepatic cinnabar, which exceeds 5.8. M. Del Rio gives to the second-mentioned mineral the name of 'Grey Mineral.' He found its constituent parts to consist of selenium 49, zinc 24, mercury 19, sulphur 1.5, lime 6; total 99.5. The mineral, according to the author of the description, is a bi-selenite of zinc with a proto-sulphite of mercury, which gives it the grey colour. The red mineral he concludes is another bi-selenite of zinc with a bi-sulphite of mercury, whence it derives its red colour.

INFLUENCE OF THE AURORA BOREALIS ON THE MAGNETIC NEEDLE.—A difference of opinion exists between M. Arago and several English philosophers, and especially Dr. Brewster, as to the limit of the extent at which the Aurora Borealis exercises a perceptible action on the Magnetic Needle. M. Arago, on the strength of a number of observations of his own, maintains that the action of the Aurora Borealis operates in a sensible manner in places where that phenomenon is not visible. In support of his opinion, M. Arago has recently referred the French Academy of Sciences to the observations addressed to them by the Professor of Casan, in Siberia, and which confirm, he alleges, in the most satisfactory manner, the truth of his assertion. These observations show a continued correspondence between the movements observed, in Paris, in the Magnetic Needle, and the appearances of the Aurora Borealis perceived at Casan. M. Arago reminded the Academy, that these coincidences, remarkable as they were, in consequence of the great distance between the two towns, become still more so when it is taken into consideration that there is every reason to believe that Casan is not subject to the influence of the same magnetic pole. A great number of magnetic phenomena do not seem capable of explanation, on the supposition of a single magnetic pole, and every thing tends to countenance the idea, that in Siberia there exists a peculiar one, which exercises an influence on all the neighbouring regions.

COLOURING MATTER OF LOBSTERS.—In the 'Précis Analytique des Travaux de l'Académie de Rouen, pendant l'année 1828,' M. Germain maintains that it is a mistake to suppose that the red colour assumed by lobsters when cooked in water, is owing to a colouring principle contained in a membrane adhering to the inner part of the shell. According to M. Germain, this colour exists already formed: the shell, he says, consists of three distinct layers, the first or outer layer is very thin, and composed of a calcareous substance, on which is applied, or which has intimately connected with it, a green olive colour more or less deep; the second or intermediate, also very thin, adheres firmly to the former, is composed of the organic part of the shell, and contains the whole of the red colour, of which boiling, or the action of divers agents will occasion the development; the third or innermost layer is much thicker than both the others together, and consists only of carbonate of lime quite colourless.

NEW COMPRESSION PUMP OF M. THILORIER.—At the sitting of the Academy of Sciences of the 16th May, 1500 francs, as the Monthyon prize for mechanical inventions, were awarded to M. Thilorier, for the best contrivance for a compression pump. M. Navier, in making the report of the committee, described the object and mode of operation of the invention. From these it appears that, with the machine of Thilorier, six men are able to compress, to the thousandth part of its bulk, at each rising and sinking of the piston, a volume of air equal to six hundred and forty-five cubic centimetres (21 feet 2 inches cubic). With the ordinary machines, 200 men would be required to produce the same effect.

COMPLETE TREATISE ON CHEMISTRY, BY M. BERZELIUS.—A French edition of 'The Treatise on Chemistry' of M. Berzelius, the Swedish chemist, is in the course of publication at Paris, by MM. Didot. In order to render this edition more complete, and something more than a mere translation of the German publication, the author has transmitted to his publishers a quantity of new MSS. The 'Complete Treatise on Chemistry' will form eight thick volumes. The first four will comprise mineral chemistry, the fifth and sixth vegetable chemistry, the two last animal chemistry, with an alphabetical arrangement of instruments, apparatus, and experiments. This forms a record of the results of the long experience of the author. In writing this work, the great object of M. Berzelius has been to render the study of chemistry easy to the uninitiated.

M. GAY-LUSSAC'S LECTURES ON CHEMISTRY.—A course of chemistry, by M. Gay-Lussac, being the substance of thirty-three lectures on salts and vegetable and animal chemistry, was also published in Paris in the course of last year, by Puhon and Didier.

GERMAN CHILDE HAROLD.—The first Canto of 'Childe Harold' has been translated into German by Zedlitz, and will be published in 'The Agaja' annual for 1830.

COPYRIGHT IN GERMANY.—The exertions of the Prussian Government to procure an agreement between the various German states, for the purpose of securing the property of authors and publishers against the injury of counterfeit editions, have already been attended with many satisfactory results, and States, which until very recently, were wholly wanting in any fixed legislation on the subject of the press, are now enjoying the advantages of established laws for securing copy-right. Among the other Sovereigns who have complied with the instances of Prussia, is the Duke of Coburg-Gotha, who, in the course of last autumn, promulgated against the infraction of copyright, a law distinguished for its completeness and precision. It contains thirteen articles, of which the first eight concern the counterfeiting of books, and the acts which render it unlawful. The relations between authors and publishers are regulated in the third article. According to this; thirty years after the death of the author, the copyright ceases both in the executor and the publisher. The four following articles impose penalties for infraction; and the thirteenth charges the censors to enforce the observance of the law.

SUICIDE IN FRANCE.—The rage of suicide has attacked not only every class, but almost all ages: a child of twelve years old, living at Auxonne, has blown his brains out with a pistol, owing to some affront or other he had taken from his parents.

The suicides which have taken place at Marseilles in 1825, 1826, and 1827, amount to seventy, of which fifty-two are men, and eighteen women. In the six summer months of these two years, there were forty-eight suicides: in the six months of winter, only twenty-two. England is now by no means the country where suicide occurs most frequently. More suicides have of late years taken place in France than in that country; and it appears that the principal focus of that malady is in Germany.

INHUMAN INHUMATION.—The repairs in the cemetery of a commune, in the neighbourhood of Verdun, have opened up a tomb, in which was given to view the skeleton of a man, having his hands behind his head, grasping and filled with his hair. It should seem, that this unfortunate, interred while yet alive, must have torn them away in his despair. Here is a new example of the dreadful risk attendant on precipitate burial.

CAPITAL PUNISHMENT.—The state of New York has lately come to a resolution, according to which the infliction of capital punishment will take place in the interior of the prisons, in the presence of the sheriff alone, and not in public; as experience has demonstrated, that public executions, rather tend to harden the witnesses of them than to add to their abhorrence for crime; and that, besides, they give occasion not unfrequently to disorders.

MARINO FALIERO AT PARIS.—The difference between M. Delavigne and the Committee of the Théâtre Français, and the conversion of the tragedy of 'Marino Faliero' into a melodrama for the Porte-Saint-Martin, where it has experienced most unequivocal success,* has been laid hold of as the subject of a pleasant little piece of caricature at the Théâtre du Vaudeville. Marino Faliero, ill-treated in London, arrives in Paris by the Omnibus. Henry III. offers him apartments in his

palace, in the Rue Richelieu; * but the old Doge, who is still sensible to the charms of a pair of youthful sparkling eyes, prefers sparkling Charlotte Corday to the Porte-Saint-Martin. In vain, however, would he follow his own inclination. Pertinax, Saint-Mégrin, and Agamemnon seize him by the throat, and drag him, loaded with chains, to the colonnade of the Théâtre Français. The poor Faliero trembles from head to foot; surely will be condemned to be massacred by La Fontaine. On a sudden, a clap of thunder is heard, and the statue of Voltaire becomes animated; this venerable judge, standing, pronounces from his tribunal an excellent sentence, which, notwithstanding the clamour and petitions of the classicals, establishes the liberty of the stage, and the sovereignty of the people in matters of taste. The singing then recommences, and Voltaire takes his seat to listen to a vaudeville, in which the classicals and the romanticists, the inventors of patent soup, the gascon eloquence of the Minister, and other farces of the day, are shown up for the amusement of the audience; and, if the authors, says 'Le Globe,' are not deserving of much praise, the censors certainly are.

STATE OF THE MARINE IN GREECE AT ANCIENT EPOCHS.—M and M. Poirson Cayx, in their recent work, entitled 'Précis de l'Histoire Ancienne,' give the following comparative table to prove the state of degradation into which the Greeks had fallen, between the war of Troy and the invasion of the Persians, and especially after the invasion of Attica by the Ionians and Æolians, driven by the Heraclides from the Peloponnesus.

State of the Marine in Greece at the commencement of the Trojan War.	At the commencement of the Persian War.
Number of Vessels.	Number of Vessels.

LITERARY INTELLIGENCE.

Mr. Mansel, of the Middle Temple, Author of 'The Law and Practice of Demurrer,' &c., is on the eve of delivering a course of Lectures on the Principles and Practice of the Law of England as applicable to civil actions.

The Author of 'Reginald Trevor' has a new novel in the press, entitled 'Lawrence Mertoun; or a Summer in Wales.' It is descriptive of modern Welsh manners, and contains some lively sketches of character, especially referable to the Highlands of Merionethshire.

The Italian Library of Mr. Wilbraham will be sold by auction, to-morrow, at Mr. Evans's Rooms, in Pall Mall.

LIST OF BOOKS PUBLISHED DURING THE WEEK.

Sun's hor. motion on Sunday, 2' 25" plus. Logarithmic num. of distance, .006633.

BARNETT'S SONGS of the MINSTRELS, Vol. II. Price 15s.

'These compositions are entitled "Songs of the Minstrels," and do equal honour to the Poet and Musician. The Portuguese Minstrel, "The Spot where I was Born," is particularly beautiful; and the Russian "Maid of Tartary," highly striking and original. These two, with the Neapolitan and Turkish, four of the twelve, are fully equal to the best of the first volume; indeed, there is not one which does not boast of some of the merits peculiar to this extremely pleasing and delightful publication. Mr. Barnett is the cleverest and most tasteful of English composers. The Poetry is by the late Harry Stoe Van Dyk.'—*Vide Literary Gazette.*

Published by Mayhew and Co., 17, Old Bond-street, Where may be had the following New Songs:—

'Rise, gentle Moon,' sung by Miss Love, with the most enthusiastic applause, and nightly encored, in the historical drama of 'Charles XII.,' composed by John Barnett, with a beautiful Lithographic Portrait of Miss Love, 2 6

'My sweet Guitarr,' sung by Miss Love with distinguished applause; composed by John Barnett, 2 0

'Here's a Health to Merry England,' National Song; sung by Mr. Braham, composed by John Barnett, 2 0

'Listen to my Wild Guitarr,' written as a companion to the celebrated Serenade, 'The Light Guitarr,' composed by John Barnett, 2 0

'The Chimes of Zurich,' sung by Miss Love, written by Harry Stoe Van Dyk, composed by C. E. Horn, 2 0

'Sweet Evening Star,' answer to Barnett's celebrated song, 'Rise, gentle Moon,' composed by Joseph Hart, 2 0

LAW INSTITUTION.—At the Third Annual General Meeting of Members, held in Furnival's Inn Hall, the 2nd June, 1829, WILLIAM TOOKE, Esq., F.R.S., in the Chair, read the Report of the Committee of Management.

Resolved,—1. That the Report, now read, be approved and entered on the minutes, and printed for circulation among the Subscribers, and for the information of the profession generally, under the direction of the Committee.

2. That Michael Clayton, Thomas Dawes, and Peregrine Deatry, Esqrs., be elected Auditors for the ensuing year.

3. That the Committee prepare rules and regulations for the government of the Subscribers frequenting the Institution, and recommend such particular hour or hours in each day as may be most convenient for professional men to assemble in the hall, and that such rules and regulations, and the recommendation of the Committee, be submitted to a general meeting, and a copy thereof sent fourteen days before such general meeting to each Member.

4. That the thanks of this Meeting be presented to the Committee of Management, for their valuable services during the past year, in accomplishing the acquisition of a most eligible site, and in obtaining a subscription adequate to the immediate object of building according to the plan proposed. (Signed) WM. TOOKE, Chairman.

5. That the thanks of the Meeting be presented to the Chairman, for his able and impartial conduct in the Chair. (Signed) R. MAUGHAM, Secretary.

No. 19, Chancery-lane.

DR. KITCHNER'S ZEST.—This incomparable Flavour for Soups, Gravies, Made Disables, Game, Poultry, Fish, &c., the sole invention of the late Dr. Kitchner, and repeatedly mentioned by him in 'The Cook's Oracle,' is now prepared from the Doctor's original recipe, and likewise sold by JAMES BUTLER, Herbalist and Seedman, Covent-Garden Market, whose name is written on the direction for its use, without which none are Genuine. The Zest is particularly adapted for families travelling, imparting its delicious taste on immediate application. It will keep for any time, in any climate.—Sold also by Messrs. Knight and Sons, Italian Warehouse, 83, Gracechurch-street; and by Mr. Hickson, Italian Warehouse, 72, Welbeck-street, Cavendish-square; and Mr. Lazenby, 46, Lamb's Conduit-street; in bottles 2s. 6d. each.

* The copyright has been purchased by L'Avocat, at the price of 13,000 francs.

Just published, by J. Power, 34, Strand.
NEW VOCAL MUSIC, by Mrs. ROBERT ARBUTHNOT. — 'Richard the Brave,' a Legend; the Poetry by Thomas Campbell, Esq.; price 2s. Also, a Set of 6th Songs, price 10s. 6d.; the Poetry selected (by permission) from the works of Mr. Keats, Mrs. Ogle, Sir Walter Scott, Bart., Thomas Moore, Esq., and William Spencer, Esq.; containing—
 Them be it so.
 Bess! thou art the sweetest flower.
 The Greek Exile.
 One hour with thee.
 Poor Louise.
 Beth Geier.

THE SECTARIAN; or the Church and the Meeting-house. In 3 vols., post 8vo., 27s.

This day is published, handsomely printed in 8vo., price 15s. each, in boards, Vol. I. and Vol. II. of

HISTORIC SURVEY OF GERMAN POETRY, interspersed with various Translations. By W. TAYLOR, of Norwich.

Published by Treuttel and Wirtz, Treuttel, Jun., and Richter, 55, Strand-square.

Vol. III. is in the Press, and will complete the Work.
 'This is a valuable, philosophical, and poetical Miscellany for all lovers of German literature. We respect Mr. Taylor as one of the genuine lovers of literature for its own sake;—he is no book-monger;—his own compositions are, as it were, shown out in a course of study. He has never aimed at making and working up his productions to some staring model, which happened to attract the vulgar gaze of the day. All his qualities, both literary and personal, are sterling.'—*Quarterly Review*.

'The author has displayed a knowledge of the poetic literature of Germany, which, we think, is as yet unrivalled in this country. His criticism of individual authors is by far the shrewdest and most enlightened which we have seen on German authors proceeding from an English pen. It is evident that the author must be thoroughly acquainted with the language;—may, that he must be very familiar with the German mode of thinking on science, poetry, and religion.'—*Edinburgh Review*.

'The title of this work does not indicate nearly all its value. The biographical notices, of which there are many, and about which the title is silent, will probably be thought generally the most interesting portion of the work. There are five indeed of Bodmer, Klopstock, Haller, Lessing, all naming and instructive. For ourselves we confess that, while pleased and edified with every department of this volume, the critical also omitted in the title, is that which has afforded us the highest pleasure and instruction. The mind of the author is penetrating, more, perhaps, than comprehensive; and yet there are many instances here of analysis and combination, both as to motives and conduct, during long periods, and in reference to great interests, which prove not only that Mr. Taylor is a learned and enlightened man, but also that he is an intrepid, original thinker, elevated and removed far beyond the regions of common-place.'—*Scottish Review*.

London, June 10, 1839.
MR. BUCKINGHAM'S LECTURES, or
 Extensive Descriptions of the several Countries of the Eastern World, will be COMPLETED on the following dates; namely:

At THE CITY CONCERT ROOMS, FINSBURY CIRCUIS.
 Persia Wednesday, June 18.
 India Friday, — 19.
 Commerce of the East Monday, — 18.
 At THE KING'S THEATRE, HAYMARKET.
 Mesopotamia Tuesday, June 16.
 Persia Thursday, — 18.
 India Saturday, — 20.
 Commerce of the East Tuesday, — 22.

The City Lectures will commence precisely at Eight o'clock in the Evening; and those at the King's Theatre, at Three o'clock in the Day.—Admission to Mesopotamia, Persia, and India, 5s. each; and to the Commerce of the East, 2s. 6d.

EXHIBITION OF DRAWINGS, by J. M. TURNER, Esq., R.A., consisting of VIEWS IN ENGLAND AND WALES, executed for a Work now in course of publication, at the Large Gallery, Egyptian Hall, Piccadilly. Admittance, by Tickets only, which may be obtained (gratis) of the publisher, Mr. Jennings, 2, Poultry; at the Gallery; and 225, Oxford-street.

Open from Ten till Six.

CAMBRIDGE UNIVERSITY ELECTION.
AT a MEETING held in Trinity College, at one o'clock, on Monday, June 1, 1839, it was agreed that the following Notice should be circulated among the Members of the Senate:

'TO THE MEMBERS OF THE SENATE.
 On the probable vacancy in the Representation of the University, we, the undersigned, beg leave to submit to the Members of the Senate the following considerations respecting Mr. Cavendish.

It can rarely happen that we should have an opportunity of returning a Member so qualified in every respect for the representation of the University. He has adorned a hereditary connection with science by his own eminent talents and attainments. During the whole of his residence among us, his conduct was according to the true spirit of our institutions: his situation and his disposition are such, that we feel confident the fulfilling of the duties of such a station, and promoting the welfare of literature and science, will form the main object of his life, and that he will become closely identified with the interests and feelings of the University.

We, therefore, beg leave to inform the Members of the Senate, that on those grounds we intend to put Mr. Cavendish in nomination on the day of Election, in the earnest hope that the opinions we have now stated may be speedily sanctioned by their approbation and support.

'J. LAMB,
 Master of Corpus Christi College, Chairman.'

Wm. Smyth, Professor of Modern History, St. Peter's College.
 J. Henslow, Professor of Botany, St. John's College.
 G. B. Airy, Plumian Professor of Astronomy, Trinity College.
 J. Cumming, Professor of Chemistry, Trinity College.
 T. Minnigrove, Lord Almoner's Professor of Arabic, Trinity College.

W. Whewell, Professor of Mineralogy, Trinity College.
 Geo. Pryme, Professor of Political Economy, Trinity College.
 Towneley Clarkson, Jesus College.
 William Jones, Fellow and Senior Dean of St. John's College.
 J. Bowstead, Fellow of Corpus, and Moderator.
 T. S. Hughes, late Fellow of Emmanuel College.
 J. Lodge, Fellow of Magdalene College, and Librarian of the University.

Martin Thackeray, Vice-Provost of King's College.
 R. Dawes, Fellow and Tutor of Downing College.
 Marmaduke Ramsey, Fellow and Tutor of Jesus College.
 Joseph Romilly, Fellow of Trinity College.
 J. C. Hare, Fellow of Trinity College.
 George Peacock, Tutor of Trinity College.
 T. G. Hall, Fellow and Tutor of Magdalene College.
 C. Thirlwall, Fellow of Trinity College.
 H. Coddington, Fellow of Trinity College.
 H. Ariett, Fellow and Tutor of Pembroke College.
 P. Malkin, Fellow of Trinity College.
 W. J. Bayne, Fellow of Trinity College.
 J. A. Jeremy, Fellow of Trinity College.
 J. Challis, Fellow of Trinity College.
 S. W. Wand, Fellow of Magdalene College.
 T. Worsley, Fellow and Tutor of Downing College.
 C. Currie, Fellow of Pembroke College.
 J. A. Barnes, Fellow of Trinity College.
 S. Tennant, Chaplain of Trinity College.
 J. S. Upton, Trinity College.
 T. Thorpe, Fellow of Trinity College.
 T. Riddell, Fellow of Trinity College.
 Ralph Blakelock, Fellow of Catharine Hall.
 R. Wilson, Fellow of St. John's College.
 L. Stephenson, Fellow of St. John's College.
 T. Davies, Fellow of Jesus College.
 H. Battiscombe, Fellow of King's College.

At a Meeting of the Members of the Senate resident in London, held this day at the British Coffee-House, Cockspur-street, Professor Babbage was the Chair.

It was resolved,—That this Meeting fully concurs in the sentiments expressed by the resident Members of the University in favour of Mr. Cavendish, and does hereby express its cordial approval of their intention to put him in nomination, and its determination to support him at the Poll.

June 2, 1839. CHARLES BABBAGE, Chairman.
 Since the passing of the above Resolution, Mr. Cavendish has declared himself a Candidate, and is gone to Cambridge.

On the 1st of June was Published, Price only 2s. 6d.

Part VII. of
THE EXTRACTOR; or, Universal Repertorium of Literature, Science, and the Arts. The present Part contains—Travels in Arabia—Effects of Galvanism on the Animal Structure—Songs of Burns—Temple of Ypsamboul—The new Colony on the Swan-river—Coast Lights on a new principle—The two Emilias—Exemption of Operative Tumours from pulmonary consumption—Rice Paper—Writhe the Painter—Mr. R.—d's Dream—The Court of Napoleon—Description of Jerusalem—The Cause of Dry Rot Explained—Recollections of a Night Fever—Convent of St. Bernard—The Emperor of Austria—Transplantation of Grown Timber Trees in Phenology—Steam Navigation—Beet Root Sugar—Gastronomy—Ticks in Animals—Opium—Dr. Chalmers—The Borneo of Arnheim—The Waverly Novels—English Paper—Races for Connoisseurship in Painting—French Criminal Trials—Captain Owen's Plan for Bating Chronometers—Visit to the American President, Jackson—Mountain Storms and Slides in America—Origin, Nature, and Number of Sutures—Poisonous effects of Fresh Water on some Marine Animals—The Editor in his slippers—The first and last Kiss—Modern Jewish Customs—Fragments of Teaching—Public Records—The Proverbs of Solomon—Three Years at Cambridge—Wits and Authors—Cavalry Tactics—Dogs—Remember Me—Varieties, &c. &c.
 Published at 'The Extractor' Office, 120, Fleet-street; and may be had of all Booksellers.

THE following is a copy of the **CIRCULAR** addressed by Mr. CAVENDISH to the Members of the Senate:

'Cambridge, June 2, 1839.
 Sir,—Finding that a considerable portion of the Members of the Senate have determined to do me the high honour of nominating me at the approaching Election for the University, I feel that it is impossible for me to decline so flattering a mark of their approbation.

If the support of the Members of the Senate should place me in the honourable situation of your Representative in Parliament, no exertions on my part shall ever be wanting to prove that I am mindful of the important Trust reposed in me, and of the duties which attach to so distinguished a station; and you may be assured, that the main object of my life shall be to support the rights and promote the interests of the University, with which my feelings have been long identified.

On these grounds, I venture respectfully to solicit your support on the day of Election.

I have the honour to be,
 Sir,
 Your faithful and obedient Servant,
 'W. CAVENDISH.'

TO THE MEMBERS OF THE SENATE OF THE UNIVERSITY OF CAMBRIDGE.

MR. CAVENDISH'S COMMITTEE respectfully announce, that the Day of Election is fixed for Tuesday, the 10th instant. The Poll will open at Eight o'clock in the Morning, and close at Four in the Afternoon of that Day and Wednesday. It will close finally at the Senate of Thursday.

Arrangements have been made for facilitating the convenience of Members of the Senate, both to and from Cambridge, with all possible expedition.

Mr. Cavendish's friends have provided ample accommodation, at Cambridge, for his Out-voters.

It is requested, that all inquiries and communications may be addressed to Mr. Cavendish's Committee, who sit constantly at the British Coffee-house, Cockspur-street.

CHARLES BABBAGE, Chairman.

June 9, 1839.

CAMBRIDGE UNIVERSITY ELECTION.

MR. BANKES has addressed the following Circular to the Members of the Senate:—

14, George-street, Hanover-square, June 8, 1839.
 Sir,—The Election for the University of Cambridge being fixed for the 10th instant, to continue on the two following days, I beg again to solicit your Vote upon this occasion; and, should I be honoured by your support, to request very earnestly your early attendance at the Poll.

The principles on which I have presumed to offer myself are, I believe, sufficiently made known by a reference to my past public conduct. Those principles remain unchanged; and it is my determination to continue firm in maintaining unimpaired, the institutions, both ecclesiastical and civil, of the country.

Should I receive the mark of confidence to which I now aspire, it would be a high source of satisfaction to me that I might then claim it as a peculiar duty to stand forward in maintaining those rights and privileges of the University which, to the best of my power, it has ever been my study to uphold.

I have the honour to be, Sir, with the greatest respect,
 Very faithfully yours,
 GEORGE BANKES.

THERMO-METALLIC TEETH.

MR. A. JONES, Surgeon-Dentist, 43, New Bond-street, begs to acquaint the Nobility and Gentry, that, from many years' intense application, he has invented and brought to perfection, a New System of Fixing THERMO-METALLIC, NATURAL, and ARTIFICIAL TEETH, from one to a complete set, which are so accurately fitted as not to be distinguished from the original, and answer all the purposes of mastication, articulation, &c.—Mr. A. J. continues stopping decayed teeth with his unrivalled Anodyne Cement, which in one minute allays the most excruciating pain; and by this means carious teeth are wholly preserved and rendered useful, even if broken close to the gums. This being a metallic composition, it becomes hard as enamel in a few minutes, will not decompose with the heat of the stomach, and resists the effects of acids, atmospheric air, &c.—Cleaning, and every operation incidental to Dental Surgery.—At home from ten till five.

London: Printed and Published every Wednesday Morning, by WILLIAM LAW, at the Office, No. 4, Wellington-street, Strand.

MR. BROUGHAM'S EDUCATION BILL.

We gather from some observations which fell from Mr. Brougham in the course of a recent debate, that it is not his intention to renew the Education Bill which he introduced into the House of Commons a few years ago. He expressed himself, however, so doubtfully, evinced so much reluctance to abandon the measure, and assigned so strong a reason for believing that the chances of accomplishing it were greater now than at any former period, that we earnestly hope he will be induced to revise this determination and to alter it.

The most vehement objections to the Bill, when it was first proposed, came from the Dissenters, who were jealous of the influence which it would place in the hands of the Established Clergy. This opposition arose, Mr. Brougham thinks, from the irritable feelings which were produced in the minds of the Dissenters by the operation of the Test Acts, and, this cause of discontent being destroyed, he anticipates a speedy removal of all its consequences. In this hope he may perhaps be too sanguine. The Dissenters, though more attached to the Government than formerly, have not as yet exhibited any alteration of feeling with regard to the Church; and, glad as we should be to witness such a consummation, there seems no immediate chance of it. The repeal of the Test Acts will, we have no doubt, cause many defections from the ranks of the Dissenters; but it is still to be seen whether those who remain among them will not feel their aversion from the Establishment strengthened by that very circumstance. At any rate, the question, therefore, is not, whether the Dissenters will approve of the arrangement which Mr. Brougham proposes, but whether they ought not to approve of it, and whether the Legislature ought not to carry it in defiance of their opposition.

This question turns, we think, altogether upon the previous one, Whether it is expedient that a State should provide its poorer members with education, or whether that duty should be left to the zeal and wisdom of individuals? Let the former point be conceded, and we think we could show without any great difficulty, that the management of the system must in every community be confided to that body of men whom the State recognises as the administrators of its spiritual concerns; and that objections to the principle of that recognition must be general, and cannot affect any special application of it. A parallel instance will explain this. Many persons object to the punishment of death for forgery. But if any of these persons were to rise up in the Legislature, and propose that some offence should be declared a forgery which had not previously been included in that class of crimes, clearly he waives his right, *pro hac vice*, to complain of the existing punishment. He is not estopped at any future time from proposing that it should be abolished for all forgeries, (that one to which he first gave the name among the rest,) but he is most obviously estopped from proposing that, while other forgeries remain obnoxious to this visitation, some different infliction should be specially reserved for this one. He has weighed, no doubt, all the circumstances before he makes his proposition; he has considered whether it is not more advantageous that this particular offence should be referred to its proper head, than it is disadvantageous that, in one additional instance, a punish-

ment, (which may, after all, be changed universally,) should be recognised; he has considered all this, and brings forward his proposition, knowing perfectly the consequences which it must involve.

The same is the case which we are speaking of. The State has made a provision for the spiritual wants of its members. This provision is called a Church Establishment. Whoever professes that the State should make a provision for parochial education, signifies thereby that there is a spiritual want in the people of England, of which the Legislature have not taken cognizance hitherto, and of which they ought to take cognizance. Such a man, then, though he may hereafter say, 'I wish all spiritual concerns were taken out of the control of the Church Establishment,' cannot say of this particular spiritual concern, 'I wish that to be exempt from its control.' He must either propose the abolition of the Church Establishment altogether, or he may object to any further legislative interference with that class of interests, which, by the very constitution of the Church, fall within its jurisdiction, or he must submit to see its influence extended. The first proposition would not find five hundred supporters among educated men, and scarcely a thousand among uneducated men, throughout the country.

Which of the two remaining courses is the most reasonable for an Englishman to adopt, is the subject we shall now discuss.

There is one set of arguers against State provisions for intelligence and morality in general, whose opinions on this occasion we fortunately shall not be required to consider. We mean that class,—which we believe is diminishing every day, and of which, possibly, in a twelvemonth, none may remain alive,—who maintain that the doctrines about supply and demand, and the other principles of political economy, are just as applicable to the moral as to the physical wants of the human species—that morality, religion, and intelligence need not be recognised by the State; because, if they be wanted, people will ask for them; and, if they ask for them, they will get them, &c., &c., &c., &c., &c., &c. Dr. Chalmers, in two admirable little books of his, has put the utterers of these assertions to the proof, and they have not found a word to say for themselves. These assertions had found favour, as many assertions do, simply because, being proposed without evidence, the public take it for granted that they must be first principles; and, as Dr. Chalmers has shown, there is not only not one tittle of evidence in support of this notion, but a mass of evidence quite irresistible in proof of the opposite doctrine.

But, in the present case, we do not require the assistance of this able advocate. The most rabid supporter of a free trade in morals will not take upon him to say that it applies directly to the case of a provision for the poor. We never heard any one contend—though there may be such a person, probably, about the London spouting clubs—that where there is a demand for benevolence, there will necessarily be a supply. Guineas do not come from the 'vast deep' of Mr. Rothschild's pocket merely because they are 'called'; there may possibly be more wanted than are at hand. It may be desirable, or it may not, to provide for the temporal or for the spiritual wants of the poor; but the reason why it is not desirable cannot be, that it is quite certain they will be provided for without it.

Experience, however, it is urged, has demonstrated what previous theory could not,—that individuals will come forward to provide education for their poorer brethren. And, therefore, say one class of the objectors to the scheme, Government, of which the main duty, you will allow, is to provide for men in societies, and not as individuals, must not step out of its province to do what will be done without its help. And, therefore, say another class, since the intermeddling of a state is always a check upon our personal freedom, it ought to withhold its patronage where it is quite clear that we can dispense with it. Both these classes of objectors rely upon one argument: with that argument, turned the other way, we will confute them both.

You say that the business of Government is to provide for man as a social being? You mean, that it is not the business of Government to concern itself with man's individual responsibility, except so far as that affects his situation as a member of the State. We agree with you. The business of a State, so far as individuals are concerned, is to make them good subjects, nothing more. Without a certain education, in the present day, you will allow, there is no security for men being good subjects; and we in our turn will allow, that if there could be a system of education in a country, which perfectly sufficed to make men good subjects, though it were utterly insufficient for every other higher end, the Government would have no business to establish another. The question is, does such an education exist, can it exist, while the care of providing it is entrusted to individuals? What is included in the idea of a good subject? Take it in its narrow sense, as denoting a person who feels that he owes his country a kind and degree of allegiance which he owes no other power to which he is not subjected by the necessary laws of his being,—and what does this imply? Is not the first element of such a dutiful allegiance, a feeling that we are tied and riveted to each other as parts of a nation, in a sense in which we are not tied to one another as members of any corporation whatever? Must not this conviction lie at the root of the character of every good subject and good citizen? And do you say that the education which experience shows us that individuals will confer, is sufficient for this? What! Do you know so little of the education schemes of the present day, that you are not aware whence came nineteen-twentieths of all the schools for the poor that exist in the country? Do you not know, that men establish schools—not because it is a part of their duty as men—not because it is a part of their duty as subjects—but because it is a part of their duty as members of a sect? Do you not know, that the Church in a parish has a school for the poor, because it is right that the Episcopalian should not be behind others in furnishing education; and the Methodists for the same reason, and the Baptists for the same, and all the rest for the same? And, if allegiance to the sect be the motive for establishing a school, allegiance to the sect must, consciously or unconsciously, be the principle inculcated in the school. A person who, when he might have been prompted by either of two motives to the performance of a duty, proclaims that he was swayed by one of them, proclaims, also, that motive to be, in his opinion, the most important, and lays himself under an obligation to press it more than the

other upon the consciences of those whom he guides. If he gives the first fruits of his will to his sect, and the second to his country, he cannot do otherwise than require the same priority of service from those whom he educates. Is this the education, then, which will produce national feeling, to which the state may trust confidently the formation of good subjects?

We turn to the other class of objectors. You think that the highest duty of all,—higher even than that of making good subjects, higher, therefore, than any which the State can ever be bound to discharge,—is the cultivation of each man's individual character, the awakening him to a consciousness and a fulfilment of the responsibilities under which he is laid by his relation to the Supreme Being? We agree with you. And you think, moreover, that if the lower end of making good subjects interfere with the higher end, it ought to be sacrificed? We agree with you. And you think that the State may endanger education by taking it under its care, and thus making it appear that its own highest object is likewise the highest object of Education? We agree with you in this also. We grant that there is a risk of education, when it is undertaken from motives of State wisdom, seeming subservient to these purposes, though it should really aim at others of mightier worth and importance. The question, therefore, with you is this: Is there greater risk of this end being lost sight of when education is undertaken by the State, or when it is left to individuals? We say that the risk is infinitely greater in the latter case, and upon these grounds:

Firstly,—That nearly every individual, from the circumstances of his birth, of his locality, of his profession, of his sect, has generally some particular standard of moral excellence, which is much further below the highest standard of excellence than that which the State proposes. The duty of being a good subject is much more, in quality and kind, like the duties we owe to a Superior Being, than the duties of being a good neighbour, of paying our debts, &c.

Secondly,—The individual who proposes to inculcate his standard of excellence, exercises a direct control over the mode of education: the statesman, though he may believe in his own mind that the obligation of being a good citizen is the greatest of all obligations, does not educate persons into this belief, but, on the contrary, commits the work of education to men whose ordination it is to inculcate the highest motives for this and every other duty.

Thirdly,—Every obligation, except the highest and primary one, which is its own sanction, must be enforced by the sanction belonging to some obligation higher than itself, and may be enforced by the sanction belonging to any obligation which is higher than itself. Consequently, any of the lower duties, such as that of being a good neighbour, may be enforced by the sanction belonging to the obligation of being a good citizen, and there will be no need of referring for that purpose to any higher obligation than this. But, the obligation of being a good citizen being the highest of all the social obligations, and next in rank to our individual obligations, if inculcated as a first duty, must be enforced by aid of the sanction which belongs to those individual duties. Consequently, there is in the nature of things a greater danger, that individuals, who are given to overrate the lower social duties, will neglect to enforce the moral responsibility of the individual, than there is that the State, whose object is to enforce the highest social duty, will. Experience will amply justify and expound all these observations. The education of the present day we have shown to be an Education of Sects. The low social duty of allegiance to the sect is the primary duty enforced, and the sanctions resorted to are not the high sanctions of individual religion, but the low sanctions of a corporate technical religion,—the sanctions of the catechism, not of the Scriptures,—

of fear, not of love. We asked before, is this sectarian education [the way to make good subjects? We ask now, is it the way to make good men?

The conclusion of the whole matter is this. If we want to have the boys of the next generation made into Churchmen, into Dissenters, into Methodists,—into tailors, into shoemakers, into chimney-sweepers, by all means leave the work of educating them to individual conscience. There are enough of persons, we admit, whose zeal for their profession or sect will carry them great lengths, will induce them to make great sacrifices, for the accomplishment of this end. There need be no extraordinary love of enterprise, no very hugely developed organ of Space, in the man who compasses sea and land when the expected reward is that he shall make one proselyte. If the country is to be a vast cauldron, filled with all the elements of confusion and disorder that lie scattered around us, or can be collected from the farthest ends of creation, by all means let each party witch be allowed to try her separate incantation. But if we wish to create a NATION, which ought to differ from a mere corporation in precisely the same way as the soul of an individual differs from his body,—a nation which cannot be created by the mere binding together of parts, naturally unsocial, into a mass, but which must contain a principle of inward spiritual attraction,—a nation, the condition of which, in its perfect form, is, that every member of it should be a distinct person, and yet that there should be no distinction in any of its substance—if this be our end, then the business of education must be undertaken by the State. Individuals are at variance, and we require a system of education that shall be harmonious: individuals adopt schemes framed with a view to the particular district or class in which chance has fixed their habitation, and we want a scheme that shall suit us as Englishmen: individuals devise methods that suit the cravings of the moment, and we want a scheme that will avail for the generation to come. The country requires this; no matter whether the country wishes it or no. If it wish it not, if there be any beggarly objections to the scheme, on the score of the tax which will be needful to bring it into operation, with every rightly thinking politician that should be an additional argument in its favour. If the nation thinks that its moral improvement should be postponed to every other consideration, what an awful proof is this of the necessity for commencing the task of improving it at once! Is education popular?—we are grateful; it is a proof that the mind of Englishmen is desirous of being made wiser: let us gratify the wish. Is it unpopular?—then let not a moment longer be spent than is necessary to give a stable, statesmanlike character to our scheme, before we set it at work to remove the ignorance and the moral perversity, which it is clear, from this opposition, that all our past endeavours have been unable to overturn.

LIFE OF ALEXANDER THE GREAT.

The Life and Actions of Alexander the Great. By the Rev. J. Williams, A. M., Vicar of Lampeter. (The Third Number of the Family Library.) Murray. London, 1829.

THIS is a much better book than any other in English on the same subject. It is a life of a man, except Mahomet, the most remarkable in the history of the world, and therefore deserves (and requires) to be written by a man of genius. Mr. Williams has hardly succeeded in doing this as it ought to be done; but he has done it much better than any of his predecessors.

We say that Alexander is the most remarkable person in history except Mahomet;* and for

* We fear we should be accused of irreverence, if we were also to except Jesus Christ; yet of whose life have the mere worldly results been half so mighty?

these reasons. History is a succession of vast movements, by which one set of thoughts and state of circumstances is substituted for another. The instrument of almost all these changes has been conquest. There can be little doubt that all the great empires of the East were founded as legal polities by successful armies, though, in general, no direct evidence of the fact has come down to us. In Greece itself, we know how important a power were the arms of colonising strangers. Conquest was the pillar of the Roman State, the very air it breathed; and by it the great mistress of war and law impressed her own character on half the nations. The two most important and seminal of the world's later revolutions are the subjugation of a part of Europe, Asia, and Africa, by Mahometanism, and that of Rome's European Empire, by the Teutonic tribes. These have been the moulds in which human society has been formed to its present shape. We cannot look for a moment at the world without meeting, as the most singular and prominent circumstance, the religion of the great Arabian. Nor is there one of the objects which surround us, or scarcely a word we speak, a thought of our hearts, which would not have been other than it is, but for the arms of the warriors who were led by Clovis, Theodoric, and Hengist.

Now of these immense and awful changes in the affairs of men, we know but of two, (excluding Christianity,) the whole means and ultimate scope of each of which were originally present to a single wonderful mind. These two are the laws, institutions, and powers of the Mahometan nations, and the Asiatic conquests of Alexander. Our literature contains no work in which either of these great revolutions is treated as it ought to be; and we much regret that the one selected by Mr. Williams should be so inadequately handled.

This book, nevertheless, contains a far clearer, more lively, more reasonable, more learned, and even more thoughtful, account of the Macedonian's character and life, than any other in English. We understand better, after reading it, what kind of person he was, what he did, and how he did it. There are two short chapters by Montequieu worth all that Mr. Williams has thought on the subject. But we have, perhaps, no right to complain that a learned and able man is not a man of genius. It is curious, however, to see the narrowness of speculation display itself almost wherever there was much room for the contrary even from the beginning of the Preface, the first paragraph of which is as follows:

'The following work is chiefly intended for youthful readers, who may feel a wish to trace the extraordinary progress of Alexander, with due attention to geography and chronology. The study of history unconnected with these two branches of knowledge, is mere trifling, and may be beneficially superseded by the historical romance. But as there is something more wholesome and invigorating to the mind, in the naked perception of truth, than in all the glowing colours of fancy, I trust that the following narrative may, in some degree, attract the attention of the mere English reader.'

Now we would ask Mr. Williams, whether there be no 'truth,' the 'perception' of which is 'wholesome and invigorating to the mind,' except that of 'geography and chronology.' Can we learn nothing of human nature, nothing of political society, nothing of the thoughts and characters of men, from Livy, for instance, or Froissart, whose geography and chronology are, for the most part, inaccurate; or from Tacitus, (whom Mr. Williams has the sense and taste to admire,) in whom there are qualities of such infinitely higher value than accuracy in 'chronology and geography,' (important as they are,) that it scarcely occurs to us, except in merely critical moments, to consider whether he knew any thing about them at all.

Again, let us look at the character of Aristotle, drawn by Mr. Williams:

'The mental stores of Aristotle were vast, and all arranged with admirable accuracy and judgment. His style of speaking and writing pure, clear, and precise;

and his industry in accumulating particular facts, only equalled by his sagacity in drawing general inferences.—P. 12.

This is all. And might it not be applied with as much precision and characteristic force to almost any other eminent thinker, from Plato down to Hume? In what Aristotle differed from all other men, is the point in question; just as another point in question is the distinction between Alexander and the rest of great mankind. The latter, Mr. Williams has in a degree settled; of the former, he seems to know no more than a child. Yet, on the whole, the chapter on the education of Alexander is curious and valuable. We have much pleasure in extracting it; and our readers will thereby see, that, though we have ventured to find fault with Mr. Williams, he is a writer for whom it is impossible not to feel respect:

‘Alexander, the third King of Macedonia of that name, and commonly surnamed the Great, was born at Pella three hundred and fifty-six years before Christ. His father Philip traced his origin through Temenus, the first Heracleid King of Argos, to Hercules and Perseus. The family of his mother Olympias was no less illustrious; for the royal race of Epirus claimed to be lineally descended from Neoptolemus, Achilles, and Peleus. As he could thus refer his origin to Jupiter by the three different lines of Perseus, Hercules, and Peleus, it is impossible for us in the present day to calculate the impression made on his youthful mind by so illustrious a descent. It is certain, however, that, from his earliest days, he proposed to himself to rival, and, if possible, surpass the renown of his ancestors.

‘Philip received the news of the birth of his son immediately after the capture of the city of Potidæa, the peninsular situation of which had enabled it long to resist the Macedonian arms. On the same day he received intelligence of a victory gained by Parmenio over the Illyrians, and of the success of his horses in bearing away the first prize at the Olympic games. In after times the Asiatics remarked, with superstitious awe, that the magnificent temple of Diana at Ephesus had been destroyed by fire on the night of Alexander's birth, and that the general conflagration of Asia had been typified thus early by the destruction of its most splendid ornament. Perhaps it ought to be remarked, as a proof of the eager and restless spirit of the times, that the incendiary, who ought to have remained nameless, was willing to purchase deathless notoriety at the expense of his life, and preferred an infamous death to an unrecorded life. Such a state of morbid feeling could be produced only in times of great and common excitement.

‘Nothing certain is known respecting the infancy and childhood of Alexander. The letter which Philip is supposed to have written to Aristotle on the birth of the Prince, is, I fear, a forgery. For it is rather incompatible with the fact, that Aristotle did not take the immediate charge of his duties until his pupil had attained his fifteenth year. But as the philosopher's father had been the favourite physician in the Macedonian court, it is not unlikely that even the earlier years of the Prince were under the superintendence of his great preceptor, and that his primary education was conducted according to his suggestions. If such was the case, we can easily deduce the principles on which both the earlier and more mature education of Alexander was conducted, from Aristotle's Treatise on Politics, where they are developed.

‘He divides a regular course of education into three parts. The first comprises the period from the birth to the completion of the seventh year. The second from the commencement of the eighth to the completion of the eighteenth year, and the third from the eighteenth to the twenty-first.

‘According to Aristotle, more care should be taken of the body than of the mind for the first seven years: strict attention to diet be enforced, and the infant from his infancy habituated to bear cold. This habit is attainable either by cold bathing or light clothing. The eye and ear of the child should be most watchfully and severely guarded against contamination of every kind, and unrestrained communication with servants be strictly prevented. Even his amusements should be under due regulation, and rendered as interesting and intellectual as possible.

‘It must always remain doubtful, how far Olympias would allow such excellent precepts to be put in execution. But it is recorded that Leonnatus, the governor of the young prince, was an austere man, of great

severity of manner, and not likely to relax any adopted rules. He was also a relation of Olympias, and as such might doubtless enforce a system upon which no stranger would be allowed to act. The great strength, agility, and hardy habits of Alexander, are the best proofs that this part of his education was not neglected, and his lasting affection for his noble nurse Laniæ, the daughter of Dropidas, proves also that it was conducted with gentleness and affection.

‘The intellectual education of Alexander would, on Aristotle's plan, commence with his eighth year. About this period of his life, Lysimachus, an Acarnanian, was appointed his preceptor. Plutarch gives him an unfavourable character, and insinuates that he was more desirous to ingratiate himself with the royal family, than effectually to discharge the duties of his office. It was his delight to call Philip, Peleus; Alexander, Achilles; and to claim for himself the honorary name of Phoenix. Early impressions are the strongest, and even the pedantic allusions of the Acarnanian might render the young prince more eager to imitate his Homeric model.

‘Aristotle mentions four principal branches of education as belonging to the first part of the middle period. These are literature, gymnastics, music, and painting, of which writing formed a subordinate branch. As the treatise on politics was left in an unfinished state, we have no means of defining what was comprehended under his general term literature, but commencing with reading and the principles of grammar, it apparently included composition in verse and prose, and the study of the historians and poets of Greece. During this period the lighter gymnastics alone were to be introduced, and especially such exercises as are best calculated to promote gracefulness of manner and personal activity. Aristotle had strong objections to the more violent exertions of the gymnasium during early life, as he considered them injurious to the growth of the body, and to the future strength of the adult. In proof of this, he adduces the conclusive fact, that in the long list of Olympic victors, only two, or at most, three instances had occurred in which the same person had proved victor in youth and in manhood. Premature training and over-exertion he, therefore, regarded as injurious to the constitution.

‘Not only the theory of painting, but also a certain skill in handling the pencil, was to be acquired. Aristotle regarded this elegant art as peculiarly conducing to create a habit of order and arrangement, and to impress the mind with a feeling of the beautiful.

‘Music, both in theory and practice, vocal and instrumental, was considered by him as a necessary part of education, on account of the soothing and purifying effects of simple melodies, and because men, wearied with more serious pursuits, require an elegant and innocent recreation. By way of illustration, he adds, that music is to the man what the rattle is to the child. Such were the studies that occupied the attention of the youthful Alexander, between the seventh and fourteenth year of his age. When he was in his eleventh year, Demosthenes, Æschines, and eight other leading Athenians, visited his father's court as ambassadors, and Philip was so proud of the proficiency of his son, that he ventured to exhibit him before these arbiters of taste. The young prince gave specimens of his skill in playing on the harp, in declamation, and in reciting a dramatic dialogue with one of his youthful companions. But if we can believe Æschines, Demosthenes was particularly severe on the false accents and Dorian intonations of the noble boy.

‘In his fifteenth year he was placed under the immediate tuition of the great philosopher, according to whose advice I have supposed his earlier education to have been conducted. In the year B.C. 342, Aristotle joined his illustrious pupil, and did not finally quit him until he passed over into Asia.

‘The master was worthy of his pupil, and the pupil of his master. The mental stores of Aristotle were vast, and all arranged with admirable accuracy and judgment. His style of speaking and writing pure, clear, and precise; and his industry in accumulating particular facts, only equalled by his sagacity in drawing general inferences. Alexander was gifted with great quickness of apprehension, an insatiable desire of knowledge, and an ambition not to be satisfied with the second place in any pursuit.

Such a pupil, under such a master, must soon have acquired a sufficient knowledge of those branches described before, as occupying the middle period of education. He would then enter on the final course intended for the completion of his literary studies. This comprehended what Aristotle calls *Mathesias*, and included the branches of human learning arranged at

present under the general term mathematics. To these, as far as they could be scientifically treated, were added moral philosophy, logic, rhetoric, the art of poetry, the theory of political government, and the more evident principles of natural philosophy. On these subjects we still possess treatises written by Aristotle, in the first place most probably for the use of his pupil, and afterwards published for the public benefit.

‘We learn also from a letter of Alexander, preserved by Plutarch, that Aristotle had initiated his pupil in those deep and mysterious speculations of Grecian philosophy, which treated of the nature of the Deity, of the human soul, of the eternity and other qualities of matter, and of other topics which prudential reasons prevented the philosopher from publicly explaining. As the letter gives a lively idea of the exclusive ambition of Alexander, I here insert it. It was occasioned by the publication of Aristotle's treatise on that branch of knowledge, called from that very book *Metaphysics*.

“ALEXANDER TO ARISTOTLE, HEALTH.

“You did wrong in publishing those branches of science hitherto not to be acquired except from oral instruction. In what shall I excel others if the more profound knowledge I gained from you be communicated to all. For my part I had rather surpass the majority of mankind in the sublimer branches of learning than in extent of power and dominion.—Farewell!”

‘But the great object of Aristotle was to render his pupil an accomplished statesman, and to qualify him to govern with wisdom, firmness, and justice, the great empire destined to be inherited and acquired by him. It was his province to impress deeply upon his mind the truths of moral philosophy, to habituate him to practise its precepts, to store his mind with historical facts, to teach him how to draw useful inferences from them, and to explain the means best calculated to promote the improvement and increase the stability of empires.

‘It is difficult to say what were the religious opinions inculcated by Aristotle on his pupil's mind. In their effects they were decided and tolerant. We may therefore conclude that they were the same as are expressed by Aristotle, who maintained the universality of the Deity, and the manifestation of his power and will under various forms in various countries.

‘As in modern, so in ancient times, great differences of opinion prevailed on the subject of education. Some directed their attention principally to the conduct of the intellect, others to the formation of moral feelings and habits, and a third party appeared more anxious to improve the carriage and strengthen the body by healthful exercise than to enlighten the mind. Aristotle's plan was to unite the three systems, and to make them co-operate in the formation of the perfect character, called in Greek, the beautiful and good. In truth, no talents can compensate for the want of moral worth; and good intentions, separated from talents, often inflict the deepest injuries, while their possessor wishes to confer the greatest benefits on mankind. Nor can it be doubted, that a sound constitution, elegance of manner, and gracefulness of person, are most useful auxiliaries in carrying into effect measures emanating from virtuous principles, and conducted by superior talents.

‘It is not to be supposed that Aristotle wished to instruct his pupil deeply in all the above-mentioned branches of education. He expressly states that the liberally educated man, or the perfect gentleman, should not be profoundly scientific, because a course of general knowledge, and what we call polite literature, is more beneficial to the mind than a complete proficiency in one or more sciences; a proficiency not to be acquired without a disproportionate sacrifice of time and labour.

‘It was also one of Aristotle's maxims that the education should vary according to the destination of the pupil in future life; that is, supposing him to be a gentleman, whether he was to devote himself to a life of action, or of contemplation. Whether he was to engage in the busy scenes of the world, and plunge amidst the contentions and struggles of political warfare, or to live apart from active life in philosophic enjoyments and contemplative retirement. Although the philosopher gave the preference to the latter mode of living, he well knew that his pupil must be prepared for the former; for the throne of Macedonia could not be retained by a monarch devoted to elegant ease, literary pursuits, and refined enjoyments. The successor of Philip ought to possess the power of reasoning accurately, acting decisively, and expressing his ideas with perspicuity, elegance, and energy.

'I have mentioned these particulars because it would be difficult to form just conceptions of the character of Alexander without taking into consideration, not only the great advantages enjoyed by him in early youth, but also the recorded fact that he availed himself of these advantages to the utmost. Amidst his various studies, however, Homer was the god of his idolatry; the Iliad, the object of his enthusiastic admiration. The poet, as Aristotle emphatically names him, was his inseparable companion: from him he drew his maxims; from him he borrowed his models. The preceptor partook in this point of the enthusiasm of his pupil, and the most accurate copy of the great poem was prepared by Aristotle, and placed by Alexander in the most precious casket which he found among the spoils of Darius.

'Eager as Alexander was in the pursuit of knowledge, it must not be supposed that Philip would allow his successor to form the habits of a recluse; on the contrary, he early initiated him in the duties of his high station. At the age of sixteen he was appointed Regent of Macedonia, while his father was detained at the siege of Byzantium, and on a prior occasion astonished some Persian deputies by the pertinency of his questions, and the acuteness of his intellect. His studies were diversified even by the toils of war, and in his eighteenth year he commanded the left wing of the army at the celebrated battle of Chæroneia, and defeated the Thebans before Philip had been equally successful against the Athenians.

'In the following year Philip destroyed the peace of his family by marrying Cleopatra, the niece of Attalus, one of his generals, and by disgracing, if not divorcing, Olympias. Philip had married many wives, but they were the sisters or daughters of Thracian, Illyrian, and Thessalian chiefs, and probably not entitled to the honours of sovereignty. But his marriage with a Macedonian lady of high rank and powerful connection could only tend to a formal rupture with Olympias. To widen the breach, Philip changed his bride's name from Cleopatra to Eurydice, his mother's name. That this was done by way of declaring her the legitimate queen, may be inferred from the fact, that when a princess called Adea married Arideus, Alexander's successor, her name also was changed into Eurydice. The natural consequence was, that Alexander became suspicious of his father's intention about the succession, and a misunderstanding took place, which ended in the flight or banishment of several of the prince's most intimate friends, and in his own retirement with his mother into her native country. Subsequently a reconciliation took place, and Olympias and the prince returned into Macedonia. Alexander, the reigning king of Epirus, and the brother of Olympias, accompanied them, and the re-union was celebrated by his marriage with Cleopatra, the daughter of Philip. During the festivities attendant on the nuptials, Philip was assassinated by Pausanias, one of the great officers of his guards. As this event led some writers to question the fair fame of Alexander, it will be necessary, in order perfectly to understand the subject, briefly to glance at the previous history of the Macedonian monarchy.—Pp. 7—17.

At page 295 we find a passage which illustrates our previous assertion as to the inadequacy of Mr. Williams's attempts at speculation:

'It is a melancholy consideration, that hitherto on this globe a high degree of civilisation has first destroyed national feelings or patriotism, then national independence, as the inevitable consequence, and, finally, national existence. The Chaldean and Assyrian have been swept from the face of the earth; the descendants of the Medes and Persians are outcasts from their country; a few Copts represent the ancient Egyptians; the Greek is the barbarian slave of a barbarian tyrant; and Italy, with her double wreath, with her two eras of light and liberty, is partly enslaved and partly barbarised. Thus, also, the Hindoos have, for centuries, been the prey of more warlike tribes, who have fought and bled for the sovereignty of that great peninsula, while the inhabitants have remained passive spectators of the contest, as if a change of masters was to them a matter of indifference. China alone has escaped the common fate, not so much from its admirable constitution, as from its great population, and exclusion from the rest of the world—two circumstances that have enabled it twice to absorb its bandit conquerors, without any material change in the nature of the institutions and of the people.'

Now we should wish to know whether this author really thinks that we cannot become or remain patriotic without giving up our civilisation? Are we to look for the regeneration of all countries

by carrying on their civilisation, which has never been mischievous except when partial and ill-directed, till they become full of national spirit, and thereby strong and virtuous? or are we to bid the world go back till it shall have reduced itself to a desert, possessed by savages as degraded as those of New Holland. Putting little faith in these vague and obsolete lamentations about the evils of civilised life, we dare maintain that the Chinese is more patriotic than the native of Otaheite, and that the Prussian is animated by a far deeper and nobler national spirit than the native of China. In the name of all the young, for whom Mr. Williams designs his book, we entreat him carefully to exclude from any subsequent edition all the crude speculations of this kind; remembering that the sense of the work-day man is far more useful, far more respectable, far wiser, than the subtlest conclusions of a perverted sophistical philosophy.

We will only add an extract which displays the activity of Alexander's mind in the last year of his life:

'Numerous embassies from Grecian states waited the King's arrival at Babylon; they were all complimentary, and received due honours. To them was entrusted the care of the trophies which Xerxes had carried away from Greece, and which the King ordered to be reconveyed to the several cities whence they had been removed. Athenæus has quoted a passage from Phylarchus descriptive of the appearance of Alexander's court on public days, which, in the absence of better authority, I introduce here.

'The golden plane trees, the vine of pure gold loaded with clusters of emeralds, Indian carbuncles, and other invaluable gems, under which the kings of Persia used to sit and give audience, were not equal in value to the sum of Alexander's expenses for one day. His tent contained a hundred couches, and was supported by eight columns of solid gold. Over head was stretched cloth of gold wrought with various devices, and expanded so as to cover the whole ceiling. Within, in a semi-circle, stood five hundred Persians, bearing lances adorned with pomegranates. Their dress was purple and orange. Next to these were drawn up a thousand archers, partly clothed in flame-coloured and partly in scarlet dresses. Many of these wore azure-coloured sashes. In front of these were arranged five hundred Macedonian Argyraspides. In the middle of the tent was placed a golden throne, on which Alexander sat and gave audience, while the great officers of the guard stood behind and on either side of him. The tent on the outside was encircled by the elephants drawn up in order, and by a thousand Macedonians in their native dress. Beyond these were arranged the Persian guard of ten thousand men, and the five hundred courtiers allowed to wear purple robes. But out of this crowd of friends and attendants, no one dared to approach near to Alexander, so great was the majesty with which he was surrounded.'

'But neither the homage of suppliant nations nor the pomp and magnificence of his court, could divert the active mind of Alexander from useful projects. He sent Argæus with a band of shipwrights to the shores of the Caspian Sea with orders to cut timber in the Hyrcanian forests, and to build ships on the plan of the Grecian war vessels. For he was anxious to discover with what sea the Caspian communicated. The Greek philosophers reasoning from analogy, had not given credit to Herodotus concerning its alleged isolation. Nor was their scepticism blameable. Herodotus wrote only from report; and as his account of the rivers that flow into that sea is grossly erroneous, his accuracy respecting the sea itself can be regarded only as casual. The narrow outlets that connect the Mæotic with the Propontis, the Propontis with the Euxine, the Euxine with the Mediterranean, and the Mediterranean with the Atlantic, had prepared them to expect a similar outlet in the Caspian. They would not, therefore, without a careful investigation of every creek on its coast, allow the anomaly of an inland sea that did not communicate with the circumambient ocean. Alexander did not live to hear of the success of his plans, but Seleucus carried them into execution, and a fleet under his admiral, Patrocles, was employed to survey carefully the shores of the Caspian. The dangers attendant on the navigation of that rude and boisterous basin seem, however, to have been too great for the courage of Patrocles. His pretended discoveries of the mouths of the Oxus and Jaxartes, and of a south-east passage into the Indian Ocean, are

proofs that he never in reality fulfilled his commission, nor examined the shores. Had Alexander himself lived, the veil of darkness that enveloped those regions for thirteen centuries longer would probably have been removed.

'The Indian fleet, under Nearchus, had sailed from the great estuary, up the Euphrates to Babylon. Alexander, on his return to Ecbatana, found it there, as well as two quinqueremes, four quadriremes, twelve triremes, and thirty triacometers, which had arrived from the Mediterranean. The vessels had been taken to pieces on the Phœnician coast, carried by land to Thapsacus, re-constructed there, and navigated down the Euphrates to Babylon. There he ordered a harbour large enough to accommodate a thousand ships of war, to be excavated on the banks of the Euphrates, and covered docks in proportion to be constructed. Sailors from all parts of the Mediterranean hurried to man his fleet; among these the fishermen of the murex or purple-fish, on the Phœnician coast, are particularly mentioned. Agents were sent to engage the most skilful seamen, and to purchase the ablest rowers for his service. In a word, it was his intention to form on the Susian and Babylonian coast, a second Phœnicia—equal in wealth and population to the Syrian.

'He had fixed upon Babylon for the seat of empire, as the central spot between Egypt and the Mediterranean on one side, and the Indus and Eastern Ocean on the other. The fertility of Assyria was boundless, and its revenues, in the time of Herodotus, formed a third of the annual receipts of the Persian kings. But these had neglected the interests of Assyria, and the ruined cities on the banks of the Tigris, described by Xenophon, attest the extent of desolation. It was Alexander's policy to heal the wounds inflicted by them, and to restore Assyria to her ancient supremacy. But before this could be done effectually, and unrestrained communication opened between the provinces of the south-western empire, it was necessary to reduce the Arabs to subjection. Their position to the west of Babylonia made incursions into the province easy, and their command of the course of the Euphrates enabled them to exact ruinous sums from the merchants navigating that river. His plan for their subjugation was for the fleet to circumnavigate the Arabian peninsula, and its motions to be attended by a landed force. Thirty oared galleys were sent successively to examine the southern shores of the Persian Gulf, and to report the state of the Arabian coast. Hiero, a sea captain from Soli, ventured furthest. His orders had been to sail round into the Red Sea, until he arrived in the vicinity of the Egyptian Heropolis. But when he had coasted along the whole extent of the shore within the gulf, and doubled the formidable cape now called Ras Musendoon, his heart also failed him, and he ventured to announce to Alexander the greatness of the undertaking.

'But difficulties only stimulated him, and the preparations for the departure of the great expedition were carried on without any cessation. Had it set out under the command of the King, the probability is that it would have proved successful. The Arabs were not formidable in the field; and an active land force, supported by a large fleet, might, without enduring much hardship or opposition, have made the circuit of the peninsula. The fertile spots between Muscat and Mocha, and Mocha and Mecca, are numerous enough to furnish ample provision for an invading army; and from Mecca he could easily have transferred his troops to the Egyptian shore, where the resources of the valley of the Nile were at his command.

'Ælius Gallus, who invaded Arabia under the auspices of Augustus, found no resistance from the natives, and during an eight months' campaign lost only seven soldiers by the enemy's weapons. Nor is the boasted invincibility of the Arabs founded in truth. Sha-Poor, or Sapor, one of the greatest monarchs of the Persian dynasty of Sassan, marched victoriously from Hira, on the western frontier of Babylonia, to Gathreb or Medina, on the Arabian Gulf; and the great Nushirwan completed the conquest of Arabia, and compelled every sheik and saladin within the peninsula to acknowledge him as their head. It cannot therefore be supposed that Alexander's activity, forethought, and prudence, in proportioning the means to the end, could, in the common course of calculation, have failed. Probably, also, as the expedition was to partake of the character of a voyage of discovery as well as of conquest, the sheiks would have soon discovered that resistance would only irritate, and cause the conqueror to delay his course and exterminate, while a ready submission would save the inhabitants from all molestation, save the transmission through their territories of the travelling force.

'While the preparations were still continued, the King turned his attention to the canals and irrigation of Assyria. To the west or south-west of Babylon was a long succession of large cavities or depressions in the soil, into which the superfluous waters of the Euphrates could be turned in the season of the floods. These cavities were supposed to have been the works of former Assyrian kings, and were equal in extent to an inland sea. The canal, which connected the Euphrates with these reservoirs, was called the Pallacopas; its upper end being in the right bank of the great river, about thirty-six miles above Babylon. The entrance into the Pallacopas was opened during the floods, in order to relieve the banks near and below Babylon from part of the pressure of the waters; but when the floods subsided, it was necessary again to obstruct the entrance, and to prevent the water in its fertilizing state from escaping into the lakes. It was easy to cut the bank, and admit the flood waters into the Pallacopas, and thence into the great basins; but it was a Herculean task to repair the breach, and compel the Euphrates to resume its ordinary channel. The satrap of Assyria had every year to employ 10,000 men, for three months, in the work of obstruction. Alexander sailed up the Euphrates, and examining the mouth of the Pallacopas, found it impossible to remedy the evil at the point where the cut was annually made, as the whole soil in the vicinity was gravelly and alluvial, and almost defied the task of obstruction; but on examining the bank higher up the stream, he found, about four miles from the ancient place, a spot where the bank below the surface was rocky. Here he ordered a new channel to be excavated, which might, with comparative ease, be obstructed in the proper season.'—Pp. 381—387.

PHENOMENA OF THE HUMAN MIND.

Analysis of the Phenomena of the Human Mind. By James Mill, Esq., Author of the 'History of British India,' and 'Elements of Political Economy.' In 2 vols. 8vo. Baldwin and Cradock. London, 1829.

THOSE suffrages which ultimately fix the just height of philosophical reputations have, at least in this country, been awarded with scarce less regard to the language and apparent mental temperament than to the genius and the learning of its claimants. Moral essayists may recommend the popular forms of virtue with the warmest colours of style their common-place book can afford,—preachers may bring airs from heaven, or blasts from hell, to animate their appeals to the alarmed or languishing piety of their audience; but those who are more commonly distinguished as philosophers—those the field of whose research is the foundation of science, the source and origin of moral distinctions—are expected to subdue their fancy and feeling in the conduct of their main design: and nothing, perhaps, would be more fatal to the character of a system than the predominance of those very qualifications most required in the discovery and collection of its elements. The most illustrious example of a great genius, trained and bridled to the most strict prosaic temperance of manner and style, has been afforded by the founder of our modern philosophy; and, if there is any thing more striking than his powerful yet delicate grasp of all that imagery or language could contribute to his purpose, it is the resolute curb maintained on his own copiousness,—the wilful neglect to draw on his unexhausted stores for novel illustration, when some familiar or already used comparison would suffice him,—the resolute self-denial, or denial, rather, of license to those vagrant and seductive propensities and tricks of false eloquence, obscure or artificial elevation, whereby that great self would have been spoiled of its symmetry. He said, that 'the very styles and forms of utterance of men were so many characters of imposture, some choosing a style of pugnacity and contention, some of satire and reprehension, some of plausible and tempting similitudes and examples, some of great words and high discourse, some of short and dark sentences, some of exactness of method, ALL OF POSITIVE AFFIRMATION; without disclosing the true motives and proofs of their opinions, or free confessing their ignorance or doubts, except it be

now and then for a grace, and in cunning to win the more credit in the rest, and not in good faith.*' And this censure of the various modes of language in others involved the self-approval, however unconscious, of his own.

The same sobriety of tone which has conciliated submission to the intellectual empire of Bacon, may be suspected to have been still more influential in substantiating the title to an all but equal eminence in the person of him who pursued into the province of mind a similar enterprise to that which his great master, urged by 'ill-matched ambition,' left unfinished in the field of physical science. Those who do not celebrate the genius of Locke with fiercer ardour than assorts with the calm spirit they apotheosise, will confess that the great charm of his work is the clearness of exposition with which he has given the results of a deliberate unimpassioned survey, combined with that which is a surer indication of a truly philosophical spirit, than any outward characters of style can furnish—the determination, ever avowed and acted on, to recall investigation from abstractions to realities.

But this measure and sedateness of expressions which, in Bacon, is enforced upon the vigour of an ever-active mind and teeming fancy, in Locke appears the only medium of communication suitable to the quality and structure of his thoughts. The style of Bacon is studiously levelled and familiarised when the abstruseness of his topics requires facilities for apprehension: the style of Locke naturally runs on a level, and is familiar, as it seldom needs to deviate from the common-place experience of others. We consult him as an accurate observer of the ordinary phenomena of thought and speech, and as a cool and acute expositor of the ordinary fallacies which infest the daily exercise and use of both. But we rarely, if ever, find in him a clear and rapid insight into the more mysterious processes of either—still less are we constrained to feel and acknowledge that extended intellectual mastery embracing alike the nearest and the most remote objects, which to mental leaders alone can secure the allegiance of their followers. We admire the shrewd contemplator of the human understanding, who, having well observed the functions and operations of the moral frame in its full size and maturity, can then show us in its infantine and nascent state the parts which, in its future growth, are to swell with yet unawakened powers and capacities. But the question will suggest itself, Could the moral constitution which, having first been seen in maturity, seems thus easily reduced into its primary and original elements, have been anticipated merely from such data as its earliest sensations will furnish? Is there not, as it were, a new element of being introduced at every succeeding epoch of physical and moral existence? Are these likely to be detected in their real strength and subtlety by any cold and formal process of analysis, or are there not mental characters traced, as it were, in sympathetic ink, needing warmth as well as light to be legible? The plain and somewhat prolix monotony of Locke may bear much of the appearance, nay, reality, of sober and sincere investigation; but can never with impunity stray out of those subjects to which a dry, unwieldy style appears to many the most appropriate. An example of this is the comparative neglect under which the bulk of Locke's writings labour; and how fortunate soever his political treatises in the crisis of their first appearance, it will now be confessed, that they cannot bear a moment's comparison with the similar speculations of Hooker or Bolingbroke.

We detain our readers too long from the work of Mr. Mill; but we must still entreat their patience till we notice a particular of some importance to the estimate they may form of its contents. This is the analogy so often said to exist between the processes of physical and metaphysical science;

and in stating which, an eminent author, whom Mr. Mill appears to agree with in this, as in several other instances, appears to us to have run into a paradox very hurtful to the soundness of his views on either branch of inquiry. 'There can be no question,' says Dr. Brown, ('Philosophy of the Human Mind,' vol. i., p. 94,) 'as to the nature of that unity which we ascribe to bodies. We have seen that the substance, which, in thought, we regard as one, is, in truth, not one but many substances, to which our *thought* alone gives unity, and that all inquiry, therefore, with respect to the nature of a substance, as it exists in space, is an inquiry into the nature of those separate bodies that occupy the space which we assign to the *imaginary aggregate*.'

We can easily conceive an uninitiated auditor or reader of philosophy like this, after surmounting the first shock of disenchantment from these *imaginary aggregates*, to which *thought* alone gives unity, rather gratified than otherwise by the feeling of his novel metaphysic emancipation. There must, moreover, be a proud satisfaction in according to the cabbages and donkeys around him the privilege of appearing in his presence, as well in an individual as a collective capacity, and in magnanimously resolving to swallow cabbage and drub donkeys, as other people do who know no better; thus giving these respectable quadrupeds and vegetables an unity in his conception they would not otherwise be entitled to. But if the words of Lord Bacon be correct, which Dr. Brown himself cites as his 'great primary aphorism,'—*Homo, naturæ minister et interpretes, tantum facit et intelligit, quantum de naturæ ordine re vel mente observaverit; nec amplius scit aut potest*,—we should be glad to know on what pretence of chemical discovery those elements, into which material substances may be resolved, should be regarded as separate, independent, &c., while the same title is denied to the aggregates composed of them. We have exactly the same evidence, that of the senses, for attributing unity to these as to any of their elements. They affect us with sensations different from those which are excited by their elements, regarded either singly or one after the other in succession, or (in many cases) even in juxtaposition; at least, in any meaning we attach to the term.

The bearing of these remarks upon the science of mind, and their especial reference to the work which is at present before us, will be shown in a future number.

RYBRENT DE CRUCE.

Rybrant de Cruce. 3 vols., post 8vo. Colburn. London, 1829.

THIS novel has a kind of merit very rare in our days of hasty writing—excellence, namely, of plot. The story is so constructed as to contain nothing which does not assist the general design, and to want nothing without which that design would be imperfect. The catastrophe is in no degree forced, and yet it ends a great difficulty, and disposes satisfactorily of all the characters introduced in the course of the work. To accomplish this, required much both of labour and talent. It was to bring the powers of the author into comparison with one of the most prominent and popular merits of Fielding. In other respects, the book, though not of first-rate value, is pleasant and able.

The evil of that kind of composition in which the interest turns almost entirely on the skillful arrangement of the story, is this, that when once the secret is discovered, the mechanism laid open, the mystery solved, we can no longer care about the subject. Our curiosity is satisfied; and, unless there be other excellences which will bear to be dwelled on, we throw aside the book for ever. We fear that this will be the case with 'Rybrant de Cruce.' Yet, that we may prove it not to be destitute of other good qualities besides that

* 'Interpret. of Nat,' c. xviii.

which chiefly we have ascribed to it, we will quote, from the third volume, a passage distinguished by clear and spirited writing :

'The sun was rising in the clear brilliancy of an October morning, behind the — hills; there had been some showers in the night, and the topmost branches of the trees, which, in many places, fringe those eminences to their summits, were beaded with large diamond drops that hung quivering and glittering in the sunshine, while the wood below yet lay deep in shade. Several narrow lines of white vapour marked the windings of various streamlets, which else had lain hid, each in its deep and shady bed. At first, these slender mists stretched their well-defined and unbroken length like silver girdles athwart the woods below; but, as the air received the sun's increasing warmth, the cold and still precision of their forms began to yield; the sides curled off in fleecy wreaths, which clung awhile in detached masses upon the trees, and then gradually melted away. The short turf on the summit of the hills was overspread in gentle shade by a fairy network, which it seemed impious for human foot to disturb; while the shining threads not only crossed each other in thick patches on the grass, but even stretched their bright and tangled web over the tall heath and furze which rose in tufts around. The air was fresh and exhilarating, and a young sportsman, who, with his dog and gun, had climbed a rough and difficult ascent, stood contemplating, with pleasure and surprise, the singularly wild and solitary scene which suddenly lay beneath his feet.

'Though his dress and accoutrements denoted the chase, while the ruddy health on his cheek, and the bright glance of his dark eye, appeared to denote a heart open to its enjoyments; yet so deeply had his thoughts till now been engrossed by some secret but overpowering influence, that the hills he had already crossed, the freshness of the air, and all the varied charms of nature, had hitherto remained entirely unnoticed.

'It is true, a gun rested on his shoulder, and, as he plunged down each dark gully, pushed vigorously through the tangled thicket on its side, forded or leaped the water at its foot, or climbed, with an activity which seemed to want no rest, the opposite, and sometimes perpendicular, ascent, a casual observer, who crossed his path, might easily have imagined that his pursuit was as earnest as his step was free, and that the joy which beamed in his open and manly countenance was but the reflection of the beauty that on all sides smiled around him. But the only eye that watched his progress was that of a much more accurate and experienced judge: and greatly was poor Rover dismayed, and wistfully did he look in his master's face for some solution of the strange enigmas, when, after bounding joyfully over brake and bush, splashing and wading through each shallow pool, or wheeling at his utmost speed round the open turf on the heights they had already traversed, he returned with eager diligence to draw his patron's attention to the game he repeatedly started, and found him plodding resolutely on in some contrary direction, utterly insensible to all the hints and signals he was wont so readily to understand, and equally regardless of the clamorous remonstrances which, issuing in short and shrill barks, showed at length that Rover's patience was entirely exhausted.

'It is difficult to say how long this state of things might have continued; but at last, in consequence of some pause in the young sportsman's cogitations, or from the singular aspect of the scene, its wildness and novelty that forced themselves upon his attention, on reaching the summit of the steep ridge he had just mounted, he stopped short for the first time that morning, and, breaking from the reverie which had till then made hill or dale appear alike to him, surveyed with interest and curiosity the deep glen beneath. "This is a strange and lonely spot indeed!" he murmured to himself; while his attention being thus roused, he now traced the singular features of the deep and narrow dell whose wild aspect had extorted this remark. It was a dark ravine, on the opposite face of which a few small rills trickled in hand-breadth fissures down a perpendicular and naked rock, till they were lost to sight in a depth so profound, that his eye explored its details for some time in vain, before he could ascertain any probable outlet for the stream, whose existence below was only betrayed by a yet undissolved line of snow-white mist. The height on which he stood terminated abruptly before him in a broken and treacherous edge, so undermined as to overhang in many places the irregular wood which richly clothed this side of the narrow vale; while the

trees, sometimes apparently rising on knolls, and sometimes sunk so deep in chasms that their heads but just reached his sight, proved how wildly the ground beneath them was broken.

'Immediately below his feet, however, they lifted their broad summits in more regular succession above one another, till the overhanging ground forbade their nearer approach, and at the same time rendered access to the glen from that spot extremely difficult, if not dangerous.

'From this abrupt height, therefore, he gazed awhile on the scene before him, watching the stream of light which gradually poured from the ascending sun into the depth below, gilding by turns the head of each taller tree, and discovering hollows as yet unobserved.

'But the eyes detain not long the heart which is absorbed in its own joy or bitterness; and the young sportsman's thoughts at length involuntarily wandering from the scene before him, he turned his head in a contrary direction, though, it must be owned, he well knew that the intervening hill he had left behind must prevent all sight of a spot so attractive.'—Vol. iii. pp. 46—51.

'It was not marvellous, then, that poor Rover found his master's inattention this morning so incorrigible, nor that the wildness of the deep glen over which Rybrent so unexpectedly stood, had little power long to detain his thoughts, or even his eyes, which instinctively turned, as has been said, towards Warrington. The house, indeed, was not to be seen,—Rybrent having, in the vigour of youth and spirits, proceeded at so rapid a pace, as to have left it at a considerable distance behind. Though the recesses among the hills on this side of Warrington were, of course, not so familiar to him as the grounds nearer Esterfield, (the house itself having, in general, formed his stopping point,) yet he imagined he knew the scenery well, and had really, therefore, been surprised, as well as pleased, with the novelty and deep seclusion of the ravine he had just discovered; while Rover, whose dutiful patience was entirely exhausted, and whose expectations of any joint sport with his abstracted and incomprehensible master were utterly damped, had quickly plunged headlong down the difficult descent, with the evident intention of catering henceforth only for his own amusement. Both parties continued thus separately engaged during the period which has afforded time for the above abridged detail. But young De Cruce's lucubrations at length terminated in a desire to retrace his steps in the same direction his thoughts had flown, and perceiving, on consulting his watch, that Clarina's breakfast hour was approaching, he whistled to recall his rambling companion, and waited, somewhat impatiently, a few minutes for his approach.

'But his signal was in vain: Rover obeyed it not; and Rybrent soon fancied that he heard in the depth below, a succession of short and quick barks, which proved him engaged in some pursuit or contest too important, if not too perilous, to allow of attention even to his master's call. Rybrent several times repeated his name in vain, and listening more intently, he was now convinced that it was indeed Rover's cry below, at a considerable distance, and that it was the voice of fear no less than wrath. Half provoked and half excited by that eager desire of pursuit or peril, which seems inherent in man as well as dog, Rybrent pondered a moment. "I may as well return that way," he at length decided; "it is but clambering down this rough piece, and I must issue somewhere below, near the foot of that western hill at the edge of the park. I shall then be nearer the house than I am here, and can see in my way what has so roused poor Rover's alarm!"

'The thought had scarcely passed, when he was already eagerly examining the possibility of putting it in execution. Yet so extremely rugged and difficult was the descent before him, that some minutes elapsed, ere, with his utmost exertion, and at the imminent peril of a severe fall, he could so far accomplish his purpose as to get on a level with the upper rank of trees, on whose leafy heads he had before gazed.

'Once there, however, to proceed seemed less hazardous, though quite as difficult; the brushwood through which he had to press being so thickly tangled, and the ground so deeply broken, that once or twice he regretted having undertaken, for so slight a cause, a route which appeared likely from its intricacy, rather than its length, to detain him longer than he wished. To return, however, was even less easy than to proceed; besides that Rover's continued barking, which he now more distinctly heard, urged him to pursue his course. He, therefore, for some time, vigorously

pushed on his downward way, still guided by the sound, when, at length, he was somewhat startled at finding a sudden stop put to his descent by a kind of wall, which seemed to form one side of a walled hut, so old and rotten, indeed, as well nigh to give way to his pressure, yet apparently stuffed, and recently but hastily repaired in several places from within. The brushwood through which he had with such difficulty pressed, rested upon and half covered this solitary edifice; and the thought of the hut of which he had heard, but the remains of which, as Trefarley had pleaded himself unable to guide him to them, and as his own time had been fully occupied, he had never attempted to visit, now rushed into his mind. Rover's short and hurried cries, close as he was on the other side of the building, increased as he seemed conscious his master's aid was approaching; and Rybrent, with highly-excited feelings, looked for a moment on his gun, and hastily cocking it, pushed forcibly round the side of the hut, and quickly emerged on the small green before it, across which a recent track was plainly visible.

'In the midst of this little plat stood the tall tree which had been described to him, and which he instantly recognised, as he cast a hasty glance around. But no human shape was visible; while Rover, now barking boldly, and evidently delighted with his master's presence, was standing in the door-way of the wretched dwelling, within which, it was plain, was to be found the object of his terror or his wrath. Accordingly, Rybrent stooped slightly to enter the gloomy habitation, but for a moment all was too dark within to allow him to ascertain what might be its inmate. He spoke, but received no answer; and stepping forward, the light he had before intercepted, streamed across the rude apartment, and showed at its farther extremity a miserable kind of bed, extended on which lay a female figure, in a still attitude, which could be only that of death.'—Vol. iii. pp. 63—68.

LECTURES ON SCULPTURE.

Lectures on Sculpture, by John Flaxman, Esq., R.A., Professor of Sculpture in the Royal Academy of Great Britain, &c.; with a brief Memoir of the Author. Pp. 339, royal 8vo. Murray. London, 1829.

(Concluded from p. 386.)

THE 'Lectures on Sculpture' of the late Mr. Flaxman, consist of ten discourses, of which the three first relate to the history of the art; 1st, in this country, as has been already shown by the ample extracts given in our last Number; 2d, in Egypt; 3d, in Greece. The fourth lecture treats of Science, considered under the heads Anatomy and Outline, Proportions and Mechanical Motion. The fifth is an essay on Beauty; the sixth is devoted to Composition; the seventh, to Style; the eighth, to Drapery; the ninth is a review of Ancient Art; and the tenth treats of Modern Sculpture; that is to say, of sculpture from the period of the revival of the arts to the latter part of the last century.

There is not one of these discourses which may not be read with pleasure as well as improvement by the ordinary class of readers, certainly by all who cherish a love for the fine arts, equally with the student in sculpture. The learning they contain qualifies them for the instruction of the last: the easy and popular manner in which that learning is conveyed, with references to examples, either generally familiar, or made known by illustrative plates, of which there are upwards of fifty at the end of the volume, renders the perusal of the lectures a facile, interesting, and pleasing study. There are some, perhaps, who, from the known character of Flaxman, would have expected that in the lecture on Composition more stress would have been laid on the abuse of the redundant style, which had prevailed and gradually increased, from the time of the early followers of Michael Angelo until the end of the last century; and it may seem, that at the period when these discourses were delivered, the necessity of simplicity might have been more strongly urged: but respect so deservedly due to the great name of the master who was the innocent cause of the adoption of a style so inappropriate to the art which forms the subject of the lectures, and the well-known disposition of the lecturer himself for all that was pure and graceful, must silence

all objectors, in the apprehension that they should appear presumptuous in hazarding observations which he did not think it incumbent on him to make.

Neither the historical nor the scientific discourses are capable of analysis with any effect; they are in themselves concise, and it would be difficult to make a choice of one fact more interesting than another, or of one rule more important than the rest. Yet so rarely is the opportunity afforded of presenting our readers with reflections or instruction on the subject of art from a teacher so competent as the late Professor, that we cannot let the occasion pass without enriching our pages with a second selection from the valuable matter contained in the volume before us. The Chapter on Style appears to lend itself most readily to our purpose, that of giving, in a few columns, a connected view of a particular and interesting subject. We have had recourse, therefore, to the seventh lecture, for the following extracts:

'The term style, at first, was applied to poetry, and the style of Homer and Pindar must have been familiar long before Phidias or Zeuxis were known; but, in process of time, as the poet wrote with his style or pen, and the designer sketched with his style or pencil, the name of the instrument was familiarly used to express the genius and productions of the writer and the artist; and this symbolical mode of speaking has continued from the earliest times through the classical ages, the revival of arts and letters, down to the present moment, equally intelligible, and is now strengthened by the uninterrupted use and authority of ancients and moderns.

'And here we may remark, that as by the term style we designate the several stages of progression, improvement, or decline of the art, so by the same term, and at the same time, we more indirectly relate to the progress of the human mind, and states of society; for such as the habits of the mind are, such will be the works, and such objects as the understanding and the affections dwell most upon, will be most readily executed by the hands. Thus the savage depends on clubs, spears, and axes for safety and defence against his enemies; and on his oars or paddles for the guidance of his canoe through the waters: these, therefore, engage a suitable portion of his attention, and, with incredible labour, he makes them the most convenient possible for his purpose; and, as a certain consequence, because usefulness is a property of beauty, he frequently produces such an elegance of form, as to astonish the more civilised and cultivated of his species. He will even superadd to the elegance of form an additional decoration in relief on the surface of the instrument, a wave line, a zig-zag, or the tie of a band, imitating such simple objects as his wants and occupations render familiar to his observation—such as the first twilight of science in his mind enables him to comprehend. Thus far his endeavours are crowned with a certain portion of success; but if he extend his attempt to the human form, or the attributes of divinity, his rude conceptions and untaught mind produce only images of lifeless deformity, or of horror and disgust.

'When we consider these weak and inefficient attempts for a moment, with what astonishment shall we turn to the almost breathing statue, whose mimic flesh seems yielding to the touch! whose balance alarms with the expectation of movement! whose countenance beams with the sweetest charities of humanity! In these opposite descriptions we contemplate the productions of man just emerging from gross and savage nature, and civilised man, formed to moral habits, intellectual enjoyments, and delighting to trace the Creator in his works.

'Such is the difference between the beginning and the perfection of art. To mark this progress and its gradations is the object of our present inquiry; nor will our time be unprofitably employed; for if, by the characteristics of style, we can secure land-marks on the road to excellence, we may avoid the danger of deviating into the paths of error.

'The characters of style may be properly arranged under two heads, the Natural and the Ideal.

'The Natural Style may be defined thus: a representation of the human form, according to the distinctions of sex and age, in action or repose, expressing the affections of the soul.

'The same words may be used to define the Ideal Style, but they must be followed by this addition—

"selected from such perfect examples as may excite in our minds a conception of the supernatural."

'By these definitions will be understood, that the natural style is peculiar to humanity, and the ideal to spirituality and divinity.

'In our pursuit of this subject we are aware of the propensity to imitation common in all, by which our knowledge of surrounding objects is increased, and our intellectual faculties are elevated; and we consequently find in most countries attempts to copy the human figure, in early times, equally barbarous, whether they were the production of India, Babylon, Germany, Mexico, or Otaheite. They equally partake in the common deformities of great heads, monstrous faces, diminutive and mis-shapen bodies and limbs. We shall, however, say no more of these abortions, as they really have no nearer connection with style, than the child's first attempts to write the alphabet can claim with the poet's inspiration, or the argument and description of the orator.

'We shall now proceed to mark the character, and trace the progress of style, not from the earliest dawn, but rather from the sun-rise of human intelligence, when the imitative faculty is assisted by rule, and corrected by reflection—when the representation partakes, in some degree, of man's dignity in countenance and figure. In this state we find painting and sculpture among the Egyptians, whose application to geometry, and inquiries concerning the animal structure, enabled them to give a general, though imperfect, proportion and outline to their figures, whose forms, however, were more determined by simple geometrical lines than a scrupulous attention to nature.'—Pp. 197—202.

After some details of the proportions generally found in Egyptian sculpture, we have the following observation on their style:

'The style of Egyptian sculpture is simplicity in the extreme, and the magnitude of their colossal works is awful; but the simplicity is so excessive, that one face, and one set of forms, have extended an universal monotony of resemblance, as far as possible, through the differences of age and sex. The surface of the body and limbs betrays a great ignorance in the knowledge of the bones, muscles, and tendons, which produce the forms in the surface; and, although this people have been celebrated for their skill in geometry, their basso-relievos and painted compositions demonstrate that they had not advanced sufficiently to determine the balance and motion of the human figure by the rules of that science.

'The Egyptian sculptors astonish us by their indefatigable labour, but, considered as artists, they are but beginners; their works little more than bodies without souls, the dead letter of the art, whose purpose was, symbolically, to deliver an historical fact, a philosophical precept, or a divine mystery; but never to charm by life, sentiment, heroic power, or spiritual beauty.'—Pp. 204, 205.

Greek art in its state of perfection necessarily forms an important feature in this chapter.

'Grecian art began where Egyptian art ended.

'The Egyptian statuary were laborious mechanics; their works were lifeless forms, menial vehicles of an idea, or the fixed slaves of uniformity in a temple or a palace.

'In Greece, painting and sculpture were liberal arts: they were studied by the noblest and best-educated persons; they were improved by the accumulation of science; they were employed to excite and celebrate virtue and excellence; and, finally, to exalt the mind of the beholder to the contemplation of divine qualities and attributes.

'In whatever instances the institutions of Greece cultivated and rendered more powerful the virtuous exertions of mind and body, the arts of design also were animated by their beneficial effects, to a degree which surpassed the other nations of antiquity, and has laid a foundation of principles and practice for all succeeding ages.

'The early statues strongly resemble the Egyptian in attitude, in form, in want of outline and anatomical distinction; they have also nearly the same expression of countenance.

'The compositions on painted vases immediately succeeding this period offer little variety of subject:—the encounter of Theseus and the Minotaur, the duel of Eteocles and Polyneices, Hercules strangling the lion, and to these may be added Bacchanalian dances.

'The drawing of the figure, as well as the choice of subjects, indicates the state of society; the compressed abdomen and spare limbs prove habits of activity in war and the race; the Bacchanalian dances show the

introduction of mysteries and pageants in an increasing polytheism, and both seem perfectly consistent with the manners of the early inhabitants of fortified cities.

'The early arts of Greece were interrupted in their progress by a succession of political commotions and destructive wars, and we scarcely perceive any improvement in them until the time of the Seven Sages, of Pythagoras and Esop, who were all contemporaries about one hundred and thirty years before Phidias. They increased the intellectual light of their country by foreign travel and laborious study, they reformed the laws and morals, improved science and the useful arts of astronomy, geometry, numbers, harmony, and medicine, including the animal structure and economy. Their philosophy taught a purer system of divinity and providence, and the works of the poets were made known in public libraries.

'The benign influence of such advantages was felt in the arts of design, and prepared them for that beauty and perfection with which they were subsequently graced in the times of Pericles, Alexander and his successors.

'The works of the age we are now speaking of, embraced a greater variety of subjects, in composition more copious; the Bacchanalian dances were in greater number,—the labours of Hercules, Nessus, and Dejanira, processions of the gods, and acts in the Theban war. Pausanias describes the chest of Cypselus, Tyrant of Corinth, covered with a great number of heroic stories in relief.

'Although the Grecian sculpture was considerably advanced after the age of the seven wise men, some of the old barbarism still remained. Much of the ancient face and figure continued. In painting and bas relief the faces were profiles, whatever might be the position of the figure. The limbs were distorted, because the artist was unacquainted with the structure of the joint, and the lines of its perspective. The breasts, general curves of the ribs on each side of the thorax, the bend of the arms, and a small projection for the knee-pan, were the chief, and almost the only indications of bone and muscle. That infinite variety of compounded lines requisite to draw or carve the features of the face, in any even the most common views, were beyond the skill of these times. They, therefore, substituted the easier method of making the eyes, nose, and mouth of nearly simple curves, whose extremities turned upwards in the same direction. Simple geometrical forms were equally employed in the folds of drapery—parallel curves across the body or limbs—perpendicular parallels in falling drapery, and zig-zags, like reversed steps, for the edges of the drapery. Thus in the early efforts of design, geometrical formality supplied the place of the ever-varying forms in nature.

'In compositions which required an increased number of figures, two were seldom grouped; and when this was done, the group was frequently awkward, and sometimes impracticable. In the course of this period, however, the figure was better drawn, the parts were more defined; and on a nearer approach to the age of Phidias, there were some attempts to distinguish between divinity and mortality.

'The early arts above described, represented the persons and habits of a race chiefly occupied in the exercises of war and hunting, agriculture, and the care of flocks and herds, living in the open air, and defending themselves from their enemies by impregnable fortifications on rocks; their arts consisting in the fabrication of instruments for agriculture and war, the architectural construction of walls and citadels, to which may be added, potter's vessels for domestic use and sacred offices, on which they indulged the more intellectual powers, by tracing heroic traditions and religious processions.

'The Doric simplicity in this style of art, is imposing from its determined expression, and awful by an uncommon and barbarous character. The processions consist of uniform repetitions, their actions are violent, stiff, and angular oppositions: but these being faithfully transcribed from the grosser appearances of human character, expression, and action, laid a sure, though rude, foundation of principles, for the superstructure of excellence afterwards raised on them by succeeding improvements.

'From the age of Pericles, to the death of Alexander the Great, Greece was the focus of admiration to the world. Greece destroyed the Persian power, the terror of all nations! Nor was the mental progression of this people less admirable than their military achievements—their science was extended and enlarged by the succession of their wise men—their philosophers taught more distinctly and publicly the doctrine of a

Deity, and the subordinate agencies of his providence throughout the visible and invisible universe. Their poets harmonised their minds by numbers, and enriched their imaginations by presenting the range of whatever is sublime and beautiful in visible nature or mental abstraction.

'Such was the spirit of patriotism, that the richest citizens did not endeavour to exceed others in the magnificence of their houses or tables, but employed their wealth for the security and defence of their country, and in raising noble public buildings and works for the service of religion, and in honour of public and private virtue.'—Pp. 211—218.

It was at this period that two of the seven wonders of the world, the Olympian Jupiter of Phidias and the Colossus of Rhodes, were produced. After noticing the flourishing state of painting during the reigns of Philip and Alexander, and the different styles observable in the works of the professors of that art, the lecturer returns to the subject of sculpture.

'There was a like difference in the statues: the more hard, approaching the Tuscan style, were by Calon and Egeus; the less rigid by Calamis; the more soft than those already mentioned (that is to say, more resembling flesh) were by Miron. Polyclethus excelled the others in diligence and decorum, and although the palm was given to him by many, yet something was to be deducted because he was deficient in gravity; for as he added a grace to the human form beyond the truth, so he seemed not to have fulfilled the authority of the gods, and as he was said to have avoided the more important age, he presumed only to engage in lighter subjects. But the qualities wanting in Polyclethus were given to Phidias and Alcamenes. The works of Phidias are unrivalled, even if he had done nothing but the Athenian Minerva or the Olympian Jove in Elis. In this, the Homeric divinity was personified with a beauty of majesty, beyond which human intellect did not extend. Minerva, the type of divine wisdom and power, both to the philosopher and common votary, manifested the charms of celestial youth with the expression of severe virtue. These determined the acknowledged apparent forms of these divinities, from which no painter or sculptor afterwards presumed greatly to deviate. The countenances, figures, and attributes of all the other divinities in Homer, were soon after decided by Phidias and his successors, whose laws became immutable, and were submitted to with willingness, until the darkness of polytheism was dispersed by the sacred light of the Gospel.

'Yet with this pious reflection in our hearts, we cannot avoid pausing to dwell on the exquisite beauty of the ancient sculpture. The choice of the most perfect forms—countenances expressive of the most elevated dispositions of mind and innocence of character—the limbs and bodies, examples of manly grace and strength, or female elegance—youth and beauty, in all their varieties and combinations in perfection: indeed, we must believe, when we look on those forms, so purified from grossness and imperfection, that if we could see angels and divine natures, they would resemble these.

'The improvements of this and the following ages, were not confined to determination of character, selection of form, harmony of proportion, or whatever else most perfect may be conceived in the individual divinity or hero; they were extended through the various branches of association, and the noble composition of Mycon, a sculptor and painter rather anterior to Phidias, of the fight between the Lapithæ and Centaurs in the Temple of Theseus, with compositions by Phidias on the shield of Minerva, and on the throne of the Olympian Jupiter, embodied the Homeric theology and heroism, by examples which have generated or afforded principles for the subsequent efforts of painting and sculpture.'—Pp. 220—223.

The pages immediately following these extracts touch on the use of colour in ancient statues, which although Mr. Flaxman is reluctant to condemn in the cases in which it was applied, he pronounces to be utterly improper for general representation of the human figure, observing, moreover, that it will be found that for the most part the practice has been employed to enforce superstition, or preserve an exact similitude of the deceased. To this he adds:

'These, however, are in themselves perverted purposes. The real ends of painting, sculpture, and all the other arts, are to elevate the mind to the contem-

plation of truth, to give the judgment a rational determination, and to represent such of our fellow men as have been benefactors to society, not in the deplorable and fallen state of a lifeless and mouldering corpse, but in the full vigour of their faculties when living, or in something correspondent to the state of the good received among the just made perfect.

'As the consideration of painted sculpture cannot really be entitled to any place in the progress of style, we will return to our legitimate subject.

'The British Museum contains such noble relics of the Temple of Minerva, as enable us to understand the sublime conception of composition which filled the pediment, the heroic contest of the Lapithæ and Centaurs in the Metops, and the animated men and horses in the Panathænic procession of the frieze.

'It is the peculiar character and praise of Phidias's style, that he represented gods better than men. As this sculptor determined the visible idea of Jupiter, his successors employed a hundred years on the forms of the inferior divinities. This must, therefore, be denominated the sublime era of sculpture.

'Numerous were the painters and sculptors of renown, and numerous were their celebrated works between the time of Pericles and Phidias, and the death of Alexander the Great. During this time, the individual characters of the different divinities, were not only represented in the supposed period of adult perfection, but also in infancy and youth, with all the varieties of countenance and form becoming their various offices and ministries.

'The different Bacchuses from early infancy, when he was delivered by Mercury to the nymphs, when a beautiful youth of almost feminine delicacy, supported by a muse, and leader of their chorus. He is also represented with a more masculine person, as a conqueror, or the giver of poetical inspiration, until he becomes the venerable and bearded philosopher in the sacred mysteries, teaching the immortality of the soul, transmigration, with the ascent and descent to Hades, or the lower world. The same establishment of character under all circumstances, prevailed in Apollo, Mercury, and the other deities, male and female.

'During this era the Venus of Praxiteles appeared, the most admired female statue of all antiquity, whose beauty is as perfect as it is elevated, and as innocent as perfect; from which the Medicean Venus seems but a deteriorated variety.

'Whoever desires a more detailed account of the works of these ages, will be gratified by consulting Pliny, Pausanias, and the published galleries and museums of ancient sculpture and painting.

'In the times we speak of, every possible perfection was added to the sister arts that rival and accumulated talent could reach. In the characters of countenance, every gradation from simple beauty to sublime dignity—the same gradation in form, from the most slender and elegant, to the most powerful and massy—the attitudes the most choice, and the flesh seemingly yielding to the touch. The drapery in form and folds showed or indicated the body and limbs most advantageously, by playing round the outline in harmony or contrast, or giving additional effect by the projection of strong shades.

'The earlier productions of this era were distinguished by a Doric severity of style, which raised the subject above the level of general nature, and beyond its bounds. The geometrical simplicity of form was ideal; the character was decided, and the sentiment was single; of this class is the group of Niobe and her youngest daughter. A less severity of style is in the Apollo Belvidere. The most easy way of motion, and the most delicate approaches to nature are observable in the statues of Venus, the Cupid, Faun, and Bacchus, of Praxiteles.

'Busts and statues (portraits of individual persons) were not generally permitted, until near the time of the death of Socrates; and as this practice, once introduced, became popular and extensive under the successors of Alexander the Great, it was an additional stimulus to the study of the human figure in detail, and thus, as the art departed from ideal sublimity, it partook in the peculiarities of nature. It descended to the intelligible, and became a stronger resemblance of the human race.'—Pp. 228—232.

The plates by which the contents of the Lectures are illustrated, deserve mention; they are executed on stone in a free sketchy style of drawing, and many of them are replete with character.

NEW MUSIC.

Carl Maria von Weber's celebrated Walts, as originally adapted by him for the Piano Forte, (being his last composition,) also arranged as a Duet, for two Performers, with an (ad lib.) accompaniment for the Harp, and (with permission) respectfully dedicated to the Misses Beeve, of Ham Grove, Surrey, by W. Etherington, Organist of Twickenham, Middlesex. Mayhew and Co.

THE lamented Weber's last effusion, is a romantic and characteristic sketch in A flat, modulating into the sub-ordinate D flat; hence it is somewhat difficult for performers in general, being also very chromatic, in addition to the four and five flat keys noticed. This edition is by far the most estimable we have seen, as it comprises Weber's original Waltz, the same as a duet, with or without a harp part, which would render it interesting as a trio. The principal charm of this trifle, is the unusual and beautiful key in which it is written, and yet we have seen another edition, in which some barbarian (as poor old Solomon would have called him) had sufficient assurance, and evil taste, to transpose it into A natural—none but A natural would have attempted so foul a deed. Etherington is well known as a good teacher, musician, and harp-player, and his adaptation is well made.

The Alpine Herdsman, a celebrated Swiss Air, as sung by Madame Stockhausen, at the Nobility's and Public Concerts, the words by W. H. Bellamy, arranged with an accompaniment for the Piano Forte or Harp, and dedicated to her Highness the Princess Esterhazy, by F. Stockhausen. Cramer, Addison, and Beale.

THIS is presented as No. 1 of a series of Swiss airs, partly arranged, and partly composed by Stockhausen, for his wife to sing, and is a characteristic specimen of that species of music; it presents an allegro in A 3-4 time, and is a pleasing and easy trifle, composed within the low pitched scale from C below the staff to E in the fourth space, with the exception of an A as the last note, which may be omitted at option. This sort of melody is highly popular at the present passing hour, and the specimen here offered is exceedingly well arranged and brought out.

No. 2 of Rossini's Operas, arranged with embellishments for the Flute, by William Forde. Cocks and Co.

WE with much satisfaction noticed the publication of the first number of this desirable periodical, in 'The Athenæum,' No. 85, which was of 'Moiè in Egitto.' Forde has judiciously chosen another established favourite Opera for his second number, and his adaptation of 'Il Barbiere di Seviglia,' is also quite well made. Sixteen pieces (comprising all that is favourite in the Opera) are excellently engraved, and offered for three shillings only.

Le Desir, a favourite Walts, arranged for one or two Guitars. By F. Horetzky, from Vienna. Ewer and Johanning.

THIS is the briefest musical publication we have ever seen, as the parts for the two guitars occupy but one side of half a sheet of paper, and the price is ninepence! 'Brevity is the soul of wit.'

The Bohemian Melodies; as sung, with the greatest success, at the Argyll Rooms, by the Four Bohemian Brothers. Arranged by N. C. Bochsa. No. 7. Welch.

THE melody in F 2-4 time is here presented, one of the pretty airs that have been so frequently exhibited; it is intitled, 'Natali, or the Miller's Daughter;' and is published with German words, and an English version by Mr. W. Ball.

THE ATHENÆUM AND LITERARY CHRONICLE OF THIS DAY CONTAINS

FRENCH CHARACTERS.

BY A FRENCHMAN.

No III.—THE ADVOCATE OF THE NINETEENTH CENTURY.

ADIEU! ye gay quadrilles, ye wood-nymphs of the balls of Sceaux and St. Mandé! ye sentimental rambles through the groves of Meudon! ye merry cavalcades on the asses of Montmorency! Adieu! The day of mirth and pleasure is gone by for ever. The student in law, already grave and sedate, has just passed his examination. He has stood without flinching the fire of argument, unriddled the enigmas of the Sphinxes of the faculty, and won by fair playing the ermine of doctorship. He will no more be seen, armed with his five codes, climbing with nimble feet the craggy heights of the hill St. Geneviève, to attend every fortnight the call of the Professor, and, by this periodical assiduity, save his inscriptions in the course of a second Alciat. He has disdainfully vacated the eminent post of second clerk in a conveyancer's office. The dainty viands of the tavern have replaced the frugal ordinary of make-shift dinners, washed down by the waters of the fountain d'Arcueil; and from the height of the aerial mansarde of the old *hôtel garni* of the Rue de la Harpe, behold him descended into the splendid cabinet in the Rue du Coq St. Honoré!

Under the auspices of a veteran of the order, the young novice has taken the vows of Themis; and already the heedless rival of the Trepiers and Dupins rushes towards the bar, preceded by the brilliant reputation which he acquired by discharging the functions of an advocate in depute and of procureur-general in conferences. He has, moreover, made proof of his profession in the theatre: he has succeeded in getting a vaudeville received and represented at the Gymnase,—thanks to M. Scribe, who was very ready to stand godfather to the new-born; and in company with MM. Victor Ducange and Melesville, he has furnished his third of a melodrame, very dark and dreadful, which set in motion all the connoisseurs of the Faubourg du Temple, and drowned in tears all the nymphs of the back-alums.

He is therefore sure of achieving a mightily successful début. Besides, the cause affords such a fine scope for pathos. His business is to oppose a demand of formal separation for adultery, on the part of a brutal and jealous husband, against the most interesting and virtuous of wives. The orator delivers his exordium in a low and timid tone; (it is indispensably necessary in making a début to shake in every limb;) but, speedily obtaining self-command, he rises to the highest flight of his eloquence. Hark how he repairs, one by one, all the breaches in the reputation of his Lucretia, ingeniously avoiding ticklish points, proving chastity with syllogistic exactness, and reinvesting the bridal bed with all its splendour and with all its purity! The husband can no longer resist the language of persuasion; and, preventing his advocate's most brilliant reply, he throws himself at the feet of his calumniated spouse to implore her pardon, which she has the charity to grant. The audience applauded this touching scene. Seguier, from his elevated seat, smiles on this most signal of triumphs; Dupin affectionately squeezes his young brother by the hand; Berville pays him the prettiest little compliment in the most approved academical style; while an old practitioner of the Bazoches, ex-procureur to the Tournelle, turns his back upon him with a shrug of the shoulders, dreadfully scandalized to find that in the present generation knowledge and reason are beforehand with the beard.

Long since deserted by the aristocracy of the Bar, the assizes are the theatre where the neophyte is called to signalize himself. It is there that he develops the earnest of his future elo-

quence, unloads all the treasures of his sensibility, and displays all the elegance of his attitudes. In the dramatic nature of his action, it is easy to recognise the pupil of Michelot. His mellifluous and persuasive voice finds its way to the souls of a Jury, and controls at will the feelings of his audience. If sometimes—for he is easily impressed—a young beauty gives a turn to the cause by an attack upon his nerves, without interruption to his argument, the gallant orator resorts to the ethered sponge, with which he takes care to be furnished for preventing the dangerous effects of such *coups de théâtre*. How great is his joy—his intoxication, when, for the first time, he has saved the life of a fellow-creature! The prisoner is a fiacre-driver. The verdict of acquittal is hailed by the acclamations of the numerous companions whom a fellow-feeling has brought together; and hardly has the defender left the bar, when he feels himself caught in a vigorous embrace. In vain he tries to disengage himself: a prisoner in the bonds of gratitude, he escapes from the arms of his first captor only to fall into those of his neighbour; and, thus banded about from one to another, is he obliged to submit to every beard of the public Automedons, and at last makes his escape from the tortures of enthusiasm, at the foot of the grand staircase, by jumping into an omnibus.

The next day, he will see blazing in the 'Gazette des Tribunaux' the gleanings of his eloquence, collected by the stealthy pen of the short-hand writer, whose report, however, will be curtailed a full third by the scissors of the inexorable Darmaing, who does not allow advocates, be they even actionnaires, to fatigue the public with prolixities which afforded the drowsy magistrates the most agreeable dreams.

The trumpet of the periodical press has sounded the fame of our Hortensius in his native town. The pleaders of the province already call for his assistance in the grave disputes which they may have with justice. He burns to justify their honourable confidence; and accordingly, furnished with the permission of the Keeper of the Seals, off he sets! In the diligence? Nothing of the sort! A barrister travel like dealers in orvietan! Clic-clac! Mettle some post-horses and an elegant calèche are the means of transport prescribed by the decency and dignity of the order on the king's high road. The talents of the stranger orator are a nine-days' wonder on this new theatre. The Graces of the country come to smile upon his pleading; and in the hospitable banquet with which he is honoured, a friendly toast is drunk to the barristers of France, and to the repeal of the ordonnance Peyronnet.

Meanwhile, if he be anxious to perfect a reputation so happily begun, our jurist will devote himself to the most serious and varied studies. The Bar of France was too long behind-hand with the progress of the human mind and civilisation. Pascal had published his Provincialisms, a master-piece of reasoning; Molière had written his 'Tartuffe,' and Despreaux his Satires,—when in the Palais, Gauthier was still heard evoking demons in his ridiculous plea against the impostor Tancredi, and Lemaître quoting to the Parliament the example of a woman who, to prove her innocence, held a red-hot iron in her hands, without any other feeling than as though it had been a bunch of flowers! The generalisation of the subjects of knowledge is now the condition of success in every career. Thus the advocate whom Bacon has taught 'that all sciences are but so many branches of the same stem,' carefully guards against making jurisprudence a separate study, included within the circumscribed horizon of existing codes: he has discovered its relations with morals, literature, public right, history, the scenes of nature, and even trade itself. In a question of infanticide, or a case of monomania, he will reason

on medical and physiological law like a Majendie or an Orfila. In a literary question—an epigrammatic cause, he will wield with a skilful hand those wit-dipt arrows, those sharp-pointed javelins, which the father of Figaro threw so dexterously at the Goemmons. The delinquencies of the deaf and dumb will raise his arguments to the region of metaphysical controversy and the great problems of the human mind; and law-suits occasioned by the odes of a chansonnier, will communicate poetic rapture and Pindaric elevation to his inspired accents.

He will do well, however, carefully to avoid the quackery of authorship, and not to imitate those manufacturers of law, who, having had the luck to acquire a marketable name in the book-trade, weekly put their names in two-line letter, as the printers phrase it, in the title page of a new edition of some old author revived and rouged by some dozen poor knights of the quill, working night and day, at a salary of 1200 francs, to the immortalisation of the nominal manufacturer, whose fertile genius sometimes takes the trouble to enrich the work with a preface or a biographical sketch.

Like the Chambers of the Legislature, the Palais also has its *côté gauche*, its *côté droit*, and its two centres; and you may see walking to and fro in the hall, at a leisurely pace, the feudal champions of the aristocracy, the pivoted weather-gauges of the ministerial winds, and the ardent defenders of our liberties, who form a large majority. All opinions, however, meet with toleration among the Bar, provided they be open; and political sophisms themselves find grace, so long as they are the emanations of conscience. They only point the finger at bad faith, venality, and treachery. The young advocate has not hesitated a moment in choosing his colours: he has ranged himself under the banner where he thought he should find true principles combined with the interests of his country. No half-shades for him, no hypocritical dissemblings, no prudent reservations before this or that interlocutor! This may be a very useful policy to those who, accommodating their opinions to their interest, or withholding the expression of the one when it would clash with the other, are always found in the train of power, whatever be its elements; but he who thinks well,—in other words, he who can prefer the benefit of his country to his own individual profit,—need not fear to think aloud. As intrepid as the heroes of the Tribune, the citizen advocate appears at the bar to defend our immunities against the encroachments of power, when it endeavours to regain in its decisions what it has lost through legislative scrutiny. The organ of the rights of the third estate, he protests against the surreptitious registration of the electoral lists. Individual and religious liberty never had a more zealous apostle: he fears neither the opposition of power nor ultra-montane anathemas. He drags the Molitors and the Contrafattos from the midst of the square battalions of Jesuitism, to deliver them over to the galleys. The most unfortunate will become his clients. He will proclaim, were it even in the Upper Chamber, the inviolability of opinions, secured by the faith of treaties. His voice will make more than one face turn pale beneath the ministerial purple. He will evoke in open court the bleeding ghosts of the victims of the Rue St. Denis: he will denounce the tricks of a corrupt police, the Macchiavelism of informers. He will blunt by wise animadversion the too-cutting edge of our penal laws; will prepare by his luminous discussions the triumphs of the liberty of the press; and if, in some retired corner of the kingdom, a tyrannous administration, covering with the shield of office the responsibility of its compromised agents, should pretend to impose on writers courageously indiscreet, the silence of the dead who cannot complain of the wrongs inflicted on the living, he will firmly maintain, that even beyond the bounds of the metropolis, the right of animadversion is not

an usurpation of the press, nor philanthropy a contraband virtue.

Was ever mission more honourable? When did the Bar offer so glorious a harvest to be reaped? Praise to new institutions, the Palais is become the auxiliary of the Forum! Oh! may these civic trophies be the object and end of forensic ambition! May the vertigo of greatness and the monomania of power never disturb the brain of the sons of Themis! And when the spontaneous suffrages of the country have invested the man of law with its highest office, always in arms, always ready to mount the breach, watching against tyranny, let him well beware of casting on the portefeuille a covetous eye, and of taking the steps of the Tribune for the back-stairs of the Cabinet. Advocates free of the Gironde! it is you who have hitherto cultivated the nursery of our excellences. 'Stay!' said a placeman, 'don't go and embroil me with those persons: how do we know they won't be Ministers to-morrow?'

FROM 'THE PEACE' OF ARISTOPHANES.

SCENE—Olympus, Jupiter's House.

Trygæus.—Mercury.—War.—Hubbub.

Tryg. (Knocking).—Holloa! within there! Jupiter at home?

Merc. I thought I smelt a mortal. Oh! my God, What devilry's here?

Tryg. It's nothing but a beetle,* Saddled and bridled to carry single: see!

Merc. Oh! you vile scamp! you impudent bold man!

You infamous, you most outrageous scamp, How came you up here? You d—t—n scamp! What is your name? Speak. What's your name, Sir?

Tryg. Scamp.

Merc. Where do you come from? What may your tribe be?

Tryg. Scamps.

Merc. Who was your father?

Tryg. A d—t—n scamp.

Merc. Now by yon earth thou shalt not live a second

An if thou tellest not thy name.

Tryg. Oh! Sir, My name's Trygæus, of the tribe Athmone, An upright honest man, a man in trade, Neither a thief, a lawyer, nor a statesman.

Merc. What come you here for? Tryg. Gracious Mercury, To bring you a few pounds of rare rump-steaks.

Merc. Poor fellow! how could he get up?

Tryg. The glutton! He's given over calling me bad names. Pray now can I see Jupiter?

Merc. Ha! ha! You hav'nt much chance of seeing the Gods, I guess. The family left their lodgings yesterday.

Tryg. Where upon earth, then, are their Godships gone?

Merc. Where upon earth, fool! Don't you know where you are?

Tryg. Nay, Mr. Mercury, tell us where they're gone.

Merc. A devilish long way farther up; as high As they could get into the dome of Heaven.

Tryg. And how came you to stay behind?

Merc. I stay To take care of the furniture and plate, The dishes, platters, tables, and so forth.

Tryg. What made th' immortal Gods leave home just now?

Merc. Their anger at the Greeks. The mansion-house here

They've let unto a querish sort of a tenant, A Mr. War, who is to overlook You men, and farm the earth a while just as he likes; They've gone, meantime, as high as they can go, Not caring much to see you blackguards fight; To be out of the reach, besides, of all your prayers.

Tryg. What is this for? Why do they use us so?

Merc. Because ye will have war, while they advise you,

'Peace, and be friends.' For if the Lacedæmonians Gain but a little vantage, straight they cry, 'Now, by the twins, but Attica shall pay for it.' Again, if Athens get the upper hand, And the Laconians come to talk of truce, Then say your people: 'Mighty well, indeed! No, by Minerva, that will never do: Keep Pylos, now we've got it; they'll come again.'

Tryg. That's something like the talk below, to be sure.

Merc. By Jove, I don't know if ye'll ever see Peace upon earth again.

Tryg. Why what's gone with her?

Merc. Our Governor War has put her in a hole.

Tryg. What hole?

Merc. Why this down here, and look you too What piles of stones he's heap'd upon her head. By goles, I think she'll never be got out.

Tryg. And what's he going to do with us then, pray?

Merc. Indeed I cannot say—I cannot tell—I only know that yesterday he bought A kind of a mortar, a large one, very large.

Tryg. Why what's he mean to do with that same mortar?

Merc. He means, he says, to put th' Hellenic states in't,

And pound 'em cheek by jowl. But I'll be off; For, Gad's my life, as sure as I stand here, He's coming out of doors. Don't you hear a row?

Tryg. Oh Lord! oh Lord! where shall I run t' escape him?

I hear the rattling of that cursed mortar.

War. Oh! mortal men! woe to you, mortal men! I'll make you cry for mercy on your bones.

Tryg. Oh! Prince Apollo, what a monstrous mortar!

And what an evil cast in his ugly phiz! Is this the devil we think to get away from, So wonderful, so horrible, so big— Goes with those legs at least ten leagues an hour!

War. Woe to thee, Prasiæ! city famed for leaks, Thrice, four times, ten times, most ill-fated city, This day thou'rt dust! (We shan't want any more garlick.)

Tryg. Come, that won't hurt, however; that's nought to us;

Let him pound all Laconia if he likes.

War. Oh! Megara, Megara; woe unto thee Megara

I'll pound thy battlements, Megara, for my supper.

Tryg. Oh Lord! oh Lord! a' mercy; and he'll make

Sharp sauce, I reckon, of Megarian tears.

War. Oh Sicily! oh Sicily! thou shalt suffer.

A noble state, indeed, to mince and grind.

A little Athenian honey over this—

Tryg. Holloa there! stay: you best not use that honey.

Two shillings a pound! Consider, don't use that.

War. Hubbub, come here.

Hub. Yes, Sir.

War. I'll break your bones.

Confound your laziness. Take that, you mongrel.

Hub. Oh master! softly, master. (Aside.) How

the garlick

On his d—n'd knuckles makes my poor eyes water!

War. Fetch me the pestle.

Hub. Lord, Sir, don't you know

We haven't one. We only came last night.

War. Step down to Athens, then, and fetch me one.

Hub. Yes, Sir; directly, Sir. Confound his knuckles!

Tryg. Ah me! we men, poor rascals that we are,

What will we do? here's a sad scrape indeed.

If that young imp should bring a pestle back,

Yon devil will soon have ground the states to powder:

Pray God he tumble down and break his neck!

War. Here he comes. How now? haven't you got one?

Hub. No;

That great Athenian pestle, the foul tanner Cleon, who peated Greece so long and well, Will do no work again: he's dead and gone.

Tryg. By Pallas, he died gloriously, and just

In time to save his country a good pounding.

War. Why, then, go try at Sparta; and make haste.

Tryg. Oh mortal men! what's to become on 's now?

I wish (by the Lord) I were on earth a moment,

Within some temple, where I could fall down

At Jupiter's statue, just to pray a little That vagabond messenger might sprain his foot.

Hub. A well-a-day! Alack and well-a-day!

War. Holloa! what, haven't you got one now?

Hub. No, Sir;

The Lacedæmonian pestle's also gone.

War. What, Brasidas? How, you rogue?

Hub. They lent him, Sir,

To their allies in Thrace, and lost him there.

Tryg. By Pollux and by Castor, but I'm glad on't. Courage, good mortals; all may yet go well.

War. Humph! Hubbub, take the mortar in; I'll go And make a proper good one for myself.

THE FLOWER GIRL.

If I beheld it in a dream,
Or if by summer's waking beam,
Ah me I cannot tell;
But this I know, it was a sight
To make the heaviest bosom light
By some mysterious spell.

Along the grass a tufted wood
Its pale and wavering shadows strewed,
Broken by sunny lights,
Gleams of the noon, like sportful elves
On slope hill-sides, or sandy shelves,
Wild troop of wandering sprites.

And leagued in scattered knots the flowers,
Filled with fresh life by nightly showers,
Breathed out a fragrant air,
By the strong oak, or lady beech
There was a tranquil nook for each,
And all were joyous there.

Like noises of the human crowd,
The rooks made known with clamours loud
Their high and leafy state;
Like lonely voice of sage or bard,
The cuckoo from the brake was heard,
The shy wood-fairy's mate.

The sky laughed out at summer's birth,
The breeze was singing o'er the earth,
Each leaf in song replied;
And birds and flies in glittering rounds
Enriched the air with murmured sounds,
And streams like gems were dyed.

The world no more was shrunk or cold,
No more a withered beldame old,
The growth and wreck of time;
But a bright spirit newly born,
Waking amid a glorious morn,
Flower of Creation's prime.

Methought that I in covert lone,
To bird and wandering doe unknown,
O'erlooked that Eden vale,
And with the finer sense was filled
That from each blade of grass distilled,
And blew in every gale.

Quick through the wood with airy spring,
And foot as light as swallow's wing,
Came forth a maiden child,
Her eyes were soft with dreamy light,
Her forehead like a star was bright,
Her look was free and mild.

Five summers' joys had stirred her breast,
Which in a scarf of white was drest
With strings of berries bound,
Her skin below the knee was seen,
And sandals knit of rushes green,
Were twined her ancles round.

To tufts of all the flowers that blow,
She murmured greetings sweet and low,
From each a flower she took;
And she herself was fairer far
Than the earth's gayest garlands are;
I lived but in her look.

And when her ministry was done,
And those frail spoils of nature won,
She wander'd from mine eye,
E'en as a golden morning ray
Fades from the darkened field away,
When clouds come o'er the sky.

Fair being, to my soul I said,
May angels float above thy head,
Bright train and sure defence;
Safe be thy steps from wrong or wrath,
No gaze impure beset thy path,
Or scare thy innocence.

* Trygæus, having caught a large creature of this species, appears on horseback, as he calls it, at the gate of Olympus, to the admiration of Mercury, as above.

The gorgeous wreath thy hand has culled,
Must by a few quick hours be dulled,
And shrunk to phantom leaves;
Its scents to other climes will fly,
And shadows dim the richest dye,
That earth from heaven receives.

And those gay parent knots of bloom,
A season's flight shall bring the doom
Of all so loved by thee;
And not a leaf in field or wood
Shall cheer and light the solitude,
Or woo a pilgrim bee.

But thou, fair child, while fades the prize
That decks thy breast and glads thine eyes,
Shalt live, and grow, and flower;
And time, while on through chance and change,
This shifting world must ever range,
Shall swell thy beauty's dower.

No sweeter braid shall bind thy brow,
Than that thy hand has culled but now,
And like a sceptre bears;
But oh, how lovelier far shall be
The face that now in childish glee,
An embryo glory wears.

ROYAL INSTITUTION.

THE meeting of Friday last, which was the closing one for the season, was occupied with one of the most interesting, and, as regards science, one of the most important, lectures which have been delivered this season. Mr. Faraday had undertaken to impart the progress he had made in his experiments to obtain a perfect material for the object-glasses of telescopes. He commenced by stating that he should have preferred delaying the disclosures he was about to make until he could have announced his complete success, but that the closing of the season, and the rumour which had become public, that the object of his experiments had been effected, induced him rather to make known at present the point at which he had arrived, than postpone the explanation until the next year. Before entering on the history of the course that had been pursued, with a view to procure more perfect achromatic object-glasses, Mr. Faraday explained their use in telescopes, and the disadvantages attending the employment of either crown or flint glass. These were stated to arise from the separation and dispersion of the rays of light necessarily accompanying the use of simple lenses, as the object-glasses of refracting telescopes, and which produced a coloured image. The method by which this difficulty was obviated by the discovery of Mr. Dollond, was illustrated by reference to diagrams. Mr. Dollond had observed that substances refracting light did not all refract in the same ratio, that substances had different dispersive powers, and that by the juxtaposition of substances having various refracting powers, the production of colour might be annulled; and it was shown that the combination of three prisms having different dispersive powers or different refracting powers, would be achromatic, or free from colour, but that for this purpose it was requisite that the glasses should be perfectly homogeneous.

But the imperfections to which glass is liable are fatal objections to its use for achromatic purposes. The principal of these arise from the derangement of the fluids which cause *striae*, curls, or waves, from which it is hardly possible to find a glass that is free; the bubbles formed on the glass are another great, but less important, objection.

Several attempts had been made to correct the evil by which glass was thus rendered inapt for achromatic purposes. The most important result had been the making of a glass now at Paris of eleven inches in aperture, or diameter, with a focal length of twenty-five feet; another, six inches in aperture, with a focal length of ten feet six inches. Mr. Faraday referred, also, to the celebrated Dorpat instrument, praised by all astronomers, and made of glass procured by Fraunhofer of nine inches in diameter and fourteen feet focal length, and Dollond also made one of

eight inches in diameter, and ten feet six inches focal length.

The difficulties which still exist in obtaining perfect glass, whether crown or flint, were stated to be immense. Crown glass was explained to be preferable to plate glass, but liable to large veins. Mr. Dollond, it was affirmed, had not been able to procure a piece of glass fit for his use, more than four inches in diameter, for five years past. The desire to obviate these inconveniences in the formation of glass, led to the appointment by the Royal Society of a Committee for the purpose of inquiry into the subject. The committee was appointed in 1824, by Sir Humphry Davy; and on the mention of the name of the late President of the Royal Society, Mr. Faraday took occasion to allude to his recent removal from the scene of his researches, and noticed in a feeling manner, the losses which the scientific world had sustained within a few short months by the deaths of Dr. Wollaston, Dr. Young, and Sir Humphry Davy.

Mr. Faraday then proceeded to give the history of the formation, in 1825, of a sub-committee, consisting of Mr. Herschel as mathematician, Mr. Dollond for the handywork of the inquiry, and himself for the chemical observations. The desire of the sub-committee to make experiments on such a scale as would entail no serious consequences on failure, induced the Royal Society to make an application, in 1827, to the Royal Institution, to allow the use of their establishment for the purpose. This request was granted, and the investigation was taken up in September 1828; and Mr. Faraday had the satisfaction of being able to report that glass had been made in the Institution.

The principle on which the experiments had been conducted, was the endeavour to obtain a freely fusible glass made uniform by stirring,—the ingredients used being oxyde of lead, silica, and boracic acid. From this process a glass was soon obtained, twice the weight of ordinary glass, not colourless, but slightly yellow, and possessing a high refracting power. The implements at last adopted for the experiments, after much time and labour and many disappointments, were foils of platinum for the fusing vessels. On finding that holes were made in platinum by the lead, recourse was had to the conversion of lead into nitrate of lead, and this proved a remedy for the difficulty. The silica used by the experimenters was a pure silica of their own, procured by especial process. Mr. Faraday explained the inconveniences found to attend the use of iron vessels for heating, on account of the carbon contained in iron, and the carbonic oxyde liable to be formed during the necessary process, and which had the power of injuring platinum. The iron vessel in which the first experiments were made, was consequently discarded, and slabs of the stone of which cornish crucibles are formed were substituted. The rakes used for stirring the fluid were produced, and Mr. Faraday explained the manner in which he had overcome, among other difficulties, the inconvenience arising from the porosity of the slabs: this evil he had remedied by procuring a counter-current, which proved so effectual, that since it was resorted to, no clouded glass has been produced.

In conclusion, it was stated, that the results of the experiments were satisfactory: advances had been continually made, but not without great labour. Glass had been sent to Mr. Dollond, and three telescopes had been made from it, of progressive degrees of perfection; the last had been completed only a few hours before the meeting, but promised to perform well, and is superior to all former attempts with glass of the same manufacture; but whether it is equal to the best telescopes made with flint glass, remains to be ascertained. As to the constancy of the result, whatever that result might happen to be, Mr.

Faraday assured his hearers there was no doubt, and at present there was no reason for apprehending that the result would not be perfect.

On the tables of the library were various mechanical models, and presents to the Society of objects in Natural History and the Fine Arts, by Mrs. Jones and Mr. Henning; but that which attracted the most attention, was a specimen of the strength of New Forest oak timber—a stake of timber of seven feet in length between its points of support, and of five inches scantling, which had required 9,061 lbs. weight to break it. The axis of fracture was a very little above the middle of the thickness, not straight across the piece, but making an angle of about 80 degrees with the horizon, that is to say, a little above the middle on one side, and a little below it on the other. The weight which broke the piece was alone mentioned, but neither the degree of flexure when it broke, nor the weight which first overcame its elastic force, and produced a permanent deflection, was noticed in the paper which accompanied the specimen.

PHILHARMONIC SOCIETY.

THE eighth, last, and most brilliant concert, not only of this season, but perhaps ever witnessed, took place on Monday, June 9th, exhibiting as fine a specimen of vocal and instrumental musical talent as Europe can boast. The best leader and conductor were chosen to terminate the season; namely, Spagnoletti and Sir George Smart. The Concert commenced with Spohr's magnificent, melodious, and scientific Sinfonia in E flat, which he himself introduced to the Society, and led at the last performance of the Philharmonic in 1820. This very beautiful composition, if not unrivalled, is at least, we think, unsurpassed, even by the great Mozart, Beethoven, or Haydn; and so think all lovers and judges of instrumental music that have heard it. The opening movement is of extreme difficulty, on account of the many rapid diatonic scales in unusual keys, given to various instruments, in imitation of each other, and which are literally impossible to be well performed, (or scarcely performed at all,) upon oboes, clarionets, and bassoons. The allegro exhibits Spohr's finest style; but the adagio in A flat is altogether delightful, and a masterpiece of science, melody, and harmony. The minnets (in Haydn's manner) are playful and well conceived, and the last movement, in common time, is of so pleasing and graceful a character, that it would answer admirably to be adapted in an opera ballet, as a figure dance. The whole went off exceedingly well; and Spohr's music, upon this occasion, seemed to be more justly appreciated, according to its superiority, than ever before. We hope and trust, that next season all his other Sinfonias will be performed, especially the very beautiful one written expressly for the Philharmonic Society, and which they have still in manuscript.

Before proceeding with the programme of the Concert regularly, in our usual manner, it may be well to remark, that the Directors, a little time since, being desirous of the powerful and attractive assistance of Mademoiselle Sontag, requested to know upon what terms she would sing at one of the concerts: her demand was twenty-five guineas, which they found either beyond their means or their liberality, and declined the engagement. The lady, however, in a very handsome and obliging manner, wrote to them before the eighth Concert, to say, that the pleasure of singing to so superior an orchestra as the Philharmonic, and in a Society of so excellent a nature, would be to her a sufficient reward, and that she would willingly perform without any pecuniary remuneration! The other star of the present day, Madame Malibran Garcia, hearing of this occurrence, would not be outdone in spirit and generosity, but very kindly proffered her gratuitous performance; and thus these deservedly admired vocalists did themselves and the Society honour.

The second piece, therefore, performed, was Mercadante's Recitativo ed Aria, 'Del mio pianto,' beautifully sung by the admired Sontag. Her animation and brilliancy seemed in accordance with the liberal engagements she had made, and her success was transcendent.

No. 3—Fantasia, Flute, Mr. Nicholson, who never played with more taste, spirit, and excellence. He performed his admired variations to the French air, 'Au clair de la lune,' in an unrivalled manner, and still holds the highest pre-eminence upon his instrument,

although the great continental flautists, Drouet and Tulou, are here to rival him. It is gratifying to the national pride to reflect, that the best performer upon his peculiar instrument (with the exception, perhaps, of Puzzi and Dragonetti, who are, as it were, naturalised among us) is an Englishman!

No. 4, Aria, Madame Malibran Garcia, 'Nacqui all'affanno!' from Rossini's 'Cenerentola.' This performance, also, was delightful, although a contemporary writer, in a critique upon this Concert, throws out some angry and spiteful remarks upon the choice of the music performed by Sontag and Garcia, arising principally, it should seem, from an unfortunate and unconquerable prejudice the critic entertains against Rossini's compositions. We agree with him, that 'much has been said on the subject of the despicable vocal music which the directors allow to be introduced at the performances of the Philharmonic Society,' and much has been also said by us in 'The Athenæum'; but the thing *has* been much reformed this season, and Donzelli, Stockhausen, Caradori, Paton, Phillips, &c., have each performed Mozart, Beethoven, Haydn, and Spohr, in a manner that has deserved and received particular approbation. In the present instance, surely the vocalists of the highest rank, who sang gratuitously, might be allowed their choice of subject; but, as the critic did not seem aware of this fact, we drop the ungracious subject. Malibran sang exquisitely! Her extraordinary compass of voice is astonishing, and, probably, unparalleled: on the present occasion, she sang down to F sharp, on the fourth tone in the bass clef, and she has sometimes been heard to skip with the most extraordinary exactitude from the E flat of the bass to the E natural upon the third ledger tone above the treble staff,—the surprising, difficult, and uncertain distance of three octaves and a semitone! Her choice of the song from 'Cenerentola' was certainly not a happy one; but she enchanted her auditors notwithstanding.

No. 5 concluded the act, with Weber's overture, 'Der Freyschütz,' in which the orchestra (under the able attention of Sir George Smart) took uncommon pains. Poor Kiesewetter's enthusiastic energy which he used to exhibit in this (his friend's) overture, will, we fear, never be equalled; but Spagnoletti exhibited his best exertion and fire, and the performance was admirable; indeed, so much so, as to cause the audience to request an encore. But it happened that the King had a Concert, at which Sontag and Malibran, with Lindley and Dragonetti, were engaged;* the Directors therefore justly feared that if the overture were repeated, those distinguished vocalists and instrumentalists must have been necessarily absent in the second act of the Philharmonic Concert; this was explained to the audience by Sir George Smart, and some degree of impatience which had manifested itself was appeased.

Haydn's Sinfonia, in B flat, No. 9 of his last twelve, commenced the second act, and went quite as well as usual. The adagio (in 3-4 time) of this Sinfonia, is a quiet, classical piece of writing, almost too grave for a full instrumental performance. It was adapted as the middle movement, by Haydn himself, to one of his piano-forte sonatas, (we believe about opus 73 or 74,) [at the time it was first produced, and is said to have been an especial favourite of the composer.

No. 7, Duetto, Mademoiselle Sontag and Madame Malibran Garcia, 'Ebbene—a te: ferisci' from Rossini's 'Semiramide.' This was the grand attraction of the evening; and we hesitate not to say, after

* With respect to this Concert of his Majesty, at which all the eminent vocalists were engaged, we lament to state that his advisers (said to be Sir Andrew Barnard and Kramer, the King's head musical men) should not have urged the employment of a full instrumental orchestra, as proper and necessary, instead of accepting the proposition of a certain performer, who said, 'Give me ten guineas, with similar sums to Dragonetti and Puzzi, and we can form orchestra sufficient.' They were forced, ultimately, (on the evening of performance,) to send for the powerful addition of Lindley's talent, but these four instrumentalists were the only persons engaged! Several performers of the Philharmonic orchestra jocosely offered to set off in a body, to offer their services to his Majesty, gratis, out of loyal patriotism; and it would have been no contemptible joke to have seen them arrive with their instruments, as volunteers, similar to a clan of Scotch Highlanders with their weapons, offering their services to Prince Charles. The serious part of this story is, that, although undoubtedly the King may engage whom he pleases, (for kings can do no wrong,) yet the mischief is in the precedent and fashion afforded to all who may give musical parties in future. We know and lament that vocalists generally prefer a subdued accompaniment, as fearing the rivalry of stringed instruments with their own performance; but Sontag, in the best possible taste, volunteered her services to the Philharmonic Society, professedly for the purpose of singing to so unrivalled an orchestra, as she emphatically assured Sir George Smart it was, on the night of the fourth Concert last year.

witnessing every species of vocal performance in this country, from the days of Mara in the year 1800 to the present period, that nothing has been heard so finished, so beautiful, or so interesting; in the immediate duet parts, every breath, every aspiration, was given so simultaneously and so perfectly, that the two voices seemed to be actuated by one person only. This, we remember, was supereminently the case with the Demoiselles De Lihu, and constituted *their* peculiar attraction; but with Sontag and Malibran, the same admirable exactness was united to *their* very superior voices, and abilities of execution, and the *total ensemble* was consequently transcendent. The andante sostenuto, 'Giorno d'orrore,' was eminently interesting, and became quite a different sort of thing from the performance of the same piece by Caradori with Cornega in 1827, or again with Brambilla last year, or even by Pasta at the King's Theatre. Double cadences, either by a voice and an instrument, or by two voices, are almost invariably the dulllest and worst arranged things possible; but, upon this occasion, the cadence of Sontag with Malibran was perhaps the most beautiful feature of the performance, not only as regarded the execution displayed, but the excellent arrangement of the passages, musically speaking; and especially let it be remembered, that it was the *composition* (for it deserves that denomination) of Malibran herself! The orchestral performers seemed to be inspired by the excellence of the singers, and the whole was exceedingly delightful, and highly superior to any previous performance of the same description; and we offer this as the unanimous opinion of the very experienced orchestra.

No. 8, Fantasia Violin, M. De Beriot, composed by himself. This gentleman confessedly stands in the foremost among violinists, from the extreme exactness and beautiful polish of his performance, and he played with his usual propriety and success. He keeps time and tune better than any other concerto performer, (always excepting Lindley,) and his downward staccato bow is unrivalled.

No. 9, Recit. and Air, Mr. Phillips, 'Roaming on foaming billows,' from Haydn's 'Creation.' We pitied poor Phillips, to be placed as a make-weight, to fill up, as it were, the measure and quantity of the Concert; for, although his singing was good, as usual, and the piece chosen was unexceptionable, yet, after the brilliant effusions, of various descriptions, that had been exhibited, his song almost appeared '*flat, stale, and unprofitable*.'

The Concert and the season, during which such an excellent series of interesting performances have been exhibited, concluded with Beethoven's well-known Overture to 'Egmont.'

The seven Directors have been,—Weichsell, John Cramer, T. Cooke, Latour, Bishop, Dizi, and Dance. The Leaders—Spagnoletti (twice), F. Cramer (twice), Mori (twice), Weichsell, and Loder, (the same as last year.) The Conductors—Messrs. J. Cramer, Bishop, Sir George Smart, Attwood, Dr. Crotch, and Potter. The Singers—Mademoiselle Sontag, Madame Malibran Garcia, Madame Caradori Allan, Miss Paton, Madame Stockhausen, Mademoiselle Blasis, Madame Camporese, and Madame Wrantzikij; Signors Donzelli, Curioni, Zuechelli, Pellegrini, Begrez, De Begnisi, Bordogni; Messrs. Phillips, Sapiro, and Roemer. Concertos on the Violin, by De Beriot, Oury, Hauman, Tolbecq, and Artôt; on the Piano Forte, by Cramer and Schlesinger; on the Flute, by Nicholson; and, on the Horn, by Puzzi; besides Concertante Performances by Weichsell, Lindley, Mrs. Anderson, Dizi, Willman, Mori, Spagnoletti, &c.,—the whole unequivocally presenting as fine and unrivalled an assemblage of talent as the musical world can possibly furnish.

THE DRAMA.

King's Theatre.

Most people enjoy the music of Rossini, but all delight in that of Mozart. Hence, overflowing houses on occasion of the several recent performances in the Haymarket, almost calling to mind the glorious season of 1828, when Pasta and Sontag aroused well nigh to madness the enthusiasm of the town. Madame Malibran had her benefit on Thursday evening, and displayed equally her taste and policy, her own predilection for what is best in her art, and her knowledge of her audience, by choosing the 'Nozze di Figaro' for the principal attraction of the evening. The casting of this delightful opera was worthy of its music, if indeed any casting can do perfect justice to a work so exquisite. With Mademoiselle Sontag in the Countess, Madame Malibran in Susanna, Signor Donzelli in the Count, and

Pellegrini in Figaro, each emulating the other in doing their utmost, what was left to be desired? Malibran showed herself even more effective in the opera buffa than in the opera seria: lively without being boisterous, arch but never vulgar, she acted Susanna to the very life; her scene with the Count and the page was excellent, but even this was surpassed by her expression on undecieving the Count, and disclosing herself to him in the attire of Rosina. Sontag looked the character well—she was perfectly lady-like—the part, it is true, requires but little acting; and certainly this exquisite songstress gave no needless exertion to throw into her part more than was required. The exercise of her musical powers, however, lost none of its effect from the tameness of her acting: she executed her part most charmingly, and with that organic facility and ease of manner, the result of conscious power, which gives such additional zest to the enjoyment of the performance of first-rate artists. Malibran possessed equal self-command in her part, while she displayed a more intense feeling of the beauty of the music. The duett 'Canzonetta sull' aria,' as sung by these ladies, was a treat, to which music, perhaps, can hardly present an equal. It was encored, as was also the quartett in the first act, 'Piano, piano.' Donzelli has not, perhaps, in Mozart's operas, so many opportunities of displaying the peculiar power of his voice, as in Rossini's; but, after all, it is not much to his disadvantage, or that of his hearers, that he is thereby restrained from over exerting his own voice, and the ears of his auditors. We never heard him finer than in the few words in which he asks Figaro whether he knew who wrote the letter. Pellegrini acted Figaro with his usual spirit. We envied him the slap which he received from such a Susanna. It is our duty also to mention, with particular commendation, the performer, who on Thursday acted the drunken Gardener.

There was, however, one dreadful *hiatus* in the performance; for the leaving the part of the Page in the hands of Madame Castelli, was rather worse than omitting the part altogether. As long as this lady seemed aware of her own deficiencies, we were careful not to occasion her any pain by unnecessarily remarking them. But, when she aspires to such a part as that of Cherubino, her ambition must be checked. She must be told, that she neither looks, acts, nor sings her part. M. Laporte also ought to learn, that the part of the Page is one of too much importance to be so neglected. If Madame Vestris's engagement at Dublin so suddenly occasioned her absence, the disappointment should not be aggravated by such a substitution. If it was impossible to get any of the better English singers to take the part, even Specchi would have been preferable to Castelli.

Covent-Garden.

ALLEGED OUTRAGE ON THE DECENCY AND GOOD TASTE OF A BRITISH PUBLIC.—We were much shocked, in the course of last week, to hear that decency and good taste were to be most dreadfully outraged at one of the big theatres. We thought it right to institute a very minute inquiry respecting the truth of so inexplicable an occurrence. We well knew that the monopoly of those immense establishments was instituted solely in order to protect the tenderness of national taste. We knew that dramatic morality was under the careful surveillance of a Colman and a Montrose: and, above all, we felt perfectly assured that nothing like indecency would ever be tolerated by a British audience.

It appeared, however, that a Mr. Watson and a Miss Hughes were to have a joint benefit at Covent-Garden, and had advertised, as an attractive performance, 'The Beggar's Opera' reversed; that is, that the female parts were to be performed by men, and the male characters personated by females. The news of this monstrosity struck terror into domestic life; and fathers and brothers began to feel due horror at allowing such exhibitions to shock the eyes of females of respectability. It was feared that much injury would result to society from such a spectacle; that the moral order of things would be entirely reversed; and that this was but the first step of an innovation which might change for ever the *habits* and relations of the two sexes. Letters on the subject began to appear in the 'daily sources of intelligence': the accurate barometer of 'The Times' marked the rising indignation of the canting world, and 'The Globe' seemed ready to burst with an earthquake of indignation. Miss Hughes perceived the first mutterings of the storm, and withdrew her countenance from the transaction, and her name from the play-bills. Her friends entered a solemn protest against the supposition that she had been in any wise connected with the choice of the per-

formance, and Mr. Watson was left alone to enjoy the indignation of the moral, and the profits of the performance. A controversy now arose between the friends of Mr. Watson and of Miss Hughes. Great praises were lavished on the lady who had sacrificed her interests at the shrine of decorum. If some compared her sufferings in the cause of virtue to those of the virgin sufferers of yore, there were others who proposed to mark the existence of a different and a better state of things, by proposing a pecuniary compensation to the martyr of morality. The friends of Mr. Watson urged a precedent in his favour, pleaded the number of his children, and remarked severely on the caprice of Miss Hughes, with many unhandsome allusions to certain secret motives for her sudden fastidiousness.

On Saturday, in defiance of the anger of the decent part of the community, the obnoxious exhibition took place. A large audience was assembled, composed of the immoral who came to enjoy, and the moral who came to condemn the spectacle. So great were its attractions that Liston got but a poor benefit at Drury-Lane the same evening.

The performance went off in perfect quiet. On its commencement, certain ladies in the boxes, who had apparently come in order to go away, withdrew the sanction of their presence. The hisses of the moralists corrected Mr. Reeve for an undue elevation of the lower part of his female habiliments. The only other objection to the piece was that it was very stupid. It is hard to pay for three acts of a joke which becomes wearisome after the first scene.

The outcry that has been made about the indecency of the performance seems rather unwarrantable. It is certainly an indelicate act in a young woman to exhibit her shape in a tight pair of breeches. But moralists ought to be consistent. The British public has applauded the exhibitions of Madame Vestris and Miss Love in male attire, and consequently encouraged other ladies to court the popular favour by the same means. It would be absurd to say that the number of females so acting in the present case increases the indecency of the performance.

But it is objected that by this change, exceedingly libertine sentiments and low language are put into the mouths of actresses. On any better regulated stage, such as the French, this would be a very rational objection. But in our theatres the most usual, and certainly the most approved purpose for which females appear on the stage, being to utter indecency for the amusement of the galleries and upper boxes, it is a matter of little importance whether they utter them in breeches or in petticoats.

We would also entirely acquit Mr. Watson of any intent to insult the taste of the play-going public. Mr. Watson doubtless considered the present order of theatrical things as one which could not be deteriorated by any change. He knew that it is the principle of the modern drama to deviate as far as possible from nature. The public is greedy of change, and he gave them what they had not had before. It is fond of farce, and he gave them a piece of buffoonery perfectly in accordance with their liking. Nothing could be more gross than the exhibition,—nothing more vulgar and inane. As he could only judge from past experience of what things had been honoured by the meed of public applause, he was right in judging that grossness, and vulgarity, and absurdity were the qualities that would raise the grin of British box and gallery.

At the same time we do not mean to disapprove of Miss Hughes's scruples. In this free country no woman should be forced to violate decency, particularly if it does not become her to do so. At any rate, we are happy to assure the British public that the performance of Saturday has not in our opinion impaired the character of the British Theatre: and we have no doubt that we shall continue to consider our stage as the most moral, the most decent, and the most refined in the world.

Haymarket.

THIS amusing summer theatre opened on Monday to an amiable summer audience, very brilliant in appearance, although their numbers, in the pit at least, were calculated better for their own ease and coolness than the profit of the managers. 'Spring and Autumn' was selected, as a well-established favourite, to usher in the newer entertainments of the season; and Mrs. W. Clifford, as the jealous 'old girl' of the piece, carried her counterfeit presentment to most laughable perfection. But the great epoch of the evening was the entrance of Parren, which was greeted with reiterated rounds of applause, whether to console the Thespian

hero for the buffetings of Themis, we inquire not; but so warm a welcome, whatever were its cause, called forth so much of genuine comic power from its object as might well suffice at least for its justification. 'A New Military Ballet' was the next performance, and narrowly escaped damnation, from which it certainly was not saved either by the grace or the intelligible meaning of its movements and incidents, but simply by the *pas de deux* of a pretty little girl and boy, which called the attention of the audience from the demerits of the piece as well as from the merits of the other performers. A very pleasant piece, in one act, entitled 'Lodgings for Single Gentlemen,' was added, 'for the first time,' as the bills inform us, to the catalogue of the evening. The principal merit of the plot, was being easily understood, and the entanglements in which it involved the whole *dramatis personæ* afforded still increasing merriment up to the moment of the dénouement. Mrs. Prattle, (Mrs. Glover,) lets lodgings for single gentlemen, and in addition to her not very novel punctilios concerning the 'genteel' and 'correct' character of her house, she possesses a no less ordinary characteristic of her sex and station, inordinate inquisitiveness into the private affairs of her lodgers. 'Parlour,' 'second-floor, and 'attic,' have been each and all detected in their most secret doings by the indefatigable Mrs. Prattle. 'Drawing-rooms' alone (Captain Postlethwaite) remains inscrutable, and Mrs. Prattle's curiosity is screwed to the utmost, by the fact of her 'Drawing-rooms' never stirring out of the house during the unprecedented term of nearly a fortnight. This phenomenon turns out to have been consequent on a solemn promise made by the Captain (Vining) to his intended spouse (Miss F. H. Kelly), the breach of which would annul the tender compact between them; and much of the humour of the piece turns on the efforts of Mrs. Prattle to make herself acquainted with the secret, by the seduction of Trusty, (Webster,) to the betrayal of his master, by means of 'tea and muffins,' &c. His resistance to these forms of temptation, the precarious tenure and final breach of compact by his master, and the terrible scene produced by the detection of a lady too many within the precincts of 'the little book-room,' leave no time for criticism or yawning; and the somewhat artificial complication of the story by a second solemn vow between Miss F. H. Kelly and her brother, to share together the mutual sweets of widowhood and bachelorship, may be excused, as being in some degree requisite to complete the full measure of embarrassment and ludicrous misconception on all sides. Mrs. Glover's acting, if possible, was even more clever than usual. Miss F. H. Kelly dressed and looked a highly desirable widow. Mrs. Ashton (from the Theatre-Royal, Bath,) played all the part set down for her well. Webster was inimitable as Trusty, and Vining played with spirit in the character of his master.

Surrey Theatre.

GAY's exquisite ballad has given a name to a piece which has nothing to do with the song, nor the song with the piece, except that one of the characters sings during the progress of the latter.

The plot is very tragical, and the whole lacrymose in the extreme. A drunken Lieutenant is rude to Miss Susan, (the maid become a wife,) and this rudeness is resented by 'Sweet William,' who not only strikes but draws and wounds his officer. The over-resentful lover and husband is brought to court martial, tried and most solemnly condemned to death. Then follows a touching farewell with his messmates, (pretty good, but overdone,) and a farewell with Susan to the pleasing accompaniment of some death-guns, announcing that the moment for his execution is pressing on. William's last request is, that Sue shall have him buried under a tree (near the village church) where they used to play at hide-and-seek, when children. The last kisses are interrupted by an officer and some sailors, who give him forcibly to understand it is time to leave the cock-pit for the yard-arm. The Black-eyed Maid, (Miss Scott, who really enacted her part well,) falls lifeless, and William gazing at her once more with tenderness, summons up the man within him, and goes to quarters. There are all the close details of domestic tragedy and familiar horror that render the 'Maid and Magpie' so touching to some people, and so wholly insupportable to others; there are even more, for there is not merely a funeral procession towards the 'rope,' but the very 'rope' is slung in view—the very noose is tied before our eyes,—William throws himself on his knees to say his prayers,—the captain, officers, and 'merry middies' do the same,—and the group is very edifying, and very much like that formed by the Children of Israel who sing the sublime chorus in

Rossini's 'Moisé,' only they do not sing their prayers. 'Sweet William' rises, seizes the flag of Old England, (lowered on the sad occasion,) presses it to his lips, and is then mounting most courageously to the running rope, when the officer he had struck (and whose life he had twice saved) rushes to the ship with a free pardon. When William's offence was committed, it appeared he was no longer in the 'King's service'; his discharge had been already signed, but detained by a crafty and malignant relation. Black-eyed-Susan flies to the deck, and into her William's arms,—comrades embrace, and officers felicitate, and the sorrowful business ends most joyfully.

The piece was much applauded. 'Sweet William' was well done by Mr. T. P. Cooke; though we could not but agree with a critic at our elbow, that 'he piped his eye too much.' The piece, indeed, throughout was well calculated to put one in 'the dumps.'

POPULAR SCIENCE.

'How charming is divine philosophy!
Not harsh and crabbed as dull fools suppose,
But musical as is Apollo's lute.'—*Comus*.

I.—ANIMATED NATURE.

'And God said, let them have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth, and over every creeping thing.'—*Genesis*.

1.—CHROMATOLOGY.

Colour of Hydrophytes.—At a depth of nearly 200 feet, on reaching the latitude of the Canaries, Humboldt and Bonpland drew up that singular *Caulerpa* with vine-shaped leaves, the beautiful green colour of which proves that the coloration of vegetables may take place in some instances, without exposure to intense light, usually supposed indispensable. It was at the depth of about 500 feet near Lewin's Land, that Mangé and Péron brought up, by means of a drag, specimens of *Retepora*, *Sertularia*, *Isis*, *Gorgonia*, *Spongia*, *Alcyona*, and *Ulva*, glittering with phosphoric light, which emitted a sensible heat. It was at a depth of about 600 feet, that, between the Isles of France and Madagascar, a hard tuft of *Sargassum Turbinatum* in every respect like that which is collected on the shore, was picked up. In fact, it was at a depth of nearly 1100 feet in the seventy-ninth degree of northern latitude, and eighty miles from the coasts of Greenland, that a whaler uprooted that extraordinary polypus, figured by Ellis (Act. Angl. 48. p. 305. T. xii.; and Corall. tab. 37,) and which became the *Pennatulæ Eurcinus* of the *Systema Naturæ* (xii. t. 1. p. 3867); an animal six feet long, gigantic in its tribe, a living umbrella formed from hydras, which shone with tints of the most beautiful yellow; which is another proof, that an organised being may be coloured without the participation of light, unless it be admitted that the rays of light penetrate through the depths of the watery abyss. If any naturalist should ever attempt to discover the truth, in such a case we should wish him by no means to neglect the examination of the colour of certain marine productions which have vegetable existence, whether they partake of animality or not in covering themselves with polypi, or whether they invariably remain in the state of plants. The tentacula of those actinia, which their changing beauty has caused to be called by the name of *Sea-anemones*, but which we call *Iridea*, *Padina pavonized*, and *Cystocera*, produce the effect of a prism, and on the surface of the waters spangle with the colours of the rainbow; there appear the delicate carmine and azure blue of the *Medusæ*, the appendices of *Porpites*, of *Thalia*, and *Glaucus*, whilst *Beroë*s and *Amphinoma* agitate their glittering tentacula. Below this almost superficial zone, through which each sort of luminous ray must penetrate to decompose and strongly colour bodies, appeared a multitude of *Florid*, in which the red with the purple pass to all shades, as well as the coral like blood, which begins with this zone. The tender green, which adorns *Ulva* and *Conferva*, lives indifferently on the surface of marshes, or at the great depth in the sea at which it has been found on *Caulerpa vitifolia*. The yellowish brown, which has been more observed to be of a superficial nature, by the appearance of moist species of the genus of *Lichina*, adhering to the sides of river rocks, cast up by the foam of waves during the tide, continues in that state below the region of verdure, since imprinting its monotony on the greater part of *Fucacea*, *Spongia*, and *Sertularia*, it has been observed in a *Sargassum*, which was growing at a depth of 600 feet. The pure yellow, which is not found in the higher regions, is only seen lower down, where, at a depth of 236 fathoms, it taints the *Pennatulæ Eurcinus*, the *Umbellulæna Greenlandica* of Lamarck.—*M. Bory St. Vincent*.

2.—DENDROLOGY.

Cedars of Lebanon in England.—Some cedars which have been planted in a soil well adapted to them, at Lord Carnarvon's, at Highclere, have grown with extraordinary rapidity. Of the cedars planted in the Royal Garden at Chelsea, in 1683, two had, in eighty-three years, acquired a circumference of more than twelve feet, at two feet from the ground, while their branches extended over a circular space of forty feet in diameter. Seven-and-twenty years afterwards, the trunk of the largest one had increased more than half a foot in circumference, which is probably more than most oaks of a similar age would do during an equal period. The surface soil in which the Chelsea cedars thrive so well, is not by any means rich; but they seem to have been greatly nourished from a neighbouring pond, upon the filling up of which they wasted away.

Various specimens of the cedar of Lebanon are mentioned as having attained a very great size in England. One planted by Dr. Uvedale, in the garden of the manor-house at Enfield, about the middle of the seventeenth century, had a girth of fourteen feet in 1789; eight feet of the top of it had been blown down by the great hurricane in 1703, but still it was forty feet in height. At Whitton, in Middlesex, a remarkable cedar was blown down in 1779. It had attained the height of seventy feet: the branches covered an area one hundred feet in diameter; the trunk was sixteen feet in circumference at seven feet from the ground, and twenty-one feet at the insertion of the great branches twelve feet above the surface. There were about ten principal branches of limbs, and their average circumference was twelve feet. About the age and planter of this immense tree its historians are not agreed, some of them referring its origin to the days of Elizabeth, and even alleging that it was planted by her own hand. Another cedar at Hallingdon, near Uxbridge, had, at the presumed age of 116 years, arrived at the following dimensions:—its height was fifty-three feet, and the spread of the branches ninety-six feet from east to west, and eighty-nine from north to south: the circumference of the trunk, close to the ground, was thirteen feet and a half; at seven feet, it was twelve and a half; and at thirteen feet, just under the branches, it was fifteen feet eight inches. There were two principal branches, the one twelve feet and the other ten feet in girth. The first, after a length of eighteen inches, divided into two arms, the one eight feet and a half, and the other seven feet ten. The other branch, soon after its insertion, was parted into two of five feet and a half each.—*Library of Entert. Knowledge—Trees.*

3.—XUENOLOGY.

Fancy Woods.—The following is a description of a few of the woods extensively used in ornamental cabinet-work, which we have taken from a very interesting chapter in 'The Library of Entertaining Knowledge,' just published.

Zebra-wood is the produce of a large tree, and we receive it in logs of two feet wide. It is a cheap wood, and is employed in large work, as tables. The colour is somewhat gaudy, being composed of brown on a white ground, clouded with black, and each strongly contrasted, as its name imports, derived as it is from the colours of the zebra.

Coromandel-wood is used in large works, like zebra and rose-wood. It is inferior to rose-wood in the brilliancy and division of its colours, having a dingy ground, and sometimes running into white streaks. The tree which produces it, is of a large size.

Satin-wood is well known for its brilliant yellow colour, with delicate glowing shades. It is now not much used in cabinet-work. The timber arrives here in logs of two feet wide, and seven or eight feet long.

Santal-wood is of a light brown colour, with brilliant waves of a golden hue, not unlike the finest Honduras mahogany. It is about the same size as satin-wood.

Amboyna-wood is now very much used in cabinet-work. It is of various colours; and the shades are generally small. It arrives in logs of two feet wide.

Botany Bay Oak forms very beautiful furniture. The ground is a uniform brown, with large dark blotches.

Ebony.—Of the several cabinet-makers' woods bearing this name, there are the African cliff ebony, which is black, with a white spot; and the spotted ebony, a very beautiful wood, and extremely hard, (more so than the common ebony,) of which the ground is black, with brown and yellow spots.

Acker-wood is the produce of a large tree, and is of a cinnamon colour. *Canary-wood* is of a golden yellow.

Purple-wood, which has been lately introduced, is of a purple colour, without veins. This appears to be the produce of a thorn of tropical countries, being only four inches wide. These three woods have been little used in furniture, but have been lately employed in mosaic floors, of which there are two now constructing at Windsor Castle, and at the Buckingham Palace. *Bird's-eye maple*, (its appearance is described in its name,) which has also been so employed, is a narrow and long wood.

Snake-wood is extremely hard, of a deep red colour, with black shades. It is principally used for bordering and small work.

Harewood something resembles satin-wood in the arrangement of its waves; but its colour is different, being of a light brown ground.

Calamander-wood.—There is a very beautiful wood of this name, growing to the Island of Ceylon, which, when wrought into furniture, surpasses, we think, in appearance, any other we ever saw. We are surprised that it is not regularly imported into this country; all that is here, has been brought over by private gentlemen, returning from that colony, for their own use. The wood is very hard and heavy, and of singularly remarkable variety and admixture of colours. It is very difficult to describe this—nay, impossible to convey to those who have not seen it, an idea of the manner in which the shades run into one another. The most prevailing of these is a fine chocolate colour, now deepening almost into absolute black, now fading into a medium between fawn and cream colours. In some places, however, the latter tint is placed in more striking, though never quite in sudden contrast with the richest shades of the brown. The variations are sometimes displayed in clustering mottles, sometimes in the most graceful streaks. There is not, however, any thing in the least gaudy or fantastic in the general result. It certainly arrests the eye; but it is from the rich beauty of the intermingled colours, not from any undue showiness.

This wood takes a very high polish. It is wrought into chairs, and particularly into tables. Nay, we have seen large folding doors made of it. The late Governor of Ceylon, Sir Robert Brownrigg, brought over large quantities of this remarkable product of that country; and in some additions he has made to his house in Monmouthshire, he has had the doors of his dining-room constructed of calamander. The effect is peculiarly happy.

4.—ANTEDILUVIAN BOTANY.

Nature of Vegetation at different Epochs of the Crust of the Globe.—M. Adolphe Brougniart, has published an interesting paper upon this subject in 'The Annales des Sciences Hist. Nat.' for November, in which he divides the time of the formations into four periods; viz.

1. The immense numerical predominance of vascular Cryptogamia, that is to say, Félices, Characæ, and Lycopodiæ; and the great development of these plants, are the essential characteristics of the first period.

2. The numerical equality of vascular Cryptogamia, of gymnospermatic Phanerogamia, represented by the Conifera and Monocotyledones, as well as the least development of the vegetables of the first of these classes, appear to be the essential marks of the second period.

3. The third period is particularly distinguished by the predominance of gymnospermatic Phanerogamia, and particularly of Cycadæ; the vascular Cryptogamia hold the second rank, and then an inconsiderable number of Monocotyledones succeed.

4. Lastly, the fourth period presents us with vegetables of all the classes at present existing; among which, as at this epoch, Dicotyledones are by far the most numerous; then Monocotyledones, gymnospermatic Phanerogamia, and last of all, Cryptogamia, and Agamia.

Newcastle Legend.—Sir Francis Anderson, Mayor of Newcastle in 1559, standing on the bridge, probably to see the troops pass by which had been sent by Queen Elizabeth to resist the Scottish Lords, he chanced to drop his ring into the Tyne. Some time after, one of his servants accidentally bought a fish in the market, in the body of which was found the identical ring which had been dropped. M. Brand, from whose history of Newcastle this story is taken, affirms that he has seen this ring in the possession of a descendant of the family, and adds, that Mr. Anderson has a family deed, prior in date to the above-told event, with the impression of the same seal on it. The engraving on the signet appears to be a Roman antique.

VARIETIES.

DEATH OF SIR HUMPHRY DAVY.—The name of this distinguished philosopher, it is now certain, is to be associated with those of the two other celebrated Englishmen, benefactors of science, who have departed from the theatre of their labours in the course of the last six months. Even as one of a trio so illustrious, if the important results which attended his scientific observations alone be considered, Sir Humphry Davy must be undoubtedly regarded as pre-eminent. To him the scientific world is principally indebted for its acquaintance with the powers and properties of the Voltaic battery; while his discoveries of sodium and potassium, and the invention of the Safety-lamp, are deservedly classed among the most valuable presents which philosophy ever made to art, and will not fail to transmit his name to posterity. The removal from amongst us of so eminent a man, however complete his career, cannot fail to excite melancholy feelings. He died at Geneva, on the 29th of May; and every honour was paid to his remains by all the residents of that city in any wise distinguished either in science or literature.

CHILD WITH TWO HEADS LIVING.—At the sitting of the *Académie des Sciences*, of the 25th of May, M. Geoffroy-Saint-Hilaire presented the drawing of a monstrosity living at Turin in the early part of March. The object was a girl with two heads. The lower parts only were in common; the upper part was separate, and presented the ordinary conformation. The priest, regarding this being as two distinct individuals, baptised them separately, the one by the name of Riitta, the other by that of Christina. They were born at Sassari, in Sardinia, in the beginning of the year; their size is that of an infant borne the full time by the parent. The French journal, 'Le Globe,' in reporting the proceedings of this sitting, enumerates the following instances of similar monsters which have lived to a considerable age. Under the reign of James III., King of Scotland, says Buchanan, there lived a man double from the naval upwards: single below that region. The King had him brought up with care. He made great progress in music. The two heads learnt several languages; they disputed with each other, and the two upper parts sometimes even fought; but in general they lived as good friends. When the lower part of the body was pricked or tickled, both the upper individuals were sensible to the operation at the same time. But, on the contrary, when the upper part of one individual was touched, the other remained insensible. This being died at the age of twenty-eight years. One of the bodies survived the other several days. In 1723, M. Martinez saw, at Madrid, a man with two heads, who was shown for money. Siebert, also, relates having seen an infant double in the superior part; single below. The one only ate. The two often quarrelled and fought. The one survived the other four days.

PRIZES OF THE FRENCH ACADEMY OF SCIENCES.—The question proposed by the French Academy of Sciences, for the Alhumbert prize of twelve thousand francs, was the following:—'To show in a complete manner, by means of drawings, the changes undergone by the skeleton and muscles of frogs and salamanders, at different periods of their life.' The Committee charged with the examination of the essays which should be sent in reported on the 25th of May, that there were no candidates for the prize, which appeared the more extraordinary, as the question did not seem to present any great difficulty. It was inferred that the time allowed for sending in the Memoirs had been too short, and it was agreed to renew the question, and to give two years' time for answering, with an addition of 300 francs to the prize, which is now consequently, 1,500 francs. The Memoirs to be sent in, at latest, on the 1st of April, 1831.

At the sitting of the 1st of June, a prize of 2,000 francs was awarded to the author of an essay on the following subject, proposed by the Academy: 'The general and comparative history of the circulation of the blood, in the four classes of vertebrated animals, before and after birth, and at different ages. The prize offered was 3,000 francs, but the Committee did not consider the memoir worthy of the entire sum, and the lesser was granted by way of encouragement.

LOUIS XIV. AND BEDLAM.—Old Bethlem, in Moor Fields, was built on the plan of the Royal Palace of the Thuilleries, at Paris, which imitation gave such offence to the Grand Monarch, Louis XIV., that he ordered the plan of St. James's Palace to be taken for an office that shall be nameless! The present hospital is a noble pile of building erected on the site of the once cele-

brated DOG AND DUCK TAVERN,—a curious revolution, from scenes of voluntary madness excited by wine, to the straight-waistcoat and solitary cell of the present colony of maniacs!—and is capable of containing 200 patients of both sexes, besides two wings for criminals, supported by Government, and calculated to accommodate sixty more.

THE REV. DR. PERNE.—Dr. Andrew Perne, was a man of wit and learning, bred at Peter-house, Cambridge, of which college he became at length master, as well as Vice-Chancellor of the University. Although he changed his religion four times in twelve years, he yet was beloved steadfastly by the Protestants, as his interest was exerted to save many from the flames. His turn was extremely sarcastical. He had once chanced to call a clergyman a fool. The irritated priest threatened that he would complain to his Bishop. 'Go to your Bishop,' replied the bitter Perne, 'and he will confirm you.' A jest is said at length to have cost the Doctor his life. Elizabeth, at the close of her reign, increased in pettishness and obstinacy. She would ride out in the rain in spite of the humble entreaties of her maidens; and the only hopes they had of stopping her was to set her buffalo, Clod, to laugh her out of it. 'Heaven dissuades you, Madame,' in the person of Archbishop Whitgift, and earth dissuades you in the shape of your fool, Clod; and, if this will not serve, at least attend to the dissuasions of Doctor Perne, who has long been suspended in religious doubts between heaven and earth.' The Queen applauded the joke, but the Doctor sank under it, accompanied his patron, Dr. Whitgift, to Lambeth, and very soon after expired.

QUEEN ELIZABETH.—The humiliating idea of dying childless inspired Elizabeth with a transient spirit of coquetry, which probably made her smile on many adorers. Besides Lord Robert Dudley, the Earl of Arundel presumed on the antiquity of his family; Sir William Pickering on his person; and the Earl of Arran on his relation to the crown. Several foreign princes, too, among whom were Eric, King of Sweden, and Adolphus, Duke of Holstein, paid their tribute of admiration to Queen Elizabeth as suitors; and none met with a positive refusal.

Elizabeth, during the reign of Mary, had refused the offer of this son of Gustavus Vasa, in so prudent a manner as to extort praise even from the lips of her ill-disposed sister. This princely wooer had paved his way to the fair queen by sending to her a royal present of eighteen large pyed horses, and two ships laden with riches. (*Strype, Annals.*) There was a diverting perplexity as to the method of receiving this prince at court, from the prudish idea of 'the Queen's Majesty being still a mayde.' (*Warton from Burghley.*) The costly method in which Eric carried on his suit, was a matter of serious concern to the Senate of Sweden.

EDWARD VI.—Fuller, speaking of this excellent young prince, says, 'no pen passeth by him without praising him, though none praising him to his full deserts;' and William Thomas, who was much about his person, thus describes him: 'Alas! if you knew the towardness of that young prince, your hearts would melt to hear him named, and your stomachs abhorre the malice of them that would use him ill: the beautifullest creature that liveth under the sun, the liveliest, the most amiable, the gentlest thing in all the world; such a spirit of capacie in learning the things taught him by his schoolmasters, that it is a wonder to hear say: and finally, he hath such a grace of porte and gesture in gravitie, when he cometh into any presence, that it should seeme he were already a father! and yet passeth he not the age of ten yeares, a thing undoubtedly much rather to be seene than believed. Alas! (quoth I,) nay, alas! agayne, what crueltie should move these ravening dragons to covet the devouring of so meek and innocent a lamb with the sedition of such devilish rumours!'

[*Advertisement.*]—A number of extraordinary cures in cases of rheumatism, gout, lumbago, sciatica, erysipelas, and eruptive complaints, have lately been effected by the means of Mr. Green's baths, in Great Marlborough-street, London, the use of which is strongly recommended by Sir Henry Hallford, and all the leading medical men in the kingdom. A gentleman of the first respectability in this neighbourhood, who will bear testimony to the great utility of these baths, requests us to make this mention of them in our papers for the benefit of invalids. Mr. Green has published a pamphlet on the subject of his baths, in which he relates numerous astonishing, but, at the same time, well authenticated, cases of successful treatment. Mr. Green, it appears, is in the daily habit of directing hot air, sulphur chlorine, aromatic, and mercurial fumigations, together with vapour baths.—Copied from 'The Salisbury and Winchester Journal,' June 8, 1829.

THE MINER'S BRIDE.

THE life of a miner is very laborious and very different from that which we lead,—we that are used to enjoy the dazzling light of the sun, to be revived by the warmth of his beneficent rays, and who look upon the varied pictures which nature is continually producing. Scarcely can we form any conception of the miner's subterraneous existence! Hardly can we imagine that, to furnish the demands of our trade or of our luxury, a multitude of men should be condemned to pass a part of their lives—some even the whole—in the bowels of the earth, lighted only by the pale glimmer of a lamp, and exposed to every species of danger.

Nothing is more horrible at first sight than their lot! But such is the force of habit, that the miner seldom thinks of regretting during the days of labour that which he can enjoy only on days of festivity and repose. From his laborious, retired, and frugal life, there arise to him virtues which make him love life and bless Providence. His vocation falls to him by inheritance, and he adopts it on the same grounds as the Laplander prefers to the most pleasant and fertile countries, the eternal snows and sterile heaths of his clime, and the gloomy, smoky hut where he received existence.

The miner executes his task with a persevering regularity that diminishes its weight, paying to his superiors a cheerful submission so long as the spirit of justice dictates their commands, and observing toward the strangers who venture to explore his deep laboratory, a simple and respectful politeness, and an ingenious solicitude to preserve them from fatigue and danger. It was in the dark scene of their manipulations that I studied their manners; and when I had quitted the surface of the earth which was then lighted by the melancholy rays of the moon, and plunged rapidly into the hole of a pit of more than 700 feet deep, it appeared as though I was entering a new state of existence. Braving the fatigue, I traversed in all directions those long sinuosities by which human industry extends its conquests. Bending over the rocky coal, I also handled the pick-axe and the spade, and could thus calculate the efforts to which a miner is condemned in tearing from the earth's bowels those materials which yield him only a very moderate recompense. In the intervals of repose, while seated amidst these sable people, I was pleased to hear them conversing without restraint, and their simple confidence did not disappoint my eager curiosity. There did I hear the song of gaiety and the accents of love—for the miners have also their bards and minstrels; and there I saw men entirely satisfied with their lot.

It was in a village in the north of France. There, amid a population wholly occupied in the labours of the mines, lived Pierre and Margaret. Pierre was the son of a captain of the mines. Hardly had he learned to walk, when he ran to the pits; where he descended, and by his infant wiles lightened the labours of his father. Afterwards, when the innocent looks of infancy were exchanged for the more decided features of adolescence, Pierre became a good workman, and next to his father was most capable of directing the works. He would indicate the point at which the miner might sink without fear of disappointment: he would traverse without any deviation the long subterraneous passages; and, incapable of terror in the darkness, he used gaily to explain by natural causes the mysteries with which his companions were wont to frighten one another. He alone did not tremble at the mention of that scourge of the deep mines, that terrible explosion, of which the most experienced miner cannot hear the name without a secret horror.

One evening, as Pierre's father was returning from a neighbouring village, he heard groans. He was a feeling man, and always attended to the cries of distress. He stopped and searched the underwood which hedged in on both sides the

road which he was travelling. What was his surprise! An infant, covered with a few rags, was struggling on the grass, and lifting up its little hands towards heaven, as if it was imploring succour. The tears coursed down its pale cheeks, and the hoarse sound of its voice plainly evinced that for some time past hazard or desertion had thus left it to the compassions of the passers-by.

The old miner felt his heart burst at this unexpected sight. He thought of his son, his own dear Pierre; and he quickly stooped down to the poor foundling. As if it could take consolation from his words, he spoke to it, promised it his support; and, all the while endeavouring to soothe it, he collected the tatters which defended it from the inclemency of the air, folded it in his leathern apron, and carried it away with many kisses and constant efforts to appease it.

'Wife,' said he, opening the door of his house, 'guess what sort of present I bring thee! Providence has selected us from all the inhabitants of the village to take charge of a deserted one. Thou wilt approve of what I have done, I am very sure.'

Pierre's mother answered by giving her hand to her husband. Then she learnt by what chance this pretty little girl had come to her house, and regarded it as her own child. Thus was Margaret restored to life, and provided with a family, after having lost all, and being apparently, destined as a prey to voracious animals.

Now the children grew up; and, as they were always together, felt a mutual desire to please, and loved each other with much tenderness. The names of brother and sister which they had given one to the other, were succeeded by titles more endearing. They read each other's heart, and indulged in day-dreams of the felicity of a future which they did not know; and Pierre asked his father to give him Margaret for a companion. This was what their parents wished. How did their hearts rejoice when Pierre's father said to them, 'Fix for yourselves the day of your happiness!'

This was very soon; and they were so loved, they merited so well to be so, that the day of their nuptials was made a general holiday! Labour suffered a pause; the mines were forsaken; tables were spread; nosegays adorned the corsets of the maidens and the buttonholes of the youths. The air rang with the voice of joy and the notes of the instruments which regulated the motions of the dancers assembled on the green-sward.

But, behold! in the midst of the rejoicings, Pierre was observed tenderly to embrace his beautiful bride. Afterwards, he said in a whisper to his young companions, 'Hold there; this is the time to surprise her, and now I will make her the presents.' He was then seen to dart laughing away, with his finger on his mouth, as an injunction of secrecy. He turned round the corner of the house, appeared to take a devious track leading to some former mines, and then—Pierre returned no more. He came not at eventide—he came not on the morrow. They sought him, they called for him, they expected him. Three days, four—eight days, a month, a year rolled by; but Pierre never came! On the wedding-day, as soon as his continued absence was perceived, the sports were suspended. The bride wept, and wrung her hands. The miners, led on by Pierre's father, traversed all the passages of the mines, and left no place where man could come unexamined: but nothing, no nothing, appeared to afford them the hope of discovering even the least remain of their companion—their friend.

Margaret had well nigh died! She became reconciled to life only that she might consecrate it to the father and mother of her Pierre, they were so much to be pitied! She, alas!—but gratitude gave her supernatural courage—she took off her bridal ornaments, and, as she put them carefully by, said within herself, 'I will wait for his return!'

(To be continued.)

LIST OF BOOKS PUBLISHED DURING THE WEEK.

Richardson's Zoology of the Northern Parts of British America, 4to., 11. 11s. 6d.
 Brande's Geology, 2nd edition, post 8vo., 7s. 6d.
 Sumner's Sermons, 8th edition, 8vo., 10s. 6d.
 Nine Lectures on the History of Peter, by the Rev. H. Blunt, 12mo., 4s. 6d.

Sun.	14.75	73	30.14	S.W.	Ditto.	Cirro-cum.

Nights and mornings fair. Mean temperature of last week, 63°.
 Highest temperature at noon, 81°.

Astronomical Observations.

The Moon in Apogee on Monday.
 Mercury at his greatest elongation on Monday.
 Jupiter's geocentric longitude on Sunday, 8° 45' in Sagitt.
 Saturn's ditto ditto 20° 10' in Leo.
 Sun's ditto ditto 23° 4' in Gemini.
 Sun above the horizon on Sunday, 8h. 33min. Day increased 8 h. 48m. No real night.
 Sun's hor. motion on Sunday, 3' 22" plus. Logarithmic num. of distance, .06692.

This day is published, the fourteenth edition, price 8s. boards, **ILLUSTRATIONS of MASONRY.** By the late WILLIAM PEARSON, Esq., Past Master of the Lodge of Antiquity, acting by Immemorial Constitution. With important additions, alterations, and improvements. By the Rev. G. Oliver.
 Printed for Whittaker, Treacher, and Co., Ave-Maria-lane.

This day is published, in a neat pocket volume, the sixth edition, corrected and considerably enlarged, with Views and Maps, price 8s. bound, **THE CAMBRIAN TOURIST; or, Post-Chaise Companion through Wales: containing Cursory Sketches of the Welsh Territories, and a Description of the Manners, Customs, and Games of the Natives.**
 Printed for Whittaker, Treacher, and Co., Ave-Maria-lane.

A MIDSUMMER PRESENT.

This day is published, in foolscap 8vo., with a coloured Presentation Plate, price 5s., in extra boards, **THE ANTHOLOGY; or, Annual Record** Book for Youth; consisting of Amusing and Instructive Selections from the best Authors.
 I. Curiousities in Zoology, Botany, &c.
 II. Tales, Apologues, and Anecdotes.
 III. Voyages and Travels.
 IV. Moral, Eloquent, and Miscellaneous Extracts.
 V. Poetry.
 Printed for Whittaker, Treacher, and Co., Ave-Maria-lane.

On the 1st of June was Published, Price only 2s. 6d.
 Part VII. of

THE EXTRACTOR; or, Universal Repertorium of Literature, Science, and the Arts. The present Part contains—Travels in Arabia—Effects of Galvanism on the Animal Structure—Songs of Burns—Temple of Ypsamboul—The new Colony on the Swan-river—Coast Lights on a new principle—The two Emiles—Exemption of Operative Tanners from pulmonary consumption—Rice Paper—Wilkie the Painter—Mr. R——d's Dream—The Court of Napoleon—Description of Jerusalem—The Cause of Dry Rot Explained—Recollections of a Night Fever—Convent of St. Bernard—The Emperor of Austria—Transplantation of Growth Timber Trees in Phrenology—Steam Navigation—Beet Root Sugar—Gastronomy—Ticks in Animals—Opium—Dr. Chalmers—The Baron of Arnheim—The Waverly Novels—English Paper—Rules for Connoisseurship in Painting—French Criminal Trials—Captain Owen's Plan for Rating Chronometers—Visit to the American President, Jackson—Mountain Storms and Slides in America—Origin, Nature, and Number of Sutures—Poisonous effects of Fresh Water on some Marine Animals—The Editor in his slipper—The first and last Kiss—Modern Jewish Customs—Principles of Teaching—Public Records—The Proverbs of Solomon—Three Years at Cambridge—Wits and Authors—Cavalry Tactics—Dogs—Remember Me—Varieties, &c. &c.
 Published at 'The Extractor' Office, 156, Fleet-street; and may be had of all Booksellers.

NATIONAL REPOSITORY, Gallery of the Royal Mews, Charing-Cross. Patron—The King.—The EXHIBITION is NOW OPEN daily.—Admittance, 1s.; Catalogues, 1s.
 T. S. TULL, Secretary.

THE GALLERY of the SOCIETY of PAINTERS in WATER COLOURS, Pall-Mall East, WILL CLOSE, for the present Season, on Saturday the 27th instant.—Admittance, 1s.; Catalogue, 6d.
 CHARLES WILD, Secretary.

COLONEL TOD'S HISTORY OF RAJPOOTANA.

Dedicated, by permission, to his Majesty.
 Nearly ready, to be published in about a fortnight, in 1 vol., royal 4to., illustrated with an original Map, Genealogical Tables, and nearly thirty superior line Engravings, by Finden, Storer, and Haghe, from Designs taken on the spot.

THE ANNALS and ANTIQUITIES OF RAJASTHAN, or the Central and Western Rajpoot States of India. By Lieut.-Colonel JAMES TOD, late Political Agent to the Western Rajpoot States.

The entire work will consist of two volumes; the present volume contains a Geographical Sketch of Rajpootana, History of the Rajpoot Tribes, Sketch of a Feudal System amongst the Rajpoots, Annals of Mewar, Religious Establishments, Festivals and Customs of the Rajpoots, and the personal Narrative of the Author.

N.B. This volume will form a complete work in itself. Specimens of the Engravings may be seen at the publishers', Smith, Elder, and Co., 65, Cornhill; and Calkin and Budd, 118, Pall-Mall.

On the appearance of the work, the original designs will be shown to the public as above.

CAMBRIDGE UNIVERSITY ELECTION.

AT a MEETING held in Trinity College, at one o'clock, on Monday, June 1, 1839, it was agreed that the following Notice should be circulated among the Members of the Senate:

'On the probable vacancy in the Representation of the University, we, the undersigned, beg leave to submit to the Members of the Senate the following considerations respecting Mr. Cavendish.

'It can rarely happen that we should have an opportunity of returning a Member so qualified in every respect for the representation of the University. He has adorned a hereditary connection with science by his own eminent talents and attainments. During the whole of his residence among us, his conduct was according to the true spirit of our institutions: his situation and his disposition are such, that we feel confident the fulfilling of the duties of such a station, and promoting the welfare of literature and science, will form the main object of his life, and that he will become closely identified with the interests and feelings of the University.

'We, therefore, beg leave to inform the Members of the Senate, that on those grounds we intend to put Mr. Cavendish in nomination on the day of Election, in the earnest hope that the opinions we have now stated may be then honoured by their approbation and support.

J. LAMB,

'Master of Corpus Christi College, Chairman.'

Wm. Smyth, Professor of Modern History, St. Peter's College.
 J. Henslow, Professor of Botany, St. John's College.
 G. B. Airy, Plumian Professor of Astronomy, Trinity College.
 J. Cumming, Professor of Chemistry, Trinity College.
 T. Musgrave, Lord Almoner's Professor of Arabic, Trinity College.
 W. Whewell, Professor of Mineralogy, Trinity College.
 Geo. Pryme, Professor of Political Economy, Trinity College.
 Townley Clarkson, Jesus College.
 William Jones, Fellow and Senior Dean of St. John's College.
 J. Bowstead, Fellow of Corpus, and Moderator.
 T. S. Hughes, late Fellow of Emmanuel College.
 J. Lodge, Fellow of Magdalene College, and Librarian of the University.
 Martin Thackeray, Vice-Provost of King's College.
 R. Dawes, Fellow and Tutor of Downing College.
 Marmaduke Ramsay, Fellow and Tutor of Jesus College.
 Joseph Romilly, Fellow of Trinity College.
 J. C. Hare, Fellow of Trinity College.
 George Peacock, Tutor of Trinity College.
 T. G. Hall, Fellow and Tutor of Magdalene College.
 C. T. Lirlwall, Fellow of Trinity College.
 H. Coddington, Fellow of Trinity College.
 H. Arlett, Fellow and Tutor of Pembroke College.
 F. Malkin, Fellow of Trinity College.
 W. J. Bayne, Fellow of Trinity College.
 J. A. Jeremia, Fellow of Trinity College.
 J. Chailis, Fellow of Trinity College.
 S. W. Waud, Fellow of Magdalene College.
 T. Worsley, Fellow and Tutor of Downing College.
 C. Currie, Fellow of Pembroke College.
 J. A. Barcus, Fellow of Trinity College.
 S. Tennant, Chaplain of Trinity College.
 J. S. Upton, Trinity College.
 T. Thorpe, Fellow of Trinity College.
 T. Riddle, Fellow of Trinity College.
 Ralph Blacklock, Fellow of Catharine Hall.
 R. Wilson, Fellow of St. John's College.
 L. Stephenson, Fellow of St. John's College.
 T. Dicks, Fellow of Jesus College.
 H. Battiscombe, Fellow of King's College.

At a Meeting of the Members of the Senate resident in London, held this day at the British Coffee-House, Cockspur-street, Professor Babbage in the Chair;

It was resolved,—That this Meeting fully concurs in the sentiments expressed by the resident Members of the University in favour of Mr. Cavendish, and does hereby express its cordial approval of their intention to put him in nomination, and its determination to support him at the Poll.

June 2, 1839. CHARLES BABBAGE, Chairman.
 Since the passing of the above Resolution, Mr. Cavendish has declared himself a Candidate, and is gone to Cambridge.

Published this day, in 12mo., containing above 550 closely-printed pages, price only 7s. 6d. boards, the fourth edition, revised and enlarged, of

THE COOK and HOUSEWIFE'S MANUAL:
 A Practical System of Modern Domestic Cookery and Family Management, containing a Compendium of French Cookery, and of fashionable Confectionary, Preparations for Invalids, a Selection of cheap Dishes, and numerous useful Miscellaneous Receipts in the various Branches of Domestic Economy. By Mistress MARGARET DODS, of the Cleikum Inn, St. Ronan's.
 Published by Oliver and Boyd, Edinburgh; and Simpkin and Marshall, London.

EXHIBITION of DRAWINGS, by J. M. W. TURNER, Esq., R.A., consisting of VIEWS in ENGLAND and WALES, executed for a Work now in course of publication, at the Large Gallery, Egyptian Hall, Piccadilly.
 Admittance, by Tickets only, which may be obtained (gratis) of the publisher, Mr. Jennings, 2, Poultry; at the Gallery; and at 332, Oxford-street.
 Open from Ten till Six.—Subscribers' names received at the Gallery.

TO AMATEURS and PROFESSORS OF THE FLUTE.
MESSRS. RUDALL and ROSE, whose attention has been for several years devoted to the improvement of the Flute, and whose exertions have been rewarded by the approbation of the most accomplished Amateurs, as well as of the most distinguished Members of the Musical Profession, beg to inform the Nobility and Gentry, that they have on hand a large stock of Wood, which has for some years undergone the process of seasoning; and that they can confidently recommend the Instruments made from this well-prepared material, as being secure against any injury from the distillation of the breath, or the vicissitudes of climate.—No. 15, Piazza, Covent-Garden.

'Among the numerous improvements which have of late years distinguished musical science, it may be mentioned that Messrs. Rudall and Rose, of Covent-Garden, have brought the Flute to a state of perfection, which leaves nothing more to be desired. In point of power and brilliancy of tone, in the extreme neatness and elegance of their mechanical properties, but more particularly in their well-known capability of withstanding the changes of all climates, their Flutes surpass any thing of the kind that has hitherto been offered for public approbation and support.'—*Athenæum*, Nov. 26, 1838.

IMPROVED TERRO-METALLIC TEETH.

MR. HOWARD, 52, Fleet-street, (removed from 33,) having brought to perfection an important improvement in TERRO-METALLIC TEETH, respectfully solicits the attention of the Nobility and Gentry to his new method, which he is confident will be found on investigation to be far superior in natural appearance and durability to any ever before produced in England. They perfectly restore the articulation and mastication, and are not to be distinguished in any respect from the original teeth.—52, Fleet-street. At home from 10 till 4.

TERRO-METALLIC TEETH.

MR. A. JONES, Surgeon-Dentist, 43, New Bond-street, begs to acquaint the Nobility and Gentry, that, from many years' intense application, he has invented and brought to perfection, a New System of Fixing TERRO-METALLIC, NATURAL, and ARTIFICIAL TEETH, from one to a complete set, which are so accurately fitted as not to be distinguished from the original, and answer all the purposes of mastication, articulation, &c.—Mr. A. J. continues stopping decayed teeth with his unrivalled Anodyne Cement, which in one minute allays the most excruciating pain; and by this means carious teeth are wholly preserved and rendered useful, even if broken close to the gums. This being a metallic composition, it becomes hard as enamel in a few minutes, will not decompose with the heat of the stomach, and resists the effects of acids, atmospheric air, &c.—Cleaning, and every operation incidental to Dental Surgery.—At home from ten till five.

A. ROWLAND and SON respectfully solicit Ladies and Gentlemen, on purchasing MACASSAR OIL, not to take any without being enclosed with a pamphlet in a wrapper, the label having the words, 'Rowland's Macassar Oil,' and sealed at each end, with the name and address, and signed on the label in red, 'A. Rowland and Son, 25, Hatton-Garden,' and countersigned, 'Alex. Rowland.' Price 3s. 6d., 7s., 10s. 6d., and 21s. per bottle. All other prices, or without the wrapper, are counterfeits. A valuable supply of the Genuine Oil; also, ROWLAND'S KALYDOR, for the Skin and Complexion. Also, ROWLAND'S ESSENCE of TYRRE, for changing Red or Grey Whiskers, Eyebrows, &c., to Brown or Black; 4s., 7s. 6d., and 10s. 6d. per bottle. Also, ROWLAND'S ALSANA EXTRACT, for the Teeth-ache.

A valuable supply is just received by Mr. Smyth, Perfumer, 117, New Bond-street; R. Hendrie, Perfumer, Titchborne-street; Sanger, 150, Oxford-street; Delcroix, 158, Gattle and Pierce, 57, D. Rigge, 35, New Bond-street; Atkinson, 29, New Bond-street, and 44, Gerrard-street; Butler, 4, Cheapside; Bayley and Blew, Cockspur-street; Pater and Co., 37, Lombard-street; Berry and Lloyd, 18, Gresham-street; Low, 220, and Prout, 226, Strand; Burgess and Co., 68, Holborn-hill; Sutton, Bow Church-yard; Edwards, 67, Newbery, 44, St. Paul's Church-yard; Barclay and Sons, 95, Fleet Market; J. and T. Rigge, 65, Cheapside; Stradling, Exchange-gate; Nix, fronting the Royal Exchange; Talte, 41, and Johnstone, 68, Cornhill.

London: Printed and Published every Wednesday Morning, by WILLIAM LAWES, at the Office, No. 4, Wellington-street, Strand.

THE ATHENÆUM

AND

LITERARY CHRONICLE.

No. 87.

LONDON, WEDNESDAY, JUNE 24, 1829.

Price 8d.

AN AFTER-DINNER CONVERSATION.

'WELL, I am sorry to differ from you,' said the commission-merchant, seated in his red dining-parlour, at Highgate, after dinner, while the dusk was rapidly closing; 'I am sorry to differ from you; but I must say I would not give a button for fine landscapes, full of a sort of sun-light that scarcely ever shone. My taste is for pictures of old women and school boys playing tricks on one another, and people eating and drinking and laughing. I like to see, in painting, buttered toast and legs of mutton, and all that I have been used to.'

'Good heavens!' exclaimed the medical student, who was the commission-merchant's only guest, 'do you not see that it is the business of the fine arts to represent not the actual, but that which may be and ought to be. In the world of painting, all that we see around us lives again, but in its proper place, with reference to the absolutely beautiful. The trivial objects which we are usually conversant with become to us, in our actual life, the boundaries and standards of our minds. The painter, the true painter, he who alone is worthy of the name, does not destroy or overlook them; but between and above these petty obstructions he opens to us vistas of the distant and glorious, through which blow in on our souls the airs of Paradise. All that has ever at any time been wrought within us, is implied in the state of mind which enables us to understand and enjoy the master-pieces of the fine arts.'

'Nay, when you deny the existence of that higher and spiritual consciousness; which, if any works of man are to be precious and true, must needs be embodied in them, you deny that popular creed to which you pretend that you are willing to bind your faith. Have not, in fact, all nations, at all times, made for themselves an image of a brighter world, which hangs above the earth like a golden morning cloud over the misty prospect. And of what moment is it, if in some cases there has been a real field and foundation for this belief, unless you can give some reason why men should constantly have agreed to cherish these traditions more than others. They create for themselves a bright sphere with which they fill the past and the future, but which few are strong and wise enough to substantiate in the present.'

'Thus the Mohammedan looks back to Eden and forward to Paradise. He remembers, as if it had belonged to the personal consciousness of his childhood, the time when angels walked the earth; when the air was filled with visible genii, lords of pleasure and power, and dispensers of all the riches of the mines. And what else but this persuasion can have thrown consolation and light around the paths of the Turkman in his grassy waste, and over the bare deserts of the Arab. How would he have been led to live an exulting soldier and die in victory, but by seeing, when he turned his eyes from earth, the firmament opened, and the streams of heaven flowing in freshness, and the melodious trees waving their shadows round the maids who beckon to the expiring warrior. This vision was the talisman of Mohammed; and still, my friend, does it furnish energy and union to the nations of Islam.'

'Was the subtle and passionate Greek less devoted to a thought which, with its manifold and living beauty, relieved him from the dullness and deadness of the actual? In the earliest generations of that wondrous people, do we not know that the common eye was an eye of faith, which beheld the unchanging gods, and the spirits of rivers and of forests and of the sea moving among men, with as

vivid and corporeal a reality as themselves. They had not only a faith in distant orbs, and separate abodes of superior natures, but saw their deities by the very light of our earthly noon. Not only did Olympus throw its deiform shadow over the world, not only had they glimpses of that Atlantis which dwelled like a separate star among the lonely waters, but sea-nymphs moved before them along the sands; and gods, in glittering panoplies, marshalled their lines for the battle. They believed in these ethereal beings with the same simple and kindly faith, as in the trees and winds and mountains, the priests and queens, the broad ocean, and the ship, with its military crew, and the tall leader. Neither in after times, when they had begun to trade, and to doubt, more freely than before, (not that I think you are necessarily a sceptic, because you are a merchant,) did they lose their conviction of the existence of a life and value in their mythology. The deities mingled, indeed, no longer with mankind; but they remained as princes and sages in their own calm and distant sphere. A sacred light surrounded them. Change and trouble could not approach them. Their region was as a crystal globe, setting them apart for especial glory. Yet were they connected by their thoughts and attributes with humanity; and men who could not regard them as mixed or occupied with their trivial follies, might, nevertheless, behold in them serene friends and awful counsellors.

'If the Romans had not believed in gods, the greatness of their country would have been to them a religion. That country, not in its material existence, not at the hour in which they, as individuals, belonged to it, but as a thought, a power, a living, and organised being, with a history and a future, was to them the centre and purpose of all; and raised by their love for it above the mean and transitory concerns of the passing moment, they had a high vantage-ground, a stay, a hope, and a supremacy. Thus were they made wise and mighty, and thus did they come as princes and legislators to every land in which they set their feet.

'Look from these to the immense and wonderful kingdoms of the east. Neither have they, in their passive apathy, been able to rest satisfied, without creating for themselves a grotesque and monstrous world of beings, brighter and more powerful than men. And is not even that state of inaction, almost approaching to annihilation, which is the ideal of some oriental sects; is not even this an effort to give a higher form than any found in the outward system of things, to a longing and hope which they can but imperfectly satisfy in themselves?

'Or, leaving these speculations as to the times of antiquity and oriental countries, think for a moment of the history of Christian Europe. How strong has been the tendency to change our feet to wings. How earnest men's belief in that shining hierarchy of martyrs, saints, and angels up the degrees of which they might lift themselves to the foot of the eternal throne. By what strange influence was it that these visions became more familiar to men's minds, more necessary to their life than the physical elements of existence. Was not the whole spirit of Europe shaped and dyed, age after age, by these traditions and mysteries? And did not the imperious baron, in his blazoned hall, and the serf toiling in his woodland hut, alike find in these images, a twinkling gleam of the spiritual, the universal, and enduring?

'How powerfully also, and terribly, were principles deeper and more potent than our understandings can master, or our human will contend with, expressed and substantiated in the faithful rites of

witchcraft and magic, which wanted not, any more than the mere creations of the fancy, a certain strange and impressive beauty, and cloudy magnificence. The wizard's circle, on the heath, or in the cave-like ruin, was divided indeed from the field and the market, by superstitious terror and insane longing. But it was also set apart from the dreariness and waste of custom and mere selfish prudence, and within it walked, if no where else, shapes that attested man's possible superiority to a higher life than the animal.

'Nor was it only in the devices of churchmen, or in necromantic secrets, that the unsatisfied and high-reaching soul of man endeavoured to preserve and nourish its interior faith. Behold the peasant, beaten and famished, quaking with dread of his master, and scowling the menace of revenge, reduced almost to the degradation of the wretched dog or labouring horse, yet keeping in his withered heart one spot of living green, haunted by the silver footsteps of the fairies, and all its wild flowers trembling, while they are fanned by hovering wings of tiny angels. Through the wintry chinks of his hovel, or among the branches of the gloomy wood, he looks at some moments of his weary life with joy and confidence, at the jewels on the cloaks and crowns of dancing elves; and through the mournful and ruinous passages of his soul tinkles the fairy music, and tells him that he has still a spirit formed to converse with the lovely, the cheerful, and the innocent. He gazes with faith and hope, and the merry phantoms become more numerous and more eager; they whirl around him in a dance of wild and infant-like rejoicing; one leaps with laughable gestures in the air; another wheels and darts like a dragon-fly over the water; here, in a ring, the little female genii circle and toy with the gallant elves; and, drinking honey-dew under a grove of fern, a train of glow-worm spirits chime out a chorus of delicate notes. There the tale-teller, astride on a floating cob-web, makes fantastic grimaces, and varies with a changeful voice, clear as that of the linnet, his story of enchanted gold and punished misers; and deals around in showers, like apple-blossoms falling in the morning wind, his jests at the thin and misty elfin wealth, and the capricious spriteliness of fairy love.

'Would you tie down the mind of this poor slave to trust in nothing but the reports of his senses and of the conventional voice of society? Would you leave him no treasure or staff but the thorns and thistles with which his rugged hands are too familiar; no more enlivening drink than the bitter draught of wretchedness which he drew from his mother's paps, on which his boyhood has been nourished, and which has well nigh imbruted all the faculties of his manhood? Is that which the earth yields to us, and which we can win from the niggardliness of others, so easy of digestion, so sweet, and nourishing, that we can afford to strike with barrenness, and abstain from cultivating the rich and flowery region laid open to us in our hearts? No, my friend, do not say that you care for nothing but the actual; or the actual itself will lose, ere long, whatever it now has of bloom and charm. Men will soon become weary of that which is near and round them, if they do not look before, behind them, and above. Leave to the Mohammedan his Paradise; blame not the Boeotian, or the Argian, that he thought with joy of Olympus and of Pindus; nor the Roman, that he had faith in the deity of Rome and of Capitoline Jove. The Hindoo feels that he has a wisdom of his own, when he looks from the plain of Bengal to the cloud-like pinnacle of snow, where soars and shines Meru; and the Teutonic herdsman was only

raised above his cattle by his belief in the angel, and the saint, the ghost, the goblin, and the fairy.

'I will even add more than this. When you say that you like a picture which represents what you have been used to see about you every day, you do not mean one which represents the particular objects that you have been accustomed to, but objects of a similar kind, better arranged, for the purpose of being painted, than, perhaps, you ever saw them. Now, whatever superiority of arrangement there may be; to whatever degree the household furniture, the game, and clothes, and common-place countenances are connected and contrasted more pictorially than you commonly see them, to that degree the picture is removed from the region of the actual, and brought into the world of intelligence and art and beauty. For whence comes the law or principle by which those objects are disposed and harmonised, so as to produce even the mean and feeble effect which is designed to be their result, but from a thought, a power existing in the mind of the painter, in some degree perceived by you, and not at all to be found in the things themselves.

'If, then, as is evident, you cannot propose to derive any other pleasure from pictures than a child's delight in the gay colours, (an enjoyment which you may have in a greater degree from a Persian carpet, or a kaleidoscope,) without acknowledging your subservience (a subservience which produces the only true freedom of mind,) to thought and imagination, why should you seek to obey the most meagre and weakest forms of intelligence, instead of exalting yourself by submission to the highest. If you would be made happy by knowledge and love of the fine arts, reverence them in their noblest powers and works. Make yourself a citizen of that state whereof the institutions and rulers are the various forms of truth and beauty. Here is the real dominion and abode of painting; here dwells habitually the painter, and creates around him his own universe of graceful shapes and expressive hues, wherein every mode of human thought has its appropriate and proportionate manifestation by lines and colours; and which melts away, around its whole horizon, into a world more awful and profound than even art can dare to invade.

'The painter lives in calm, and a soft and sunless light; and to his eyes every hidden emotion, and low deep-rooted principle, flowers out into a subject for the exercise of his skill. In quiet and brooding thought consists his magic; and the pencil he uses is of wider sway than the seal of Aschmedai or Solomon. In his ethereal atmosphere a thousand genii inhabit, the mysterious, the oracular, the holy, which you will not meet with in the street or the manufactory, but of which, in the still and self-meditating pauses of our lives, we all acknowledge the being and ministry. Justly has painting been made the art of Christianity, of that which embodies the highest and the largest thought, and which the parables of Jesus and the pictures of Raphael may prove to us to endow with meaning a greater variety of the symbols whereby man is encircled in this animated world, than would the fancies of all poets, or the systems of all philosophers. How little, how very little of the treasures of this art would he be master of who should look for them only in the shells and husks of the material creation, or in all that is most aimless of the habits and fashions of our social life. Weary not yourself with perpetually climbing and reascending the stile which obstructs the entrance to this noble vista; but having once over-leaped it, move boldly forward to the centre, from which all the innumerable and glorious prospects lie before you.

'Painting, too, like the other planetary spirits whereof I spoke to you, has a star and cycle of its own. So, also, has the more complete and self-sustaining art of the sculptor; by which all is forced into a calm and, as it were, circular unity, which has no glimmering shades, no clouds, no firmament, and no horizon. In it we see the self-sufficing power of sedate and cultivated humanity; the highest elevation from which man can look down, though not the highest to which he may look up. But cling, as

you propose, to your bare and paltry personal experience, and this, too, disappears, with all its pure serenity and heroic perfection. Nor will sculpture alone be to you a fretful and worthless riddle; but poetry the regal, the prophetic power, will to your ears be mute, or utter only harsh and inarticulate noises.

'Above all, my friend, if you will never raise your eyes from the dust whereon you tread, what becomes of a kind of truth higher than all philosophies and sciences and arts, what becomes of religion?' . . .

(*The door opens, and enter a servant.*)

'Eh? eh?' said the commission-merchant; 'why, it is quite dark; let us order candles. Bless me! I believe I have been asleep. What, what? Mr. . . . Eh? I hope I have not kept the wine from you.'

'My mistress,' interposed the servant, 'desired me to say that she has kept the tea waiting for you more than an hour.'

'Bless me!' ejaculated the commission-merchant, 'how quick the time passed. My dear sir, you were uncommonly kind in not waking me. But, dear me! what will my wife say to me when we go into the drawing-room?'

CONSTANTINOPLE IN 1828.

Constantinople in 1828. A Residence of Sixteen Months in the Turkish Capital and Provinces; with an Account of the Present State of the Naval and Military Power, and of the Resources of the Ottoman Empire. By Charles Mac Farlane, Esq. 4to. Saunders and Otley. London, 1829.

THAT Mr. Mac Farlane's work is, as respects its subject, exceedingly well timed, the title alone sufficiently proves. This merit, however, is by no means the only recommendation of the quarto volume before us. The 'Constantinople in 1828' happens to be the very sort of book of all others the most required by those who interest themselves in the important events now in progress in the East, and whom neither passion, prejudice, nor self-interest has rendered partisans of any of the three principal actors in the interesting drama. It exhibits to us the Turks and Greeks, but the former more particularly, not through the medium of colours prepared under the determination, or even in the disposition, to support the one or the other cause,—not through a veil, interposed by the views and inferences of the author between his reader and the facts which he professes to disclose, nor by highly-wrought delineations of character, or learned dissertations on customs and manners, such as are too often indulged in on like occasions for the gratification of the vanity of the writer rather than for the information of the reader, and in which the fervour of authorship is much more discernible than accuracy of observation; but by a picture, the simplicity of which bespeaks its fidelity, of the demeanour and actions both of individuals and masses of people, in a variety of circumstances and situations, which placed their dispositions and habits, their actual barbarity, or their comparative civilisation, and their aptitude for improvement, in a striking light. Mr. Mac Farlane relates tales of atrocities committed by the Turks in the course of the protracted struggle between them and the Greeks, and which were perpetrated before his arrival in the country, as he heard them from the mouths of eyewitnesses, and he describes scenes of desolation, the effects of that ferocity which he has himself beheld; but he acquaints us both with the horrors, the accounts of which he has gathered from others, and those he has himself seen, without any attempt at aggravation, and certainly with no apparent desire to extenuate. At the same time the narration of the circumstances occurring to him personally, in his intercourse with the Moslems, leads to the detail of facts, from which his readers may draw the conclusion, although he barely hints at the inference, that humanity is by no means such a stranger to the heart of the Ottoman, and that the probability of the adoption of modern civilisation is not so distant as is generally imagined.

We have addressed ourselves to the duty of drawing the attention of our readers to this book with the

persuasion that, on such a subject, we could not do better than follow the example set by the author, and be content to quote his facts, rather than indulge in speculations of our own on the probable issue of the great question, from its reference to which the new publication draws so considerable a portion of its value; but we cannot proceed to select the passages necessary to afford the means of forming an accurate judgment of the nature of the information furnished them by Mr. Mac Farlane, without avowing that the perusal of his work has afforded us, and we think it cannot fail to afford to all who interest themselves in the general welfare of their fellow-creatures, this great consolation—that, whatever the result of the struggle now going on may be as to the integrity of the Turkish empire, the effect, as far as the interests of humanity are concerned, must prove beneficial—that it must be advantageous even to the Turks themselves. The pages of this volume abound in proofs that the bulwarks which defended the outworks of barbarism have already begun to yield to the force of circumstance; and that, in small things, no less than in greater, in the relation of social life as well as in state policy, civilisation is at least on the advance.

Among the innovations which countenance this satisfactory conclusion, the changes effected by the Sultan Mahmoud in the composition of his army, and his determination to discipline his troops after the European fashion, are certainly not the least interesting, nor the least likely to be attended with important consequences. Already have the courage displayed by the prince in resolving on the dangerous step of remodelling his army, and his firmness in bringing it to a happy issue, met their partial reward, if it be true, as has been asserted, that, at the opening of the second campaign of the war with the Russians, the newly-formed infantry have successfully measured bayonets against the veteran soldiers of the Czar.

Hassan Pasha, the governor of Smyrna, at which place our traveller's Turkish tour may be considered as commencing, had been one of the first of the Sultan's lieutenants charged with the raising and disciplining levies on the modern system; and the Tacticoes, as the Franks call the new troops of Smyrna, were considered only inferior to those of Constantinople, the drilling of whom the Sultan himself had superintended. It is not surprising that an European traveller should be curious to witness the performance of these military novices, and we accordingly find Mr. Mac Farlane, soon after his arrival at Smyrna, making frequent visits to their quarters. Our readers probably will have no objection to follow him in one or two of these excursions.

A small square before a large, half-ruined wooden house, formed the field of exercise, in which three or four Turks, grey-beards, were found putting the recruits through their exercises. We will give the account of the rest of the scene in our author's own words:

'The shattered building, where we heard a tremendous rattling of arms, had been converted into temporary barracks. On advancing to the door, we were kindly invited to enter, by what we should call a serjeant or corporal, and two sentinels at the foot of the stairs presented arms to us; though, I imagine, this honour resulted rather from their spirit of frolic, or a desire of showing their ability to European officers, than from any instructions of their superiors, which would not be consonant to Mahometan ideas. The interior of this building was even more dilapidated than the exterior; the boards creaked, and started, the beams groaned, the staircase shook through every inch, as the noisy inmates ran to and fro; and when we went into a large *salle* on the second story of the building, where some twenty fellows were going through their "shoulder arms" and "ground arms," banging the butts of their muskets on the wooden floor with deafening clamour, I almost apprehended a rapid and vertical descent. All present were extremely good natured and civil to us, and instead of being offended at our close inspection of their arms and accoutrements, and the strange barracks in general, they invited our curiosity, pulled down every article, and took us into every

possible corner. A gratification, however, they did not fail to exact in return: my friend, Lieutenant B——, of the Marines, was begged to shoulder a musket, and go through the exercise as it is really done among the Ingisees. There was no denying them this favour; but, when once he began, there was no ending his military display: he did it so well, that he must have the kindness to do it once more, only once more, and poor B—— went through such a drilling as he had not had for many a day. It was a curious scene. All those who were disengaged ran about us; and these Turks, who would be imagined so starchy and grim and fierce were as playful as so many school-boys. I never after saw this gaiety and natural ebullition among the Moslems but once, and that was among a very different class—the students of the medrese or college, attached to the Mosque of Sultan Amurath, at Magnesia.

After describing the barracks, which, it seems, were merely temporary accommodations, subsequently abandoned for a more commodious edifice built expressly for the purpose of quartering the troops, our traveller thus proceeds:

‘The friends we had made at our first halt, civilly conducted us to another temporary barrack close by, where we saw another party going through the rudiments of drill; and thence to a square in front of the pasha’s palace, where part of the élite of the forces (about three hundred men) were exercising under the eyes of their colonel and officers. Considering that these troops were, at the time, of little more than a year’s standing, they went through their evolutions in good style; they handled their muskets with great activity and tolerable precision, but they had not yet caught the military march-step. The marching, indeed, was the worst part of the exhibition; and its slovenliness is perhaps to be accounted for by the habitual locomotion of the Turks, which is performed by something which I should describe as between a shuffle and a strut, and by their wearing clumsy *papou-shes*, which fit ill to their feet. The most striking deficiency, of course, was that of non-commissioned officers and subalterns; these being imperfect in their service, threw all the work on a few of the superior officers, who were seen running from place to place, performing the duties of drill sergeants: even the colonel did this, and was seen racing and storming, and using the flat of his sword, until he appeared ready to drop from heat and fatigue. Strange work this for a colonel! but so few were the subjects possessing any previous knowledge of the military art, that they were obliged to submit to it. Another strange sight to see, was, that many of the officers carried thick heavy horse-whips, made of plaited thongs, not merely for ornament, as was demonstrated by their frequent application to the shoulders of the awkward or careless soldiers. This endurance of blows which the *tacticoes* bear with the equanimity of an Austrian recruit, is considered, by those acquainted with the proud and fiery character of the Turkish people, as not one of the least strange workings of the “new order of things.” The colour of the uniform of the Smyrna corps of regulars is blue; their jackets, like those frequently worn by Italian sailors, are long, and rather more loose than becomes military *tenue*; their trousers are very wide down to the knee, where they are tied in, thence they fit close to the leg, and descend to the instep; neither stock nor stockings have been introduced; and the want of them, and bare necks and feet, give a dirty, forlorn look to the whole man in the eye of a European. The European military hat or *shako*, has not been introduced; but the eastern turban has been entirely put aside. They wear red cloth caps, (not small, and gracefully clasped on the crown of the head, as with the Albanians, but large,) padded, and descending over the whole of the upper part of the head, and reaching the ears: a blue tassel in silk or wool, is pendant from the crown, as an ornament. This description will certainly not convey a splendid idea of the uniform of the *tacticoes*; but even this, as worn by some of the officers, properly made to fit, and in good materials, with a *croissant* worked in silver, or in small brilliants (according to their rank) on the breast, with a good cap, and flowing bushy tassel, and a neat pair of morocco leather boots, or at least a pair of stockings in their alippers, does not look amiss. The best part of an officer’s equipment is, however, a cloak or mantle, worn

occasionally: this is fastened round the neck by a silver clasp, and descends below the knee in loose folds; the colour is a rich Turkish red. It has a graceful and military appearance; and so sensible are the wearers of this, that they can scarcely be induced to resign it by the heat of the dog-days. No people, perhaps, are more attached to dress than the Turks; and had the grand signior’s finances permitted, it would have been wise in him to create an affection to his essay (the regular service) by giving them a dashing uniform.

‘The muskets and bayonets of the troops, which were furnished by a house at Marseilles, are of inferior French manufacture, and were not kept remarkably clean. The belts and cartouche boxes were extremely slovenly, and hung too low; a trifling defect to the eye, which they share with the French. The instructors and officers were all Turks. At the commencement, the pasha had a Piedmontese; but he was dissatisfied by his entire ignorance of the Turkish language, without which it was impossible for him to do much; and the soldier of fortune, on his side, thought his services inadequately recompensed, and retired. The colonel and one or two elderly officers had acquired their knowledge, during the fatal attempt made by Sultan Selim, to introduce discipline and European tactics. Indeed, it was a few of these men who escaped massacre at the time from the hands of the Janissaries, and who were found alive at the suppression of that body, that formed the nucleus of the infant Turkish army of Mahmoud. It was on these men the Sultan called, and on them he relied. A very false idea prevails in Europe, as to the number of Christians employed in the formation of the new troops, and also as to those actually in Mahmoud’s service. The fact is, he never has had more than a few individuals employed merely as instructors, without rank or command in his army, and they had dwindled down to almost nothing before the opening of the Russian campaign of 1828. As the Turks of the *Nizam djedid*, under Sultan Selim, were instructed by French officers; and as the Europeans employed by the present Sultan were either French or Italians who had served in Buonaparte’s army, the French system of drill and evolution has been naturally adopted for the new troops.

‘During my stay in Smyrna, I was a frequent visitor to the Turkish side of the town, to see the exercising and progress of these *tacticoes*. On particular days, all those who had passed through the “awkward squad,” exercised and manœuvred before the pasha and his court. By the end of September, 1827, there were between six and seven hundred men, so far advanced; the mere *tyros* were between three and four hundred.’

These military disciplinings were objects of lively curiosity to the inhabitants of Smyrna; the occasions were considered as holidays by the Moslem population, and the reviews and parades were attended even by Turkish women, ‘who,’ says our author, ‘contrary to an opinion prevalent in Christendom, are constantly gadding about, and who seemed to find much amusement in these military scenes, particularly in the firing.’ The effect on the minds of the men is thus described:

‘The countenance and admiration of the fair sex, to the new military, and to “the pomp and circumstance of glorious war,” even though such were but imitations of the faithless Christian, seemed to be pretty generally shared by the young Turks, particularly by those of the city. There were, however, not wanting sneerers and scoffers, and deprecators of the departure from the old and true Osmanli arms and tactics, and the modern and impious adoption of the *summanly* weapons, and riddling, incomprehensible manœuvres of the Ghisours. Such men, indeed, were numerous both at Smyrna and Constantinople, though in the latter city the expression of their contempt and complaints was, for good reasons, much more guarded. Besides the exclusive attachment to what was Mussulman and antiquated—besides their religious fanaticism—a considerable portion of the spirit of Janissaryism entered into all this.

‘A grim old Osmanli, from the inland district of Magnesia, a true Turk, who looked upon every change as a crime, happened one morning at the review to enter into conversation with a Lezantine gentleman, with whom he was acquainted. “So these are the new troops,” said

he, “that I have heard so much of; these are the troops that are to defend the Ottoman empire from its enemies! And what, in Allah’s name, can the sultan expect to do with these beardless, puny boys, with their little shining muskets? Why, they have not a yataghan among them! What does this mean? It was with the yataghan the Osmanlis conquered these territories and the countries of the Christians; and it is with the yataghan they ought to defend them. The yataghan is the arm of Mahomet and of his people, and not that chibouque-wire I see stuck at the end of their guns. Mashallah! And what sort of a monkey’s dress is this? What sort of ugly-faced, shrivelled, puling dogs are these? Why, they don’t look like Osmanlis! And the land of Mahomet to be defended by such as these!—Baccaloon!” He continued somewhat in this style, blaming all he saw, and breathing his choler from time to time with a—“If it please Allah!” “Allah be praised!” “We shall see!” “What is written is written!” and other good Turkish orthodox exclamations. Of their deploying, their lines, their squares, and other mathematical figures, the *tacticoes* formed in the course of their evolutions, he could make out nothing, except that it all appeared very silly. But when they came to firing; when he saw a regular rolling fire maintained along the line; the firing in platoons; the means of defence of a solid square;—all which was very tolerably executed;—and other things which his philosophy had not dreamt of, he was obliged to confess that it would not be so easy as he had imagined to charge and cut such troops to mince-meat, with the yataghan in hand. Indeed, at length his progress to conversion seemed merely impeded by the conviction, that though clever and effective, this mode of warfare was wicked and unbecoming of the children of Mahomet, being derived from profane, infidel sources.’

Horror of innovation, it seems, is not an exclusive characteristic of a civilised age and people. Are we to conclude from the last sentence or two of the passage just extracted, that openness to conviction distinguishes the barbarian hater of change from his more civilized brother?

The picture of the *Tacticoes* would remain imperfect without the addition of the following passages:

‘One remark of the prejudiced old man does, however, merit attention, at least in my opinion, as I have frequently made the same myself. The *tacticoes*, in fact, do not look like Turks, (generally a fine set of men, physically considered;) they are short in stature, clumsily made, by no means robust, and abominably ill visaged. Only a trifling part of this difference can be accounted for by the change in their dress, the rest must be sought for in other causes, to which the following circumstances may afford some induction.

‘On carrying into execution his long-favoured plan for raising a disciplined army, the grand signor directed the levies to be made among young lads, and principally in districts remote from the great cities of the empire; thus wisely insuring to himself a superior degree of docility, and running little risk of his conscripts having the dangerous talent of Janissaryism among them. The regular service, as may be well imagined, was not much affected; and the better class of Turkish peasants bought off their sons from the officers and local authorities, who, in Turkey, are universally corruptible by bribes, to an extent perhaps unknown in any other country. The weight fell on the most degraded of the peasant caste, and for the most part in poor, mountainous, rude countries. The Turkish people, when they first came in contact with the nations of Europe, were remarkably ugly, and their great improvement has been attributed to the intermarriages, once very frequent, with women of different countries, where the standard of beauty is high. But immense portions of the original race, that remained stationary in remote districts, (particularly in the interior of Asia Minor, which has furnished so great a part of the levies,) can have had no such opportunities of improvement, and may have retained their original Tartar ugliness.’—Pp. 30, 31.

Our author had afterwards occasion to observe the progress which the European system of drill had made under the eye of the sultan himself, but did not find much to add to his account of the *tacticoes* of Smyrna. Speaking of the sultan’s guard and of

the troops of the oldest standing, of whom there were two or three thousand in the capital, he describes them as extremely active, quick in all their movements, and able to perform their manœuvres with the rapidity of some of the finest European regiments. The evolutions, however, it is added, were not done neatly or symmetrically, but the result was obtained, lines were changed, squares solid or hollow formed, the troops again deployed with celerity, and if their style of step and march would not satisfy the critical eye of an English or German serjeant-major, there was nothing to be said against the promptness and regularity of their fire.

We shall take a future opportunity of returning to this interesting volume, and of selecting from it other proofs of change in the social habits of the Turks, which, although not in all cases perhaps for the better, (in getting drunk for instance,) are valuable as indications of a disposition to relaxation from prejudice.

(To be continued.)

THE SCHOOL OF FASHION.

The School of Fashion: a Novel. 3 vols. 8vo. London, 1829. Colburn.

To this very lively and amusing book we cannot (at least in our present number) render the honours it deserves. It takes that light and airy view of character, manners, and opinions which requires as thorough an understanding of them as the deepest discussion, and to which a flexibility and gracefulness of spirit are necessary, such as we do not always find in systematic investigators. At the same time it is pleasant to see that the light of the author's pleasantry is an illuminating not a consuming fire. There is in it, we think, scarcely any thing of that bitter and mocking propensity which, under the disguise of wit and laughter, throws us into a mood of more fretful sadness than is produced by any other kind of human thought. It is really very pleasant, amid the wilderness of monstrous and idiotic phantoms who obey the spells of Mr. Colburn and other patent enchanters, to meet now and then with a reasonable, good-humoured, and unaffected being, such as evidently is the author of the *School of Fashion*. We shall not attempt to give an account of the plot, which is not very important; nor of the characters, which can be satisfactorily understood only by a perusal of the many agreeable dialogues with which the book is filled. We prefer to give a sample of the author's qualities. It would have been easy to find a more striking passage than the one we have selected; but it is exactly suited to our limits, and we trust will amuse our readers:—

"In the course of time Lady Blaney Mount Shannon, being first in rank, watched for the eye of Mrs. Buckle, to make that little signal for a move, which probably creates in no two people precisely similar feelings. To the lady with a weak stomach, whose feet begin to swell, and her nose to redden, from the heat of the dining-room, it is the greatest blessing. To the coquette, who hates an interruption to her flirtation, and anticipates no pleasure from the society of her own sex, it is a grievance. To the neighbour of a bore it is a relief; and in that light (to judge by the conversation which generally takes place after the departure of the ladies) it is viewed by the male part of the society.

"We have often heard conjectures made by men, as to the probable subjects of discussion in the female conclave after dinner. Though as boys, under the age of thirteen and fourteen, are generally admitted into these petticoat mysteries, under the false idea that they are too young to understand what they hear, we are surprised that they should not remember, that there is no time when ladies' small-talk is so very small as then. All the ladies of course go first to the looking-glass, to see if their curls have been at all discomposed by heat, awkward servants, or any other such calamity. They next remark upon the colour of each others' gowns, or ribbons, or hats, or scarfs; and then those never-failing topics of births, deaths, marriages, servants, nurseries, and governesses, naturally begin to occupy their attention.

"Lady Blaney," said Mrs. Buckle, "can you re-

commend me a nursery-maid? I find we cannot manage without one, now baby begins to walk."

"I do not at present know of one that I could recommend, for I think one should always be so very careful about recommending people when children are in question. You have a nurse I think?"

"Mrs. Buckle replied in the affirmative.

"Well now you must excuse me for giving you advice; but to people who are obliged to mind expense, I think it might easily be managed to make your own maid the superintending person, and so have a maid under her; by this means you keep one servant less."

"Lady Blaney was very proud of her arrangement of the home department; and as she was "My Lady," she thought it a merit to be so, and therefore proclaimed it. Mrs. Buckle, on the other hand, never could bear to be supposed "poor;" and, consequently, as her greatest object was to impress others with her own indifference to expense, Lady Blaney's advice was entirely thrown away; indeed, were the truth known, she had very little thoughts of increasing her establishment, and only wished to show to her friend that she had the power of so doing. Not liking, therefore, the manner in which her "show off" had been taken, she quickly turned the subject by saying—

"Do tell me, Lady Blaney, how do you settle the matter now between your nurse and the governess? Do the younger children dine with Miss Wilkinson yet?"

"Mrs. Buckle was immediately informed of every particular respecting the children's eating, drinking, and sleeping; how their cribs were placed; when they exercised their bodies; and how their minds were cultivated.

"I suppose," said her Ladyship, in allusion to Mrs. Buckle's situation, "you expect, soon."

"Hush," she replied, drawing her chair nearer to Lady Blaney, "speak lower, if you please, when Rosa is in the room, she is so innocent, dear girl! She actually now believes that all her little brothers and sisters are found under the cherry-tree! It is so very delightful to have their minds such perfect white paper!"

"Here the ladies whispered, and the words "last year," "before the time," "nothing ready," "such distress," "baby linen," &c. &c. were indistinctly heard by the two young ladies, who were diligently occupied at a table in another part of the room—Miss Rosa in spoiling muslin after a pattern given her by Lady Emma Danvers, and Miss Laura in copying music that she had heard in London, into the smallest possible book.

"Though these two opening buds had no great affection for each other, yet, as the two married ladies had got into such close conference that they felt themselves unheeded, they took the opportunity of having a little friendly chat.

"So, Rosa, I see Mrs. Buckle is in the family way again! what a number of you there will be to be sure!"

"Hush! Laura, pray speak lower, for Mamma thinks I don't know any thing about it. Our old nurse and Sally always tell me every thing, but Mamma would be so angry if she knew it. Do you know I heard her one day advise Lady Blaney never to let her girls have the run of the library; so the first day Papa went out, I got into the study to see what the reason of this could be, and I'm sure I never read so much in my life as I did that afternoon; but, la! there was nothing that I could find but what every body knows."

"What books did you read?"

"Oh! I looked into such a quantity; and as Mamma is always so afraid even of my brothers seeing "Reece's Medical Guide," I took down a book all about physic, just to know why we may not see it."

"And did you make out?" inquired Laura.

"No! for just as I was opening Metaphysics, I heard a footstep; but it seemed to be about some horrid disorder, I saw the word 'matter' so often: I don't know where the complaint is."

"No more do I," said Laura, who had, however, some indistinct notion that she had heard Metaphysics mentioned with Craniology in London, "but from what I heard in town, I believe it is only a disorder in the head."

"What a difference it makes in the friendships of youth when there is nothing to excite feelings of jealousy or

rivalry! Laura did not like Rosa at dinner, because they were in company, and she feared people would admire Rosa's red cheeks more than her fashionable air. Now that no one else was present, they were very fond of each other; and Miss Dyer being two years older than Miss Buckle, the latter listened with great attention to what she had to say; and the former had no objection to opening her heart to an attentive and envying listener. Thus, after one had copied a few wrong notes, and the other stitched the small stalk of a flower, Laura sighed loud, that Rosa might ask why.

"It is ten days yet to the ball! said Miss Dyer. "How noble in those dear Officers to give us a ball, though they are all so poor that they say themselves they never can pay for it."

"It is, indeed," exclaimed Rosa with enthusiasm.

"So considerate of them, to be thinking of the amusements of others in the midst of all their own hardships! Night after night they take it by turns to mount guard! I often think how shocking it is, that whilst we are sleeping comfortably in our beds, without waking all night, they never close their eyes, and are watching, even in time of peace, over the safety of their country, like guardian angels!"

"This sentiment almost made Rosa's tears fall, she thought it so beautiful; and it had not struck her before, though she had also bestowed a few thoughts upon the Regiment.

"You don't know what it is to be unhappy yet," she continued.

"Yes, indeed! but I do," said Rosa, as she gave a little sigh; "only Mamma don't know it."

"You will see him at the ball."

"Whom Laura?" inquired Miss Buckle, anxious to know which "him" she meant, and equally curious about her friend's "him," as interested in her own.

"Why, my Eustace to be sure."

"Do you know him to speak to, Laura?"

"Know him! I have danced twice with him."

"Poor Rosa felt quite crest-fallen, for she did not know her Frederick, though she was quite as much devoted to him as was Miss Dyer to her Eustace.

"He actually brought the invitation himself to us," continued Laura, "for the Regimental ball, and he looked so handsome in his dear foraging cap, and the sash tied round his waist! I am trying to learn the sitch, that I may make one for him, if he continues to shew me as much attention as he has done lately."

"Does he really talk to you, and make verses, and give you his hair, and look at the moon at the same hour that you do?" eagerly demanded Rosa, anxious to discover how much more blessed was her friend than herself.

"No! not yet; but I am to dance the supper dances with him at the ball, and Heaven knows what the fascinating creature may persuade me to accept there."

"Here Laura looked down and simpered at the thoughts of the proposal which she conceived it probable that she might receive from Cornet Somers.

"Ah! Laura! how I envy you," said Rosa; "I don't believe Frederick knows me, even by sight; but I heard his voice when he was talking to one of my cousins the other day. I have bought a book on purpose to keep a journal of all he says, if I could only get introduced to him; but Mamma thinks I bought it to write out the history of England, and that sort of stuff. I cannot sleep for thinking of the ball, and there I shall see him in full regimentals."

"How I pity you, poor child!" said Miss Dyer, feeling quite satisfied of her own superior powers of attraction. "I wonder you can live without something to comfort you all this time."

"But I have one treasure which I look at every day," said Miss Buckle, "and I always wear it at my heart, and then I try to copy it, and I sleep with it under my pillow, because then I dream of Frederick."

"What is it?" exclaimed Miss Laura, the horrible idea having crossed her mind that Rosa possessed a picture of her lover, while she was without any such delightful consolation in the absence of her cornet.

"Stop a moment," whispered Miss Buckle, as she warily looked round to see that her mother and Lady Blaney were month-nursing, or suckling, or weaning with sufficient earnestness to prevent their observing her

"I will shew you;" and as the rich bloom spread all over her face, head, neck, shoulders, and arms, till she looked like a fresh blown piony, she drew from her bosom a visiting card! "Here it is, take care, it is his own hand-writing! I stole it out of my uncle's hall the other day, and have never let it be away from me for a moment since; it is as good as printing, I declare; Lieutenant Frederick Radcliffe! what a beautiful name! Don't you pity me, Laura?"

Before, however, Miss Dyer could assure her of her sympathy, a move on the part of Mrs. Buckle and Lady Blaney caused the card to be popped back to its hiding-place, and all further *épanchement* to cease. The two elder ladies had finished their maternal communications, and having nothing else to talk upon, the large work-basket of Lady Blaney, and the tiny box of Mrs. Buckle were opened, and in a few seconds the former was diligently sewing a boy's shirt, and the latter counting her beads over a necklace, by which means they each displayed their particular tastes—Miladi for economy, and Mrs. Buckle for finery.

No one, we imagine, can deny that the foregoing sentences are very laughable and exhilarating. Yet it is rather below than above the general rate of cleverness and humour in the book; and more especially will give a very inadequate notion of the sound sense and genuine good feeling which naturally display themselves throughout its sprightly pages.

NATURAL PHILOSOPHY.

Principles of Natural Philosophy; or, a New Theory of Physics, founded on Gravitation, and applied in Explaining the General Properties of Matter, the Phenomena of Chemistry, Electricity, Galvanism, Magnetism, and Electro Magnetism. By THOMAS EXLEY, A.M. Associate of the Bristol Philosophical and Literary Society. pp. 478. 8vo. Longman and Co. London, 1829.

WE feel much disposed to characterise this book by a paradox, by saying it is the *most* and the *least* theoretical of any work on natural philosophy which we have ever seen. Our meaning will be better understood when we inform our readers, that the author has not framed new principles and new hypotheses upon which to build his New Theory of Physics, but has only extended the Newtonian principle of gravitation, to explain the phenomena, not only of chemical attraction, but of electricity, galvanism, magnetism, and light. We are not prepared to give our assent to all the views which he has here given respecting these subjects; but they seem, from his statements, to be extremely plausible, and it is impossible to deny them to be simple, perspicuous, and very ingenious.

The extension of the common principle of physical attraction to chemistry, has long been hovering about in our own fancy, but very vaguely, we confess; for we could never muster sufficient resolution to investigate the matter by experiment, or to take advantage, for illustration, of the experiments of others. Mr. Exley has done all this in a manner highly creditable to the soundness and accuracy of his judgment, as well as to his shrewdness and ingenuity.

Sir Isaac Newton and his followers conclude that the attraction by which the particles or atoms of bodies adhere together, observes a different law from that which regulates the distant bodies of the universe, and decreases at a greater rate than directly as the quantity of matter, and reciprocally as the square of the distance. (*Principia* I. 85, &c.) Mr. Exley thinks he has discovered an error in this beautiful theorem, which requires the attractive forces to be directed to *every point* of the sphere; for, in every point of a body, even on Newton's own showing, there are not atoms situated, since he admits that the most dense bodies contain more vacuity than solid parts; hence the proposition will not apply in nature when rigidly considered, and it is not a little wonderful that Newton's penetrating genius did not perceive the discrepancy. Our space will not admit of our giving more than a part of the argument the author on this point:

"It has been said that the attraction of cohesion, at a small increase of distance, is changed into repulsion; thus when a piece of glass is broken, and we attempt to replace the fragments, there is a repulsion, and the parts cannot be again forced so near together as they were before the fracture, the parts being now removed into the sphere of each other's repulsion. But here again, we ought to observe, that the surface and pores of glass and other bodies are replete with a fine elastic fluid, which by attraction adheres to those parts of the corpuscles to which it can gain access; and as soon as the glass or other body is broken, the particles of this elastic fluid diffuse themselves by their mutual repulsion over the surfaces exposed by the fracture, as will be more fully explained in its place; and these atoms of ethereal matter so diffused by their repulsive forces will prevent the reunion. Various kinds of attraction have been supposed to exist, but every kind, not excepting electrical and magnetical attractions, may be explained without having recourse to any attraction but that of universal gravitation, affecting every atom of matter of every sort after the same manner, and according to the law above-mentioned.

Many opinions have also been entertained respecting these powers, especially repulsion; some philosophers are persuaded that the atoms of matter have several spheres of repulsion and attraction, succeeding each other alternately; others have supposed that repulsion acts between the atoms of matter at sensible distances; and others again conclude that caloric is the sole cause of repulsion. Caloric has been considered as the only agent in repulsion at minute distances; it has been called "the repulsive power, which constantly acts in opposition to the power of attraction, or chemical affinity."—*Parke's Chem. Catechism*, p. 88.

Some have considered the law of repulsion as unknown; others state that it varies inversely as the square of the distance; and others, that at the least, in some cases, it varies inversely as the distance. It is now generally admitted that repulsion is as universal as attraction.

Without this power, elastic bodies could not recover the figure and state which they had before compression. Its action must be perpetuated between every two atoms of matter, otherwise they would adhere inseparably in complete contact; for so minute are the smallest parts of matter known to be, that the attraction between them, if in contact, would be indefinitely great. It cannot, however be shown that repulsion varies by any other law than that of the square of the distance inversely. It is, indeed, ascertained by careful experiment, that when dry air and other gases are gradually compressed, their densities vary as the compressing force; and from this it has been inferred, that the repulsive power of the atoms of gases varies inversely in the simple ratio of the distance of the atoms. This inference rests on the supposition that all the repelling atoms continue in the compressed gas, and without this it cannot be true.—(Page xiv.)

Now we cannot deny that this is exceedingly ingenious and plausible, though it would require a longer investigation than we have at present leisure to go into, before we could bring ourselves to adopt or reject the author's principles. Upon what is usually considered one of the fundamental facts of philosophy the author is no less original, though he is also more than usually hypothetical: we refer to the doctrine of atoms,—a doctrine respecting which we ourselves have long been sceptical. That the solid materials of the universe may be composed of very small bodies impenetrably hard and of a certain shape, round, angular, or amorphous, is neither impossible nor improbable; but that such corpuscles or atoms really exist has never been proved and perhaps never will. Certain experiments upon crystallization seem to indicate that the smaller portions of a crystal are always globular; though this is announced more by inference than by actual observation, and cannot therefore be admitted as proved. Amidst this uncertainty about the fact, we think the following remarks, by our author, not a little ingenious and worthy of attention:—

"It may be asked, Are we absolutely to exclude solid atoms? I confess I can find no use for them. It is true

Sir Isaac Newton thought that the atoms of matter consisted of minute solida, as appears from the following beautiful paragraph taken from the closing part of his incomparable *Treatise on Optics*:—

"All these things being considered, it seems probable to me, that God in the beginning formed matter in solid, massy, hard, impenetrable, moveable particles, of such sizes and figures, and with such other properties, and in such proportion to space as most conduced to the end for which he formed them, and that these primitive particles, being solids, are incomparably harder than any porous bodies compounded of them, even so very hard as never to wear or break in pieces: no ordinary power being able to divide what God himself made one in the first creation. While the particles continue entire, they may compose bodies of one and the same nature and texture in all ages: but should they wear away or break in pieces, the nature of things depending on them would be changed. Water and earth composed of old worn particles and fragments of particles, would not be of the same nature and texture now with water and earth composed of entire particles in the beginning. And therefore, that nature may be lasting, the changes of corporeal things are to be placed only in the various separations and new associations and motions of these permanent particles; compounded bodies being apt to break not in the midst of solid particles, but where those particles are laid together, and only touch in a few points."

The atoms of matter constituted as in the theory now proposed, possess all the individuality, indivisibility, and indestructibility which the learned and illustrious Newton ascribes to his small solids, and may answer all the ends he has mentioned; the central points indeed will be utterly impenetrable by each other, since the repulsion there is infinite; and if at those centres we suppose small solids to be placed, they can answer no further end than is accomplished by this immensely great repulsive force, for from what we know of matter, we must suppose them to be indefinitely small, if we introduce such solids; and hence they will occupy the place where the repulsion is indefinitely great; such solids would be found only an obstacle and an encumbrance to the free action of matter; since, however small we imagine them to be, their magnitude will be infinite if compared with a mathematical point the centre of an atom, which is devoid altogether of magnitude. It may be added, that if any reader wish to retain these solids at the centres of the atoms, it will not materially affect the conclusions, provided he allow us to trace them as small as we please; and so much if he intend to philosophise, he must grant whatever course he may determine to pursue.—Page xxi.

Such is the sort of reasoning which Mr. Exley employs upon this abstruse subject, and it must be confessed to be no less ingenious than plausible. The views which he has taken became first apparent, he says, when he was attempting to explain electrical phenomena. What is more extraordinary still, they seemed to be confirmed on finding that the reflection, refraction, and inflection of light could also be rendered intelligible by the same simple means. He had it in contemplation, accordingly, to introduce the subject of optics, had this not involved too abstruse mathematical principles to be intelligible to common readers.

We have been exceedingly pleased with the execution of the work as well as with its plan, which first describes the phenomena, then exemplifies them by experiment, adding, when necessary, observations, corollaries, &c. For example:—

Phenomena 2. If a vessel of glass, porcelain, metal, &c. have a thin stratum of water on its flat bottom, and if a drop of alcohol be placed, by means of a glass rod, nearly on the centre, a dispersion of the water is produced, leaving the bottom of the vessel dry; the edge round the alcohol presents an undulating or tremulous motion, showing the continual emission of the particles of alcohol to the water till they are united. This is most evidently seen by varying the experiment, first using water tinged by turnsole, and then using alcohol similarly tinged.—*Nicholson's Journal*, vol. viii. p. 20.

In this experiment we perceive a repulsion and a subsequent union.

Exp. When liquids of different composition are put

together, an easy deduction from the theory will show that in many cases a part of the atmospherules of the one fluid will pass over to those of the other, and in the present case a portion of the atmospherules of the alcohol being transferred from those of the water, will cause the dispersion of a thin stratum of that liquid, and after the equilibrium of the atmospherules is attained, the mixture will be effected, and the parts will either cohere or enter into chemical union."—Page 89.

We wish we could spare room to quote some of the very ingenious and simple explanations which our author has given of the phenomena of electricity, galvanism, magnetism, and electro-magnetism; but for these we must refer the reader to the work itself, which is well worth the perusal of all who have a taste for natural philosophy.

GERALDINE OF DESMOND.

Geraldine of Desmond; or, Ireland in the Reign of Elizabeth. An Historical Romance. 3 vols. 12mo. Colburn. London, 1829.

If our ancestors ever held the opinion which we are in the habit of attributing to them, that the duties of women were confined to clear-starching and embroidering, they did not intend thereby to derogate from the dignity of the sex; they did not insinuate for a moment that ladies had not souls above muslin. All they wished to signify was this, that if the consciousness of ladies will not allow them to be content with performing only the easy duty of making all the world happy, the additional offices which they impose upon themselves should be rather those which require industry and dexterity than wit and originality, the reason being, that they must needs consume so much of the latter in their first grand occupation that they can have little left for these subordinate ones.

A portion of the female sex which has in some points deviated very far from the practice of the old times, appear to have recognised the propriety of this canon; for, in extending the sphere of their operations very far beyond the limits prescribed by their foremothers, they have been careful not to change the quality of the operations themselves. They have regarded with too much reverence the talents, whereby their worthy progenitresses performed their extraordinary feats, to substitute any others in their place, even when the material upon which they had to work was different. Accordingly, they have spun histories, worked novels, and embroidered poems, by the same mechanism which formerly spun worsted, worked caps, and embroidered arm-chairs. Those estimable persons, the late Miss Benger and the present Miss Aikin, acting upon this principle, have constructed works which display a diligence that, otherwise directed, might have lined Westminster Hall with tapestry. But they have reserved their higher gifts for the purposes to which nature principally destined them, the improvement of themselves, and the edification of the social circle.

The example of those ladies has had its influence more upon those who, like the authoress of 'Geraldine,' instead of feeling alarm lest their genius should not suffice its primary uses, labour under the more reasonable apprehension lest it should overflow its banks and deluge conversation, if not allowed to find an outlet in a book. Though with no ground to fear that their own resources will not be sufficient to make a work popular, the modesty of these fair writers induces them to spend much more time than is needful in adding to it the wisdom of books. Accordingly, not to mention the mottoes, of which there are seldom less than five to each chapter, the notes to this work display a quantity of reading which could only have been collected by the labour of many years in ancient libraries. So far as this learning has affected the text, we are grateful for it, as we have not the least objection to help out our vague surmises respecting the character of our ancestors by authentic and elaborate particulars respecting their dresses. In this knowledge, the authoress of 'Geraldine' is perfectly unrivalled. We have gained more light respecting the minutiae of young ladies' attire from these volumes, in the course of a

few hours, than we had any hope of being permitted to obtain in the course of a whole life. Indeed, nothing but the pleasure and advantage which we derive from this information could atone for the serious alarm we have felt at the profound acquaintance with the mysteries of our sex's wardrobe, which the acute observation, vigorous fancy, and extensive reading of the lady before us, have enabled her to acquire. Nevertheless, with all our admiration for the diligence which must have been employed in collecting these facts, and our gratitude for its results, we could have been well contented to exchange it all for a few such vigorous descriptions as the one we are about to quote; though we ought not for a moment to leave our readers under the impression that there are not other scenes in the book quite as powerful, and which promise as well for the success of the author's future career as a novelist:

'The dispositions for the expected battle were made by the direction of Spanish officers of acknowledged skill, gallantry, and experience. Hence there was greater regularity and more address displayed in the military preparations, than was usually evinced in the desultory system of Irish warfare.

'But to reduce such miscellaneous materials into any thing like the appearance of order, required much tactical skill. The most able general would have found insurmountable difficulties in attempting to subject bodies of rude mutineers into a state of military organization; therefore, all that could be done was to endeavour to stem their force within those boundaries, from whence it could be brought to bear, with the most practical effect, upon the objects of their vengeance. For this purpose, numbers of the militant rustics were secretly posted in a thick forest, that skirted one side of the plain on which the crowded encampment of Sir John Desmond lay. In this ambush they were ordered to remain in perfect silence, until the favourable moment arrived, when they might deal destruction on the foe, by rushing forwards in a sudden onset. Within the walls of an old abbey which stood upon the field of battle, and hidden in the hollows of the adjacent hills, bodies of marksmen, armed with javelins, bows, and arrows, were stationed. These, from their superior skill, were expected to do much execution. The same shelters which concealed them from the view, gave the double advantage of secreting the archers from personal danger, and of enabling them to assail the enemy, by shooting arrows, alighting javelins, or throwing huge stones unexpectedly upon their ranks.

'We have said that the whole amount of the Irish forces did not exceed two thousand men. This little army was marshalled at the foot of a thickly-wooded mountain, which bounded the plain of battle on one side. The Spanish and Italian troops, with front ranks of Irish soldiers, who were armed with pikes seven feet in length, formed the main-body, in the centre of which, the great national banner, called the *Sun-burst of Erin*, emblazoned with the heraldic cognizance of the harp, waved its draperies of green and gold, upheld by the ensign-bearer, and surrounded by the hereditary guardians. Crowded about the person of the *Sun-burst*, and the pappal standard, which was unfurled near it, fifty minstrels appeared, clad in wide robes, and *birrid* caps. These men, striking their harps to the war-strain of Ireland, looked as if endowed with a prophetic spirit, while they hymned forth songs of triumph, with a resistless energy, which found its unison in patriotic breasts, that panted to achieve the victories predicted in the eloquence of bardic inspiration.

'Upon the right wing of the army, the hobblers, or Irish cavalry, were placed, attended by their *Dattius*, and flanked by platoons of spearmen. The left wing was composed of the kerne, or light-armed infantry, and files of gallow-glasses in their short brazen harness, who bore the formidable battle-axes which have been already noticed.

'The mass of people who followed the army formed dense and irregular bodies in the rear of these positions, and their courage, animosity, and strength, almost seemed to atone for their defect in discipline. We have already said that the command of the Irish was vested in Sir John of Desmond. Sensible of the advantages derived from the cover of the mountains, which secured his troops from being charged or surrounded in rear; the Irish Ge-

neral resolved not to relinquish his position, and therefore determined to await the onset of the Royalists, upon the ground which he had taken.

'Sir John of Desmond led the centre of the Irish army. The conduct of the right wing devolved on the O'Nial. That of the left was intrusted to Mac-Carthy More. The Knights of the Red Branch, the Knight of the Valley, the Knight of Kerry, and the White Knight, availing themselves of their privilege of wearing five colours, appeared on this occasion splendidly accoutred, with breast-plates of pure gold, and chains of the same metal round their necks; and as they headed their clans, they seemed to justify the designation which the voice of Europe had bestowed on the Cavaliers of Ireland, in styling them "the Heroes of the Western Isle." The Lord of Ophaly, and the Chiefs of all the other clans, held different important stations in the field, and watched with wild enthusiasm and restless impatience, for the approach of the English army.

'At this solemn moment, when impending danger increased the courage and added to the revenge which was rankling in the hearts of all, Allen rushed through the Irish ranks, and holding high above his head a naked sword, exclaimed: "Comrades, I have changed my palmer's staff for this! and, by the help of God, its blade shall draw the heart's blood of our foes!—Comrades, Ireland beholds you! Victory to her and Rome!"

'The wild war-cry of the country answered this appeal.—A response thundered from the British troops. Their drums and trumpets struck upon the ear, and with desperate rapidity three columns of the English rushed to the attack.

"Charge, for Saint George and the Queen!" resounded from the royal lines.

"Onward, for God and Ireland!" rose in a shout of triumph, that was echoed and re-echoed by the whole of the allied troops, as with unshaken firmness they received the shock of the British onset. The dispositions of the English were obliged to be regulated by those of their opponents. Mutual enmity seemed to animate both armies. Hand to hand, and horse to horse, they struggled with the inflexible courage and the proud feeling of men who were resolved to conquer or to die. A desperate attempt was made upon the main-body of the Irish, by a phalanx of the British infantry. Dreadful slaughter ensued, for each side fought with invincible valour. But at length the superior discipline of the English troops prevailed, as, breaking through the front ranks of the enemy's pikemen, they threw the centre of the Irish into great confusion. Then rushing in between the main body and the right wing, the English succeeded in separating the latter from the middle division, and routed the hobblers, some of whose squadrons they broke. But the severed wing soon formed again: displaying the utmost bravery, they returned to the charge, and being forced to a close fight, both sides engaged man to man with incredible valour. In the mean time Lord Thurles, at the head of his cavalry, had attacked the right wing of the Irish. The green and blue colours, the arms and achievement of a lion chained, and the motto, "Lamb Dearg Eirin,"—i. e. the red hand of Ireland,—which were emblazoned on the banner of the O'Nial, distinguished him from every other chief. To see was to attack. The Vircount rushed upon his rival. "Geraldine of Desmond!—You know the rest.—Rebel! look to your life!" cried Thurles, as he prepared to charge.

"Strike for Geraldine of Desmond! Strike!" shouted the O'Nial, madly careering against his adversary. The swords of the opponents clashed and crossed each other, and the horse of the O'Nial staggered beneath a gash which pierced to the quick. Both combatants leaped to the earth, and renewed the deadly contest. Each fought with devoted valour. They foamed and struggled together, foot to foot, and hand to hand. The conflict grew more furious than before; but at the instant, when Thurles drew slightly back, and raised his arm to deal a death-stroke on his foe, the sudden wheel of a Spanish division, as it turned on one of the English flanks, completely separated the combatants.

'Almost at the same moment, Sir John Desmond shouted to O'Nial to "charge!" The Chief, springing on a fresh steed, plunged his spurs into its sides, and

dashed forwards, with his gallant hobblers, against the English line of horse.

'A chosen corps of artillery dealt a murderous fire, which volley after volley ran through the Irish army. Allen, at the moment when it raged with the greatest vengeance, seized the Sun-burst of Erin, waved it above his head, and under a shower of balls charged the British, while in a loud voice he shouted forth, "To conquest! soldiers! we are still vic—" a bullet struck the speaker to the earth, and as it did so, numbered Allen with the dead!

'A general cry of consternation burst from the Irish army; the horror and confusion which spread along their lines were increased tenfold; for, almost at the instant when the Jesuit fell lifeless on the field, Lord Thurles, dashing at full gallop into the midst of the enemy, succeeded in cutting down the papal standard to the ground. It was trampled in blood and torn into atoms by the plunging horses, whose riders furiously fought above the remnant of the banner, each man aiming the point of his sword at the throat of his antagonist. The brunt of the battle now bore down towards the spot where the corpse of Allen lay covered with the drapery of the standard he had seized, and which he still clenched, in the firm grasp of death. The guardians of the Sun-burst had rushed forwards at the critical moment of the Jesuit's fall; but failing to replant the banner, they crowded round their precious charge, which seemed to be the main mark, and the centre of the enemy's attack. The bodies of those who had died upon their posts, formed a horrid, and nearly an impassable pile about the national standard, which only a handful of living warriors now remained to defend. Seeing this, Sir John of Desmond, with the bravery of a lion, rushed through the whole of the enemy's fire, and forced his country's banner from the stifling gripe of the Jesuit. Through whirlwinds of smoke, the golden draperies of the Sun-burst glimmered, as it alternately rose and sunk with the movements of Sir John Desmond, who, sword in hand, literally cut his way through the enemy's battalions, over a field which was slippery with blood, and strewn with the wounded and the slain.

'Whirling round and round in the terrible circle which was formed by their foes, the unfortunate Irish fell into frightful tumult. Intrepid to the last, they tried to rally, but the effort was in vain; the little order that had ever prevailed among the Irish, was now entirely lost; their undisciplined numbers only increased the universal confusion, and, like a shapeless mass of human beings, acting without leaders or design, they lay almost at the mercy of the victors. Yet even at this moment of extremity, the Irish maintained their courage, and grouping themselves around Sir John of Desmond, they resolved to die as soldiers ought, upon the field of honour. A shocking struggle followed; the fate of the Irish became every moment more critical. Hemmed in as they were on all sides, even that last dreadful resource, a retreat, was apparently beyond their reach; but at the instant when it seemed the most impossible, a way was suddenly opened, by the Irish who had lain in ambush. Bursting forth from their retreat, with the fury of beasts upon their prey, those brave though undisciplined men dashed into the midst of hostile bayonets. Seized with amazement, the English at first scarcely resisted the attack, which bore down upon and overwhelmed their ranks.

'Before they had well recovered their astonishment, they found themselves involved in inextricable confusion, mixed indiscriminately with their enemies, and encountering, at the same time, the headlong charge of their antagonists, and the desperate efforts of their former foes, who, in despite of the balls, that thick as hail fell round them, forced through the English, in an attempt to gain a passage to the mountain which they had so rashly abandoned. Every inch of ground was now disputed. To have attempted any longer to withstand the superior discipline of the British soldiers, would have been an act of madness.—It was vain to fight against impossibilities, and Irish rashness yielded to English steadiness. With a heart bursting with indignant desperation, Sir John of Desmond was forced to command the little remnant of his army to retreat. The order was obeyed so slowly, that the Irish, in the act of withdrawing from the field of battle, looked more like a rallying than a routed army.

'Turning round several times, they resolutely faced their enemies, presenting the determined front of men who, even in the last hour of defeat and ruin dared to come to the closest quarters with their conquerors. At length they neared their hill of refuge. As they approached still closer to its foot, a shout of exultation broke from the harassed and almost exhausted Irish. It changed to a frantic cry, which was reverberated until it reached the skies. A startling discovery, an awful sight had caused that burst of despair. The mountain was wrapped in a sheet of flame! The wood upon its side had been set on fire by the English. The impetuous elements, aided by a strong wind, blazed from the crackling timber, and with frightful rapidity spread throughout the forest. For an instant each man stood transfixed in horror and surprise, but the next moment another electrical shout broke from the Irish, who, one and all, rushed unhesitatingly into a pass, which, though contiguous to the flames, had partially escaped them.

'The English pursued, and the tumult raged louder than ever. Yet, even amid the uproar and confusion of the awfully brilliant scene, the figures of two warriors rose pre-eminent. These were Thurles and O'Nial, who, once more closed in fight, were seen struggling together on the edge of a bare and rocky cliff, that jutted considerably outwards from the burning mountain. The top and a great part of the sides of this platform had as yet escaped the conflagration; but a circle of fire nearly surrounded its base, while in the high background the outbursting element streamed a vivid light upon the combatants, and gave their glowing figures distinctly to the view, as they fought on their rocky pedestal. With a sea of flame beneath, and a fiery heaven above them, Thurles and O'Nial pursued their frantic strife, braving horrors from which the greatest hero might have shrunk. Danger thickened to destruction. The smoke and heat grew insupportable, as the advancing flames held on their devouring progress. It became difficult, almost impossible, to breathe the stifling atmosphere; and no hope could be rationally entertained of withstanding its baneful influence beyond a few seconds.

"Yield!" cried Lord Thurles in a suffocated voice, as he made a desperate attempt to obtain a last and sure revenge.

"Never! for Geraldine is mine!" burst in a sort of choked articulation from O'Nial. Scarcely had these difficult words found utterance, when an enormous brand of burning oak dropped from a tree which blazed above the heads of the combatants, and falling with a dreadful crash between them, stopped their career of vengeance, which thus, a second time, the hand of Providence suspended. O'Nial, with the swiftness of lightning, leaped across a chasm that was now a gulph of flame, and lighting on a rock which was still untouched by the blazing element, he turned a projecting point, that gave access to a defile of the mountain.

'Thurles, springing down through volumes of smoke and flakes of fire, regained the open plain, from which his soldiers bore him to his tent half-senseless from exhaustion.'

We should not prove the full extent of our respect for a lady who has given us so much amusement, or our conviction of the certainty that she will soon have an opportunity of again revising *Geraldine*, or the importance which we attach to her example, if we concluded this article without mentioning one blemish which has offended us grievously in examining this work. We allude to the style. If we are fastidious on this point, it is because we rate very highly the importance of preserving the pure idioms of our language, and because we believe that the duty of preserving it is one for the performance of which the fair sex is specially responsible. Some authoresses of our day—and, above all, Miss Edgeworth—have acquitted themselves of this trust most nobly; some, and we grieve to reckon among them the authoress of '*Geraldine*,' have most sadly betrayed it. We are quite willing to believe that her original taste has been corrupted by the study of bad models; we see from her mottoes that she reads Macpherson and Lord Byron, two of the most corrupt authors, in point of style, existing in any country under Heaven; and, in her preface, she praises

the prose of Moore—a more guilty writer than either of them, because he has shown in his satires, and in some of his melodies, that he can write English, which they have never shown any where. The mind into which admiration of such authors has stolen, may well lose its naturally keen perception of purity in composition, and may, at last, learn to indite such a sentence as this:

'Yielding to the ascendancy of the moment, Lord Desmond and his companions insensibly sunk into that passive surrender of the thoughts and affections, in which the soul unresistingly abandons itself to the influence of external objects, and, with the fervid enthusiasm of genius, enjoys the beautiful though somewhat indistinct associations which fancy conjures up, and clothes with an authority created by her power.'—Vol. i., pp. 135—136.

Or worse still; as this, wherein are collected into the space of eight lines eight metaphysical words—a crime which with us would be perfectly unpardonable, as it would prove the authoress to have studied metaphysics, if they were not fortunately all used in a wrong sense:

'The variety of impressions that outward objects infused into Geraldine's mind, and the intensity of those inward emotions, which, abstracted from matter, overran her imagination with ideas exquisite in their nature, but overwhelming in their operation, produced a host of images too great and multiplied for the capacity of her conceptions; agitated and confused, she suddenly checked her rapid steps.'—Vol. i., p. 99.

We do trust that, before the second edition makes its appearance, (therefore it were well that they should be ordered immediately,) the authoress of these volumes will give Geraldine a set of diamonds, instead of these impressions, images, ideas, capacities, imaginations, abstractions, conceptions, intensities, outward objects, and inward emotions; and we know that young lady's sterling sense far too well not to be convinced that she will be exceedingly glad of the exchange.

There is a secret upon the subject which we would impart in confidence to the authoress of '*Geraldine*.' A great scheme is now on foot, which is pregnant with more important consequences than even the rebellion of the Earl of Desmond. It is a scheme for restoring the Old English dynasty, and for putting down the tyranny of the Rhetoricians. Does any one hint that it will fail from the strength of our enemies, and the feebleness of the force on our side, let him hear the names of our leaders. Ireland, it will be allowed, is a country in which success was most problematical. There Miss Edgeworth has been appointed Generalissima, with strict direction to execute summary justice upon any who shall offer signs of resistance. That lady received her commission in January last, and so rapid and decisive were her movements, that, in less than one month after her appointment, she forced his Majesty's Government, first, to put down the Catholic Association, which was at that time the capital of the usurper's empire. Through her manœuvres,—and herein she received the active co-operation of Sir Walter Scott, who is general of the Scotch division, supported by a great body of native Englishmen,—she procured the repeal of the Catholic disabilities, which, as every one knows, had given occasion to more vile measures of old English prerogative than any other cause whatever. The activity of Sir Walter Scott in his own neighbourhood, has not been inconsiderable. He has compelled Mr. Jeffrey, a concealed wit, and dangerous enemy of the true principles, to fly from the post which he had occupied in the field; and we understand he has threatened to put one or two of the writers in '*Blackwood's Magazine*' under arrest. He has found an able co-operator in Mr. De Quincy, and, by their joint assistance, we have no doubt that Edinburgh will be reduced to perfect submission. It was thought right to begin at these extremities of the empire; but, in the meanwhile, strong measures are in preparation elsewhere. Wordsworth in the north, with a stout band of Westmoreland yeomen, completely kept the northern bar in awe during the last circuit; and he even went so far, a proceeding which we can hardly justify, as to arrest

Mr. Brougham upon suspicion, which was the occasion of his appearing so seldom in the House of late. William Cobbett is general of division in London, and to the terror of his name it is owing that nearly all the debating societies have been put down, and that not a single debate has taken place in the House of Commons since Easter, and that 'Geraldine of Desmond' is the only fashionable novel of the least notoriety which has appeared in the same time. We are only awaiting the arrival of Savage Landor from Italy, and for some rather dilatory, though extremely resolute friends, from the two Universities, before we openly declare the country under martial law, and sentence every subject of this kingdom, who, being able to speak or write, does not write or speak good English.

We implore the authoress of 'Geraldine,' who writes and speaks extremely to the purpose, to bethink her of this heavy judgment, and to avert it by a timely declaration of allegiance. Those of her sex who are still factious, (and we cannot think without tears of the miserable fate which is reserved for those fair but devoted beings, if they persevere in useless rebellion,) will, upon the signal from her, rush to our standard, and then, as Miss Geraldine Desmond babbly remarks in these volumes, 'Victory must be ours.'

ANCIENT ORNAMENT.

A Selection of Architectural and other Ornaments Greek, Roman, and Italian, drawn from the Originals, in various Museums and Buildings in Italy. By John Jenkins and William Hosking, Architects. Carpenter and Son. London, 1829.

THE riches of the continental Museums of antiquity are conceivable only by persons who have enjoyed the good fortune to visit those precious depositories of venerable relics. A year's revenue of the most opulent empire in the world would scarcely be adequate to the expense of making known to the public, after the style and manner of their excellence would deserve, the objects of divers descriptions destined either for use or ornament, the relics of classical ages, which have been preserved in various public and private collections, and which still happily exist to bear their share of evidence to the perfection to which art, in all its branches, was carried by the ancients, and to supply the deficiency of that invention in matters of taste which unfortunately seems incompatible with the maturer age of the world. Like the quarries of certain marbles and precious stones, of which little more than mere samples remain to us, while the mines whence they were extracted are either exhausted, or lost to knowledge; the faculty whence, in the youth of mankind, were derived the exquisite lines and contours and forms, the beauty of which even the destroying hand of time has respected, seems now either worn out or concealed: and as, for modern purposes of decoration, we are reduced to work up the material which our predecessors have left us,—the Verde-antico, the Giallo-antico, and the Rosso-antico, fragments of ancient monuments,—so also in the very designs of our utensils and ornamental works of every kind, having no source of our own to which to resort for new devices, we acknowledge the necessity of applying to models come down to us as legacies from the superior intelligence of former ages. We may deem ourselves happy that our inheritance in treasures of this nature is so ample in quantity, and in quality of such exquisite perfection. As to the abundance, indeed, it would exhaust volumes, entire pages even to transcribe the mere enumeration, not of the individual articles, but of the *genera* and *species* which the learned author of the work on the Monuments of Herculaneum refers to, as preserved in the Museums of Naples alone. Forms of vessels of silver and bronze, in stone, in earth, in clay, for every sort of use, public and private, sacred as well as profane; culinary and other domestic utensils; surgical instruments, and implements of husbandry and gardening; fashions, ornaments of the person, and jewellery; hints to the dancing-master, to the dandy, the gambler, the coiffeur, may be derived

from this rich mine of models in decoration; to which, in fact, may be traced more than half the important changes in the modes, whether personal or household, which have occurred during the last hundred years.

That those alterations have been for the better, that the emancipation from the extravagant and laboured style, no less in dress and manners than in matters of decoration, which prevailed during the greater part of the last century, is a cause for congratulation, no person of sound and pure taste will deny; and we are, therefore, under obligation to all those whose labours have effected, or tend to perpetuate, the improvement, by rendering us familiar with examples of ancient art, the discovery of which has exercised so material an influence on modern embellishment. The authors of the work before us are creditors of the public on this score; they have traversed the Continent in the desire to improve their own taste and judgment in matters connected with their profession as architects, and now seek to impart, in the most accurate and accessible manner, to those who have not enjoyed the same advantages as themselves, an acquaintance with a few of the contents of the various repositories of ancient relics they have fallen in with in their travels, which are distinguished by any peculiarity of beauty or form, and are applicable to modern purposes. Their principal object is a very modest one, as we gather from a chapter of introductory letter-press which accompanies the plates, and aims, as would seem, rather more, at supplying the artisan than the architect with models for imitation.

On the subject of the application of architectural ornament to articles of use and luxury, the following remarks will be found pertinent, and probably will not prove unacceptable to our readers:

'The most accomplished nation of modern times, or rather that which was so for the five centuries preceding the last, did not confine architectural enrichments to friezes and capitals, but also employed them to give beauty and elegance to every thing on which they could be introduced. The same combinations which are sculptured on the jambs and architraves of doors and windows, are to be found on tombs and altars, on bells and ordnance,* on the earthen wine-jug of the peasant, and the golden goblet of the prince. All who have travelled in Italy must have noticed the variety and beauty of the painted decorations on the walls and ceilings even of inns and coffee-houses, particularly in those of Rome, which, though frequently ill drawn, are often very chastely designed, and certainly are more deserving of admiration than the whitened ceilings and grotesquely papered walls so much in vogue in this country. Still the art of decoration has not been wanting here. Different indeed from, but hardly less beautiful than the Greek style of ornament itself, and fully equal to that of the Romans and Italians, the Gothic style has flourished in perfection in England; but its influence was spread very little beyond its architecture, leaving room for the admission of the abominations which arose in France and Italy on the revival of architecture, that is, on the extinction of the previous good taste, and the introduction of puerile rules for general composition and detail, and the trash referred to for decoration. Architects, artists, modellers, carvers, gold and silversmiths, founders, and in fact all,—those who designed and those who executed,—those who bought and those who sold, were equally imposed on by the speciousness of style at the same time florid and meagre, made up of wiry outline or formless mass, either composed of an heterogeneous heap of leaves, shells, beasts, birds, and fishes, or a tame repetition of the same twisted stalk.

Bad taste appears to be much easier acquired than got rid of. In spite of the length of time the Hamilton vases have been in the British Museum, we still see our silversmiths execute works formed on the models of Pain and Le Pautre, and the enrichments they use are generally drawn from the same and like *classic* sources. Though the villa of Adrian, the baths of Titus, and the cities of

* There are some beautiful specimens of Venetian ornament on some brass field pieces in the arsenal at Woolwich, which, by the fortune of war, have fallen into our hands. It would not be amiss if they were referred to in the manufacture of our own.'

Herculaneum and Pompeii have discovered to us canelabra, vases, every variety of utensil for ornament and use, and internal decorations, painted, sculptured, and modelled, yet still we see the grossest and most inelegant forms in every direction, and hang our rooms with paper covered with abortions too vile to be described.

'All this may, in a certain degree, be ascribed to those who have the power, through rank or wealth, to cultivate good taste in themselves, and require it of those whom they employ, for continuing to patronize such things; and partly it may be attributed to the want of delineations and descriptions of some specimens of really beautiful enrichments to supersede those which were so profusely poured from the mint of ignorance and bad taste. For this last purpose nothing can be better than selections of Greek, Roman, and Italian Ornaments, which may in time be made to displace the other, and lead the way to original compositions in the same good taste; and with that object in view the present work was undertaken.'

—P. 3.

The work consists of five parts, each part containing five lithographic plates, with concise letter-press descriptions, in French and English. It will be sufficient to add, that the examples are selected with considerable judgment; they are in various styles, and in divers degrees of simplicity or richness: the specimens of the order of decoration which prevailed in Italy during the fourteenth and fifteenth centuries, are in a peculiar but very pleasing character, and extremely applicable to the purposes of modern ornament.

The objections that might be raised to a certain degree of stiffness apparent in the execution of some of the lithographic plates, are anticipated by the authors, who excuse themselves on this head by stating, that, with the view of ensuring fidelity of representation, and retaining the precise character of the originals, they had preferred drawing the ornaments on the stone themselves, to having them copied by a more experienced lithographic draftsman, who, to a clearer outline, might sacrifice more essential qualities. This is an appeal to critical indulgence, too just and too powerful to be refused.

Jesuitism and Methodism: a Novel, 2 vols. Saunders and Otley. London, 1829.

NOTHING can be more pitiable than the state of mind from which such a book as this must have proceeded. The bitter irritation displayed against all who differ from the author, even those whose opinions he the least understands, might perhaps be of bad example; but that the thorough imbecility of his intellect ensures that his writings must necessarily be quite ineffectual.

ENGLISH MUNICIPALITY.—The oldest municipal seal now existing, is supposed by Mr. Dalloway, to be that of Bristol. It was granted the citizens of that port by Edward the First, as lord of the castle, in an early part of his reign. The seal is skilfully engraved, and represents on one side the castle of Bristol as it stood at the time of the grant; the reverse refers to the following circumstance, not very honourable to the Bristolians of that period: A vessel having been seen at the mouth of the Avon, was invited by the inhabitants of Bristol to enter their port. Too late the foreigners perceived the snare, and that they had been decoyed into the clutches of an enemy: the crew were made prisoners, and the cargo fell a prey to their perfidious hosts.

MEMOIR OF A POPULAR AUTHOR,
LATELY DECEASED.

Mr. ——— died on last Wednesday at his lodgings in London. The public are naturally interested in a person whose writings have attained considerable celebrity; and the few particulars which we have been able to collect regarding him, are therefore entitled to a page in a literary journal.

——— was the eldest son of a respectable shoemaker at Exeter, who still survives, and whose only consolations must now be found in the practice of his profession, and in the knowledge that his son will always hold an honourable place among the worthies of Devon. The child very early displayed symptoms of that literary tendency which governed his riper genius. Of the books, however, to which his infancy was addicted, we have recovered the names only of 'Jack the Giant Killer,' and 'The History of Cock Robin;' works, the perusal of which, probably, encouraged his youthful propensity to indulge in the delights of fictitious narrative.

When he had become a schoolboy, his master frequently complained that the more abstruse studies of grammar, arithmetic, geography, and the theory of penmanship, had but little in common with his brilliant, fanciful, and eccentric character. He was distinguished for the boldness of the nocturnal exploits which he designed, and which, as he did not wish to be a monopolist of fame, he left to be executed by his companions. Being conspicuous for the rapidity with which he wrote his themes, he was on one occasion employed by them to draw up a round-robin, in which they complained of the various grievances that afflicted them. This task he willingly undertook, and accomplished it with the utmost success. But when it became necessary to sign the paper, he observed that he had already taken on himself a large responsibility; and declined to add his name to those of the other pupils.

If some future historian shall discover this document, and eagerly examine its time-worn page, in the hope of detecting the name of the youthful ———, how bitter is the disappointment that awaits him, how unfortunate this *lacuna* in the archives of Exeter!

In consequence of the absence of his name from the paper, he was not included in the general punishment for that rebellious manifesto, which consisted in a deprivation of butter at breakfast during the next month. His father looked on this circumstance as an omen that through life he would know how to 'butter his bread.' How miserably, alas! in some periods of his existence, was this prognostic frustrated!

Before his boyhood had passed away, ——— became a rival of the most literary mantuamakers in the intensity of his devotion to the circulating library. Their emulous delight in novel-reading speedily was a bond of sympathy between those interesting females and himself. The maidens wept with the youth over the exalted miseries of Rosalia, and the sublime suicide of Alphonso. ——— soon became an unequalled inditer of Valentines, and was considered, at many of the tea-tables of Exeter, a young gentleman of the highest promise. His father was delighted at the budding indications of future glory; and, on his son observing that he confessed himself to have a soul above grammar, the affectionate parent withdrew him from school, and sent him into the office of a solicitor. ——— was now sixteen. His breast was filled with the examples of heroes in black mantles, and lovers with bleeding wounds. But his hand was bound to the desk of a scrivener, and his great mind had no opportunities of expanding its wings, except at the evening parties, where he was the delight of bright eyes and feeling hearts; and on the Sunday afternoons, when, in white trousers, with a switch in his hand and a pink in his button-hole, he was the admiration of the multitude, and the more cherished idol of the few who love and reverence the aspirations of youthful genius.

Miss ———, the assistant of a milliner, was the fair object of his early passion. Her wonder at his

eloquence and fancy was uninterrupted; her confidence in his faith unbounded. She felt that they were congenial minds; and he thought her the loveliest of women. Alas! that love should ever end in sorrow! That our hearts cannot become their own sweet law! That the most delightful of emotions should produce the deepest wretchedness! Before ——— was eighteen, the stern satellites of municipal tyranny presented themselves like messengers of evil fate at the abode of his sire, and demanded compensation for the burthen thrown upon the parish in consequence of the two susceptible weakness of Miss ———.

The full weight of paternal indignation now burst on the unhappy ———. The old man paid, indeed, the miserable yellow dust demanded by the ministers of parochial cruelty; but, unacquainted with the generous magnanimity of the sage, he visited on his unfortunate offspring the effects of fervent passion and malignant stars. He seized, in the chamber of the youth, the volumes of the mysterious Ratcliffe and the eloquent Lewis, marked as they were by the tears and fingers of the lovers, and committed them to the culinary pyre; and to these, irreparable destruction! he added the blotted and irregular manuscripts, the produce of his son's inspired vigils, and those brief epistles from the hand of the fair mourner, ———, in which tenderness and constancy so beautifully struggled, like midnight luminaries, through the silver mist of neglected grammar and lawless orthography. He commanded the young man for ever to abandon the beloved of his heart, and to confine his literary studies and labours to the exercise of his profession. But the youth replied that his spirit was too free for drudgery, and his affections too profound to be so lightly withdrawn from Miss ———. His father drove him from the house, and he went to the abode of his mistress. She was absent; and he did not find her till she was standing at the altar, and giving her faith to an eminent tobacconist.

Seared at heart, and solitary, and desperate, ——— fled from his native city, and began to lead that wandering and adventurous life which enabled him to exhibit in his after-writings so intimate and various a knowledge of society. Of this portion of his existence we have succeeded in recovering no more than a few scattered notices. We have been informed that at the age of about three-and-twenty, he made his appearance on the Bristol stage, in the character of Lear; but his conception of the personage is said to have been so lofty and complex, so far superior to the design of Shakspeare, that it was impossible even for his powers to present it in all its extent and energy, on an ordinary stage. His failure, however (for so it was called), was of a nature to warrant a higher estimate of his powers than of those of the most successful performers.

The candour, and as it were the universality of his mind, enabled him to perceive how much there is of truth in all human opinions; and thus it was that without doing violence to the delicacy of his conscience, he was successively editor of a radical newspaper at Litchfield, contributor to a Calvinistic and Tory Magazine in Dublin, and Old Bailey reporter for a Whig Journal in London. But he was discontented with this narrow sphere; and, remembering at the age of thirty his early occupations, he became eager to proclaim himself a poet. In the interval of his forensic labours at Newgate, he employed himself in the composition of several short pieces of verse, in which he told of his high aspirations and adverse fate; recalled, with all the fondness of Orpheus wailing for Eurydice, his early love, Miss ———, long since Mrs. Samuel Pigtail; and announced the agonies of baffled hope, and his contempt for existence, and for all mankind, and his sullen independence of the world. He then procured an introduction to a bookseller, and, having brushed his coat, and put the MSS. in his pocket, presented himself in the shop of the tradesman. The author made his most polished bow, and with the condescension inseparable from genius, began to talk of the bibliopole's high character for judgment, liberality, and so forth. The tradesman's brow grew black, and he interrupted him with 'Beg your pardon,—pray pro-

ceed to business,—time very much occupied.' Mr. ——— grew pale, and trembled, while he drew forth the bundle of paper, and laid it on the desk. 'Eh! eh! what's this, sir, O——h? A——h! I see, I see! Songs of Sorrow, eh? or the Agonies of Anastasius, eh? Pay for copyright, eh? Beg your pardon, sir, but I presume these are written by a very young lady—had thirteen volumes of sorrowful minor poems last week from the Ladies' Academies at Highgate and Clapham. Nothing of this sort sold ten copies for the last five years.' And, so saying, the bookseller turned his back, and the high-souled and misanthropic poet left the shop of this ignorant and pettifogging pedlar of literature.

It is the privilege of great minds not to be overcome by misfortune or depressed by the ingratitude of the world. Mr. ——— strengthened himself against his opposing destiny by the use of those physical restoratives which he had always found most favourable to the exertion of his powers, broiled *lamine*, namely, of beef, and the complicated liquor for which London is celebrated, and which enters so largely into the formation of that unrivalled specimen of human nature, the English character. Thus invigorated from without, and morally sustained from within, he wrote a tragedy, which he offered to one of the patent theatres. The fatal confidence of resplendent minds which teaches them to rely on themselves without sufficiently considering the state of society, and the circumstances in which they are placed, induced him to relinquish his employment as reporter, and to devote himself to the theatre. Here he was occupied in endless negotiations with managers and actors, which called forth the most admirable resources of his talents. But unhappily, delay,—delay, the adverse power which ruined Hannibal, and which annually gives up thousands to perdition, delay was victorious even over ———. While engaged in frightening scene-shifters by his eloquence, and winning by the charms of his approbation the favour of the green-room, his purse grew daily lighter and lighter. The fierceness of scorn and hatred came over his soul; he fell asleep amid visions of the theatre in flames, and the rescue of his tragedy by the interposition of Urania and Shakspeare; but, alas! he scarcely woke until he found himself in that abode of injured innocence and outraged merit, the King's Bench Prison.

Here he met with a number of individuals, who, though misunderstood or trampled on by the world, were filled with a spirit akin in strength and brightness to his own. One of these, a man declined in years, but to whom every day of existence had given wisdom, was particularly attracted by the free and calm superiority with which Mr. ——— felt and expressed himself towards all orders of society. They became friends and companions. Mr. ——— found that the old man had been a sedulous and successful writer, and had nourished by his pen the reputations of a score of periodicals. He died while ——— was in prison, and his last advice was this, 'My friend! my friend! write a fashionable novel.'

Mr. ——— meditated profoundly on the advice of his departed friend. 'True,' he thought, 'I have never been in fashionable society. What then? Neither have the majority of my readers. True, I have no knowledge of the costumes, characters, or manners of the persons whom I am to describe. Pooh! I need only make them strange enough, and I shall be sure to excite interest. He immediately began to compose his novel. Coat or cravat he had none; (such is the scorn and such the folly of the world; and to a like fate have been reduced Camoens, Cervantes, and Otway;) his inferior garments were tattered, and he wanted the means of repairing them; yet did his creative imagination enable him to conceive the persons of gartered nobles and glittering ladies. The scenes among which he placed his actors were the parks and gardens of princely mansions, and the lofty halls of London palaces hung with silken draperies and precious pictures; yet, while he was describing these abodes of splendour and haunts of fancy, he was seated in a room without any furniture but the chair and table

which he was using, walls, floor, and ceiling stained with dirt, squalid, dreary, and dilapidated. There was no less singular a contrast between the conversation which he heard and that which he recorded. Oaths and clamours filled the air around him, squabbles for porter and tobacco, the exclamations of gamblers, and the songs of turbulent pauperism. But Mr. ——— was compelled, by his resolution of becoming a popular author, to narrate dialogues of mincing and delicate affectation, and to cover page after page with tame, apathetic nothings, or with profligacy the most gentle and unconscious.

His triumph, however, was magnificent. Mr. Colburn gave five hundred pounds for his three volumes. Mr. ——— became one of the 'lions' of the season with almost every body in London, except, perhaps, those of the class which he had attempted to describe. His opinion was asked confidentially on horses, wines, coats, caps, dishes, and poetry; and he found himself in truth the 'popular author' of a 'fashionable novel.' Happening to travel in the West of England, he was received with enthusiasm as a member of three literary societies; and in the streets of Exeter, Mrs. Samuel Pigtail looked penitent, and endeavoured to obtain a favouring glance. But Mr. ———'s sense of the difference between right and wrong did not permit him to relent, and he declined to renew his acquaintance with her.

He obtained eight hundred pounds for another novel; and he was thinking of becoming a fellow of the Royal Society of Literature, and of purchasing an old cabriolet, which had broken down in France, but might perhaps succeed better on English roads, when he was suddenly carried off by an indigestion, leaving a gap in English literature, which, in spite of the number of his rivals, will not readily be filled up.

HAMPSTEAD HEATH.

ONCE more, with joyous spirit uncontroll'd
And light of heart, as he, who set at large
But one day in the year, delighted bounds
Through Epping Forest, when the hunt is up,
I wander, Hampstead, on thy pleasant hills.
How beautiful the country does appear!
How very pleasant is the month of June!
How sight and sound combine to make us glad!
The green leaves dance to the merry-making song
Of the young birds; while greener parasols
Glance in the sunlight, and at intervals
Wav'd like the leaves by Zephyr's wing, let forth
Sweet murmurs from the laughter-loving fair.
Now the witch Memory weaves her subtle spells,
And in this lonely nook, where plenteous grass
And overhanging trees invite repose,
With visions of the past enchants the mind.
'Tis seven long summer days, laborious week
Of careful toil, since last I lingered here.
Yon little ass that twirls his long ear round
So tenderly to warn th' incumbent flies
That tickle but not hurt him, (how I love
His meekness, his benevolence humane!)
Yon little ass was here last Sunday morn,
And near this very spot; I know him well.
And by his conscious eyes I guess that he
Remembereth me, as I remember him:
Two hours we ruminated here together,
He chewing grass, I Fancy's bitter cud
Pensive, not pleased; for coming things had cast
Their shadows on my soul, and I was sad.
I thought, for so the newspapers had said,
That Hampstead Heath was soon to be enclos'd.
'What then,' I cried, indignant, for the muse
Had warm'd my bosom with a generous flame
Of holy wrath, 'shall these majestic hills,
These heathery mountain wilds, which heav'n design'd
To tower eternal o'er the works of man,
Be trimm'd to garden walks and villa walls?
Shall yon expansive waste (I love all waste
And solitary places,) yon fair furze,
Yon boundless garden of purpureal bloom,
Unfruitful Eden, blat sterility,
Give place to unromantic crops of corn?

No more shall we, poor prisoners of the town,
Walk forth to breathe the gentle breath of May,
And with the earliest fashions of the year
Outvie her modest blooms. Ah! here no mo
Shall dainty *lady-smocks* arrange their groups
Of doubtful white; no *dandy-lions* here,
No undulating *swells*, no *coves* in green
And velvet vesture clad shall charm our eyes;
No well-known smell of *city-wall* be found.
No more the hoary sire from weekly toil
Of counting-house reliev'd, with portly spouse,
And children Sunday-dress'd, shall turn his eyes
To yon dun ocean of incumbent smoke,
(Like ship-wreck'd mariner escaped) wherein
Lie buried all his treasures and his cares,
All, save the cares and treasures at his side.
No more shall wanderer, studious of the muse,
While the slant sunbeams break yon column'd mass
Of cloud, and through the gilded fragments shew
Dim heaps of temples, palaces, and towers,
Rising like dream-land upon Fancy's ken,
Stand here, and with fixed eye and folded arms
Forget the world, his mistress, and his duns.
Shall such things be while men have souls to think,
Arms to gesticulate, and tongues to utter?
Avert it, Heaven! forbid it, House of Commons!
Redeem your credit; a disgraceful sessions
With wisdom crown; nor let a second bill,
Like that which curs'd the country, curse the town.'

I spoke: the House of Commons could not hear
Or know my prayer; but Heaven is over all,
And the many-voiced wish that rose aloft
From lowly hearts and humble lips like mine
Prevail'd: the House of Commons quash'd the bill.
Therefore rejoice, oh! Hampstead; hop ye high,
Ye little hills; ye furry wilds, look grand;
Shake off your dust, ye leaves, look doubly green;
Ye birds, with *treble* notes, enchant the air:
And you triumphant smoke-dried multitudes,
Struggling from Wapping westward through the Bar,
Lift up your voices, shout aloud for joy.
And ring the bells of Dunstan and Lebow!
For Hampstead Heath survives, and evermore
Shall love, romance, and poetry be found
With pleasure, health, and joy on Hampstead Hill.
There Jupiters may still with Maia's rove,
There Mercuries of the Times and Morning Post
Stand tiptoe upon heaven-kissing hills;
Mars of the clinking heel and whisker'd lip
Walk arm in arm with Venus; Hercules
Treat Hebe to repeated pots of beer;
Apollo drive nine sisters in one car;
Bacchus get drunk alone; and every grace
Flirt with her favour'd swain on Hampstead Hill.

THE CURATE.—A TALE.

(Continued from page 350.)

THREE years went by
In offices of cold civility,
While more retired from day to day he grew:
Judge then with what surprise all men who knew
His proud and cold heart, heard that he had wed
A gay and lovely maiden: one whose bed
The richest and the noblest sought in vain!
And much men marvelled, she whom all the pain
Of gay and youthful lovers could not move,
With such affection should bestow her love
On one so rude as he: and oh! men say
That she was lovely as the young spring day
Which trips along the misty hill-tops, clad
With dewy fragrant clouds, and maketh glad
The birds, o'er-wearied, watching at the fold:
And that the fawn, which o'er the mountains old
Goes bounding, is less sportive:—her sad tale
Makes ever my blood boil. Care-worn and pale
Her portrait is; upon her scraph's face
Sorrow hath drawn deep lines, striving to erase
The indwelling beauty: 'twas not years that wrought
This change—not years! For the swift months had
brought
The sun but twice unto his goal, when she
Had this sad portrait done, that it might be

Her only son's memorial of a friend
Whom he was soon to lose. Unto the end
A mystery it remained how Hardyng won
This gentle creature: yet I think that one
Wh through all varied shapes of life had been,
Had wandered far through many a savage scene,
Had rode o'er desert steppes, had ploughed the main
Towards Araby and India, well might gain
The affections of a simple girl, who knew
That she was weak, and strove to find some true,
Some stable rest without herself. To me
More strange it ever seemed, that such as he
Should care to gain her: but, perchance, 'twas pride
And rivalry which burned to win the bride
So many sought; or that she was allied
To a renowned line. Perhaps he thought
He loved her truly when her hand he sought,
For sometimes cloaked self-love deceives our heart
Even to this; so roughness laid apart,
He wooed and won her. Be this as it may—
Love soon was fled, and she from day to day
Became less joyous. Ellen, I have seen
All shapes of desolation: I have been
Where man, at war with nature, had upturn
The glory of the woods; have seen the shorn
And shredded foliage into miry clay
Down trodden by men's feet on the highway;
Have seen tall castles-mingling with the soil
On which they rose: but nought hath power to spoil
Creation of its beauty, as deep love
Wanting return; when warm hearts cannot move
The hearts to which they're linked, but linger on
By their own flame consumed, till all is gone
Which fed them—gladness, mirth, and hope; and then
Nothing is left but death! These torments men
Regard not, oft breaking by slow decay
Hearts that with too much joy have caught the ray
Sent from a holier sphere; and oh! how few,
E'en loving most, can love as women do!
This sweet girl loved too well! Love was her life,
Which wanting, life must fade. He, as a wife
Bearing his name, with proud civility
Would greet her; and a distant courtesy
Unto the last affected; 'what may do
Such, given for love, but tear the heart in two!
As hers it rent—in few words let me close
This painful tale—Death ends all earthly woes!
And hers it ended. One young child was left
An orphan in a widowed house, bereft
Of all parental love; for the sweet joy
A father shares with his beloved boy
Poor Walter never knew: for the old man's heart
Grew harder with his years, till by the art
Of some hot schismatic impostor, he said,
That for wild deeds in early youth displayed
Stern penance must be done; so he retired
Still more from men, sold all his lands, and hired
A gloomy house among the mountains: then
Strangely the days went by; loud, noisy men
Wrangling surrounded him, till he their creed
Severe adopting, from his hold decreed
This right, that wrong, a fierce polemic wild,
With men and with himself unreconciled.
How Walter 'scaped I scarce can tell; but he,
If men were fierce, found nature's love was free,
And when with angry doctrine filled, and made
At variance with himself, he sought the shade
Of the o'er-hanging mountain, traced the brook
Up to its source, and in the eternal book
God's visible gospel read, in stars revealed,
Fountains and stones, in cavern and in field!
Think we that stones are dumb? No! Though we
strain
Each nerve to be cold, heartless things, in vain
We strive with our own souls. There's not a sound,
A sight, that moves beneath yon vault profound,
But hath its task appointed; but must wake
Ten thousand primal sympathies, which make
Their dwelling in our heart of hearts, a soul
Within our soul, by no impure control
Of earthly incantations o'er bow'd down
From their eternal throne; must find us, thrown
By rill or waterfall, in forest glade,
Or cave, or temple, or the mossy shade

Of colleges and cloisters. To the wind
Give hateful systems, which make brothers blind
Until they smite each other! We will keep
Our better hope, and read yon azure deep,
There find the mystery of our death and life,
There gaze on harmony that shuts out strife,
And see by God's forefinger graven the sign
That love, and love alone, can make this dust divine.
Driven from his home, with heart and head confused,
Upon the hills young Walter better mused
Than in the house of Rimmon: so he grew
In love to all; till in its season due
Came manly form, and on his gentle face
The beauty he pursued might all men trace,
The gift of stars and streams. At length, when time
Had raised the stripling into manhood's prime,
Won by much intercession, slow consent
His father gave that Walter should be sent
To tread the halls Barrow and Milton trod:
With stern remonstrance that the word of God
He should preserve unstained in Babylon,
The purple Hierarchs e'en at the altar-stone
Defying, if need were; for that the place
Had lost the seed of saints, whom heavenly grace
Raised up to strike oppression on the throne,
And in the mitre.—As I said, alone
Walter had lived, because he found no love
Among his kind: this soon was changed; the grove
Ceased to be all-sufficing, life brought fears,
Hopes, duties; now he mingled with his peers,
And if sometimes he witnessed hate and guile,
Ill guided rivalry and pride; the smile
Of a kind friend to whom he poured the tale
Of golden-winged hope, how might prevail
The lofty virtues which should sweep away
Sorrow and shame from men, and how a day
Might come when all harsh thoughts should sink to
sleep.

And heaven be found on earth; this smile could steep
His soul in loftiest feelings, noblest pleasure,
Gifts wealthier than nature's wealthiest treasure,
Could teach him that though wounded hearts may love
Through all the visible universe to rove
In quest of peace, peace man can only find
In commerce with himself, and with his kind.
This knowledge, bought by sad experience, he
Gave early to my thought; and oh, in thee,
My love, how true I find it. I have been
So tempted, e'en as he; I, too, have seen
My shame, my woe, and what through all upheld
My soul but thou, in whom my eye beheld
All objects of all love, whom, like a shield,
I've thrown before my heart! So Walter taught
In earlier years, ere manhood on me brought
Its cares. Now wrapt in science he pursued
The secret laws of nature; or imbued
With philosophic lore, unrolled the page
Of the inspired Plato, whom the age
Of blinking sophists ever with their sneers
Assail; more guilty in those latter years,
Than ere the light on man was shed from heaven,
For few could then believe what now 'tis given
Even to the meanest villager to know.

(To be continued.)

THE DRAMA.

King's Theatre, Saturday.

ONE might fancy that the spirit of Rossini, driven for a little while from its old resting-place, chuckled as it went, and whispered the pleasant words, 'Mi rivedrai.' The wag might well afford to be good humoured on the occasion, for his banishment lasted but a single week, and here he is again in all the glory of his ancient popularity. 'Tancredi' has filled the theatre as much as ever; and it would be to our perfect pleasure if each of those artists who now so excellently support it, were to assure us that its beauty will be withdrawn from us only for a season, by quoting the same comfortable expression, 'Mi rivedrai.' Any detailed account of a performance so well known would be now unnecessary. The novelty in the present representation is the appearance of Madame Malibran in the part of Tan-

credi; and, perhaps, a general air of newness is suffused over the whole opera by means of this single change. Much assuredly of that which is most backened in our eyes and ears, has assumed a modified and regenerated form, inasmuch as the quality of her voice, and style of acting, are in themselves new, and insinuate a new effect into all the concerted scenes of the opera. The performance of this character is distinguished by all the life, and force, and variety which belong almost exclusively to Madame Malibran. No torpor nor feebleness vitiates the prevailing vigour of her style. The very redundancy of which we have sometimes complained, is glossed over by the hazy lustre of the atmosphere in which she moves. How singularly unlike the quiet majesty, the intellectual nobleness, with which her predecessor in the character filled the soul of her auditory; and yet, how near a rival, how bewitching, how talented, how wonderful!

The celebrated recitative, 'Oh! patria!' was delivered with much precision of tone and dramatic fitness of expression; and, perhaps, not even Pasta so well represented the eager energy of a pilgrim greeting his native soil. The air which succeeds it had the honour of an encore,—no slight triumph when achieved only one short twelvemonth after our hearing the 'Di tanti palpiti' of the true Tancredi. But these detached efforts had not, after all, the same richness of effect as some of the combined pieces of music, in which her own admirable singing was filled out and made perfect by harmony with that of Mademoiselle Sontag, whose personation of Amenaide is as graceful and interesting as ever. Nothing can exceed the sweetness of the union of these two voices. No instruments, prepared by the finest art, ever attained a more perfect and reciprocal nicety of tune. No birds, 'sitting upon the forest's midmost tree,' poured forth notes more silvery and flowing. And, to carry to the highest possible degree of beauty this common and equal charm, art and industry have been diligently employed to adapt themselves each to the other; so that their ornaments and variations are like the flights of mated birds; their wings are spread together and twinkle in the air—they rise or sink, and float here and there, in circles or angles, or straight onwards; but still inseparable as at first, their pinions keeping the same aerial track, their bodies almost commingled. Their duets are like a succession of the sweetest of earthly sounds heard simultaneously with their echoes; and, in the minute cadences and florid interpolations, the effect of these quick reverberations is almost miraculous. We refer to the 'Lasciami, non t'ascolto,' and 'L'aura che intorno spira,' for a corroboration of our words. Any one, indeed, who has heard Madame Malibran and Mademoiselle Sontag apart, will be able to form a shrewd conjecture that their singing together is likely to be one of the most brilliant and delicious forms in which music can be presented. The latter especially exhibits in this opera the abundant riches of her style; and, now and then, as, for instance, in the air, 'Giusto ciel che umile adoro,' addresses us with a tenderness not merely passive. In mentioning the concerted pieces, we should not forget the happy execution of the sextett at the close of the first act, which demands much accuracy and care, in addition to the strength of voice usually employed in it. Curioni's Argirio is well, and, we doubt not, favourably, remembered by our readers.

French Theatre.

THE theatre closed for the season on Friday night. Jenny Vertpré, acted in 'Le Médecin des Dames,' 'La Femme Châta,' and 'Yelva ou l'Orpheline Russe.' There was besides a very amusing little novelty, in one act, called 'Le Bouffe et le Tailleur.'

The lady who pretends to have been a cat is one of the most favourite of Madlle. Vertpré's parts. The idea might appear almost too fantastic were not the character rendered a part of nature by her acting. The explanations hurt the effect of this vaudeville. Had the plot been a regular fairy tale, and Jenny a young lady who had really been a cat, we should have felt that her acting was a perfect representation of the

union of the feminine and feline characters. We could not have laughed more to be sure; but we should not have had the puzzling impression that she was after all only representing an actress.

We were, however, even more curious to see 'Yelva,' because we had witnessed the performance of a translation of it at Covent Garden. Nothing was ever more decidedly, nothing ever more deservedly damned by a British audience: and though we knew how much dulness may be added by our national translators and actors, we could not conceive that the original could have possessed merits which had been so carefully excluded from the translation. The plot of the vaudeville is rather meagre; the dialogue does not exhibit as much lightness and wit as the generality of its kind. It is made an admirable acting piece by admirable acting alone. There was deep tragic power in Vertpré's performance of the dumb girl. There was never more expression put into a single word than into the 'toujours' with which she answers her lover at the end. She is indeed a charming actress, and may elicit much admiration even from those who have seen Madame Malibran.

The manager's speech at the close of the session was as dignified and significant as most sessional addresses. The man seemed actually overpowered by his feelings of deep gratitude. A Frenchman does not live in humbug as an Englishman does; but the very rarity with which he has recourse to it makes him use it with more spirit and skill.

We take leave, with great regret, of the only rational dramatic amusement which, with the exception of the Opera, is permitted in London. On the English stage there is some good farce, much of the delicate amusement which is derived from vulgarity and indecency, much show, much noise, but hardly any acting. We do not mean to say that there are not very good actors and actresses on the English stage: but even these rarely act well, because they have a laudable wish to gratify the public; and the public liking any thing but nature, she has been expelled violently from our theatres; and unfortunately has not shown the pertinacious tendency to return, which is imputed to her by Horace.

The French company in London is, for a French company, decidedly bad. But still it is a body of actors and actresses who do not shock, if they do not satisfy our taste. These people act, and act with spirit. Each person has a particular part, and performs it in such a manner as to contribute to the effect of the whole. On the English stage, each performer appears to go through his own part with a most perfect indifference to the rest. A good actor sometimes appears to conceive and represent his part; but his effect is always marred by the intolerable slovenliness and stupidity of the rest of the company. The great fault of the English stage is, the total neglect of the inferior parts. The quota of merit necessary to play these parts is less than is required for the higher; but to the good effect of the whole piece, the presence of these smaller portions of good acting is as necessary as that of the greater.

The British public, to be sure, have learnt to appreciate the French comedy. They console their national vanity by supposing that they have a better tragic stage; they think that the 'Mahomet' and 'Cid' are the tragedies of the French. But these are the tragedies of the Théâtre Français, not of the French people. The real French tragedy, like the comedy, is to be found in the vaudeville. Like their comedy, it is true to nature: and like that, the best acted, the most moral, and the most intellectual of any dramatic performance in Europe.

The managers may next season improve their standing company; they may give us rather a greater variety of the first-rate French performers; they may correct the great delay which wastes so much time between the acts. But as we wish to part on good terms with them, we must praise them for a singular, and in our eyes, a great merit. Their theatre is the only one in London which has confined itself to its proper language and class of performances. At the Italian Opera-House we have had French performers

acting English; and at the theatres royal German singers have sung in an unknown tongue. Men act women's parts; women seem almost to have thrust the male sex from the performance of male characters. At the French theatre the public applause has not been courted by any such tricks. Madame Malibran once sung there; but she can never be out of her proper element. The visits of angels may appear inexplicable, but must always be welcome.

The Duke of Gloucester honoured the evening's entertainments with his presence. We were happy to see that his Royal Highness looked remarkably well, and appeared much gratified with the performances.

Vauxhall Gardens.

THE anniversary of the battle of Waterloo has, as usual, been celebrated at these Gardens, by grand and attractive galas. The greatest novelty is an Italian opera buffa. How little would such an event as the representation of an Italian opera, at a popular place of amusement, been dreamt of ten years ago. Yet this spacious concert-room was thronged, and the lively music of Rossini was unequivocally enjoyed. The Cenerentola was judiciously selected for the occasion. Miss Fanny Ayton performed Cenerentola and Pellegrini Dandini with happy effect. The airs should be translated for the benefit of the non-Italian part of the audience. The fireworks have been ingenious and clever in design, and most brilliant in effect.

French Readings.

WE regret having been prevented attending the first of the Lectures Dramatiques of M. P. Victor, at the Argyll Rooms. We shall not fail to be present at the subsequent readings, which we observe are fixed for the 24th, 26th, and 29th of this month, and to duly report on them.

MR. BOCHSA'S CONCERT.

NOW of the phenomena of the season have worn so imposing an aspect as the placards studded with every type and character of print, prospective of Mr. Bochsa's Concert. Everywhere was the eye greeted with this same promise of good things to come; and the gourmand might be seen loitering at the shop windows to feast himself upon the Bill of Fare, even though he had no thought of partaking in the feast it announced. Heavens! what awful rivalry of the venerable Ude! Such a display of side dishes had never before been exhibited to the musical world. Listen ye who have been idle or on a low diet, and excluded from this banquet. First came Acis and Galatea, with Braham and Miss Paton, as the love-principals; Begrez and Miss Byfield as subordinates, and Signor Zucchelli as Polypheme. Next, M. Bochsa played a concerto on the harp. Then followed the final scenes of Romeo e Giulietta, supported by Madame Malibran and Mademoiselle Sontag. Next, a violoncello concerto by Mr. Bohrer. Next, a grand Scena, from Rossini's 'Ciro in Babilonia,' Madame Pisoni personating the hero. Next came the Overture to the Freyschutz, succeeded by a portion of the Second Act, in which Mademoiselle Sontag and her sister appeared as Agata and Annchen. After this came the Juno di Morte of Meyerbeer, with Donzelli as Adriano. Then a Duet between Bochsa and Tulon; an epitome of Spontini's Vestale, which brought before us Mademoiselle Blasis, Curioni, Begrez, and a M. Valner.—After which and lastly arrived an arrangement of Beethoven's Symphonie Pastorale, as a Ballet, being a tolerable dessert to a sufficient repast, as we before said.

Of the motives which influenced M. Bochsa in making out this list of attractions, little need be said by way of conjecture. He is a clever man, and knew well enough, that at this late period of the season, any orthodox and ordinary allurements would be useless. Curiosity, legitimate or not, was all he strove to excite, and certainly the fulness of the house proved that he had accomplished his aim. But, setting aside the cleverness of the device,—the ingenuity, industry, and toil necessary to gather together and keep in good order such an anomalous

troop as those he had to marshal, we must not hesitate to say that the experiment is a dangerous one both in itself and in its consequences. The greediness of many would be provoked by the length and number of the entertainments thus offered to them, but human nature is weak, and not one of the hundreds who were assembled at the theatre on Monday night, could, we are persuaded, have endured to the end without fatigue. This is an accompaniment that tells badly at the time, but still worse afterwards. An unpleasant feeling is associated with the idea of a concert, or even of music itself; and to go again would be an undertaking and an effort which one could not fail to look at with some little disinclination. As for the practice of expressing the rich essence out of longer compositions, and offering it in a reduced shape, we are quite sure this has a pernicious influence on the general taste, and the collecting and contrasting a vast number of such tit-bits, wearies the palate and weakens the capacity of enjoyment,—It is not wholesome. But of this empiricism *jam satis*.

Acis and Galatea would have gone off tamely but for Zucchelli's noble personation of the one-eyed monster. Braham had no controul over his voice, and sang not only flat and sharp alternately, but commingled his notes in such a way, that one might speculate on the division between them being entirely lost some day or other, and one single burst of sound comprising the whole gamut. Miss Byfield shows some power but much awkwardness, and Miss Paton always needed an expressiveness of tone to make her singing first-rate. But Polypheme!—Nothing was more perfect, or more effective in the whole collection. The air that he sings upon his entrance, 'Oh! ruddier than the cherry! Oh! sweeter than the berry, &c.' was literally blocked up by the applause of the house. It was the most vigorous and finished bass singing we remember. The celebrated trio, 'The flocks shall leave the mountains,' gave us much pleasure; for Braham's piano, strange to say, was better than his forte, and the delicacy of these passages showed that the galleries have not quite spoiled the finest tenor voice that our generation and our fathers have known. Bochsa's concerto was an ingenious grouping of some Irish Melodies, or rather of subjects broken off from them, into one elaborate whole. Perhaps our ears are sometimes alike offended with these liberties taken with old friends; and perhaps the gems in themselves are almost lost in the rich chasing and embossed work in which they are set. However, the audience was well satisfied, as they ought to have been, on the whole, for with the exception of a little failure in the harmonies, the performance was both masterly and agreeable. Of Romeo e Giulietta we are inclined to say nothing. It was a harrowing and most extraordinary display of power, which we had rather continue to *feel*, than stand a chance of forgetting by methodizing and explaining our feelings. Our language would be too rapturous for criticism, and so we pass on to M. Bohrer, whose violoncello grunted with remarkable fluency and skill; not so roundly and melodiously as that of our old friend Lindley, but in a polished and most agile manner, that confirmed in our minds the distinction between the English taste for tone and the French for execution. Madame Pisoni's *Ciro* was as energetic as her performances usually are, and could not have a better relief than the next succeeding extract from Der Freyschutz preceded by the overture not very well played. The pretty accents of the German Sisters made musical the gutturals of their language—and the simplicity of their action, the purity of their style, and in the elder of the two, the wonderful command and refinement of science, made this scene as attractive as any throughout the evening. The conclusion of Agata's song was given with more than the usual force of Mademoiselle Sontag, and justifies an opinion stated by us a year ago, that the operatic renown of this lady is dependent on her efforts in the dramas of her own language, and not likely to be advanced by any representation of an Italian character. Donzelli's *Inno di Morte* was truly grand. If any one chanced to be slumbering about the time of his appearance, certain are we,

that their senses were sufficiently bestirred by this magnificent burst of music. The reaction, however, was perilous. Sometime about half way through the following instrumental duet, we fell into a soft trance, from which neither Spontini nor Beethoven could awaken us. We got home by day light.

MADemoiselle SONTAG'S BENEFIT.

WE are almost sorry to take any notice of Mademoiselle Sontag's benefit on Thursday. We could have wished that that charming lady had not taken so much pains to please us. We should have been quite content with either Zaubertote or Tancredi. The British people like a great heap of articles for their money; and they have been abundantly supplied with odds and ends of Operas this season. It was bad enough to have (as we have constantly had this season), two acts of different Operas the same night: but Zaubertote was not maimed but squeezed to death. The two acts were crunched up together, and some of the best music pressed out. The 'Times', we see, speaks with great approbation of the 'Selections.' The judicious critic who instructs the musical world of Europe in its 'leading Journal', appears to be delighted with every thing at the Opera House, except Madame Malibran. He mentions Madame Castelli's impersonation of the page in 'Le Nozze,' as a specimen of musical and histrionic optimism. We wonder who writes these notices in the 'Times.' 'Aut Diabolus aut Castelli,' we are almost inclined to answer. But, surely, though that lady might be partial to her own merits, there can be no musical taste except that of the fiend that could gloat with satisfaction over the bedevilment of Cherubino and Zaubertote. The German singers were well received. Romer has a fine tenor voice, and sings with taste. Schutz is a good Buffo: his duet with Sontag was encored. Nina Sontag is apparently very young: she has a great share of her sister's beauty. Of her singing it was impossible to form any judgment from one air in which she was excessively frightened. But there appears to be a spirit and lightness in her acting, the want of which, is the only circumstance that shows that her sister is liable to human imperfections.

We trust that we shall have 'Zaubertote' at full length before the end of the season. To be sure, it would be better as 'Il flauto magico.' The cacophony of what the Germans call their *language*, is offensive to Christian ears.

We were excessively sorry to see the house so thin on such an occasion. One fourth of the boxes appeared to be untenanted. It seems hardly fair dealing in M. Laporte to fix Mademoiselle Sontag's benefit for the evening of the great day at Ascot. Even if it was her choice, he ought to have rectified her error; for he must have known, what she might not suspect, that the English nobility and gentry would desert her sweet strains for the pleasure of seeing a dozen lanky horses flogged and spurred round a field. Laporte should have taken better care of the interests of one whose various charms have been so great an attraction to his theatre.

Sontag and Malibran appeared on the stage after the fall of the curtain. Flowers and garlands were showered on Sontag, who selected a wreath and offered it to Madame Malibran.

A new Ballet was produced at this Theatre on Tuesday. There is no plot: the scenery is Tyrolese, and exceedingly beautiful. The galloppade at the close was admirably executed, and much applauded.

FINE ARTS.

THE BRITISH INSTITUTION.

WE would not for the world partake the opinion which our contemporaries of very opposite characters seem to entertain of the higher and more opulent classes of society in this country. We would not insult the munificent patrons of the art who so nobly contribute, from the treasures of their galleries, to form a collection of the works of ancient masters for the inspection and improvement, in matters of taste, of the British public, by supposing their minds

to be of such narrow compass, by imputing to them such extreme sensitiveness on the score of the merit of the paintings they send, as not to tolerate the utterance of a word of comment. We do not attach that importance to our own opinions on works of art, or to those of the most proficient connoisseurs among our contemporaries, as to imagine that a painting can be very materially affected in the eye of the public by any observations that may happen to be made on them, by way of criticism in periodical publications. But of this we are sure—an honest opinion can never do essential harm. Really good pictures will stand any test, and their possessors will never fear to submit them to the most rigid criticism. As to those of doubtful merit, a picture-dealer, a mere trafficker, might indeed well deprecate animadversion, but a gentleman would court it; for the latter, however he may have been himself the victim of art, is above the desire of deceiving others. If an honourable man receive a bad coin, does he mix it up with good pieces, that he may get rid of it at the expense of his neighbour? Besides, who scruples to make the freest animadversions on works of living artists, whose very bread depends on the estimation in which their performances are held by the public; yet we are to gaze in silence at the annual display of ancient paintings lest one mere word should deprive a Cæsus of a guinea, should he ever take it into his head to change the object of his caprice. The abstaining from commenting on the collection of ancient masters at the British Gallery does indeed seem to us a most absurd affectation of delicacy.

We shall follow no such example, in full confidence that the freedom of our notices will find ample indulgence, if not on the score of their sincerity and moderation, at least from that liberal spirit from which all patronage of art must spring, and which alone can be the motive by which the owners of pictures are actuated in submitting the works they possess to public exhibition. Our second visit to the gallery was made in this spirit, and it was not long before an opportunity of exercising it was presented to us in the 'Holy Family,' by Sir Joshua Reynolds, the acquisition of which by the British Institution has been made the grounds of such extraordinary congratulation towards the public. We should be sorry for the reputation of Sir Joshua if it depended on this picture, which neither in its intellectual nor mechanical qualities does honour to that great master. The composition, it is true, is delightful, but the expression is meagre and affected. The 'Madonna' is a mere school-girl, entirely devoid of elevation of character, wholly unconscious of motherly sentiment, while the Joseph is an octogenarian with all the listlessness of decrepitude, of infirm senility. Surely this is not the true character of the holy family. The children are pretty. In point of execution, as respects colour, this painting is equally far from perfection. As a warning rather than a model it may indeed be of service, for in some parts of the picture the colour is quite gone.

The Murillos in the present collection are the greatest part of them tame, with one exception, the St. John with Angels, No. 24, the property of the Duke of Buccleugh, which is rich in expression and lively sentiment.

'The Both' of Mr. Hamlet we have already mentioned, but we cannot pass it a second time without noticing it. We could dwell on it for ever. It seems to us the perfection of pure natural landscape painting.

Titian's 'Loyola' we have unfortunately overlooked. We should regret having done so, but for the pleasure of having such a treat in reserve. It was gratification sufficient for one visit to have the attention called to the 'Venetian Senator,' No. 97, by that inimitable portrait painter. The 'Man's Portrait,' by Tintoretto, No. 121, on the opposite wall, is clever, expressive, and brilliant, but appears hard and stiff—its animation is the mere life of a picture, when compared with the truth, the intelligence, the animation, the regularity of feature, the strength of character, all combined with the utmost

simplicity of execution and absence of effort, which are observable in this master-piece of Titian's pencil.

'The Tribute Money,' No. 156, Rubens. Oibò. Who ever gave the name of Rubens to this performance? We ask the question boldly, in the conviction that by so doing we commit no trespass on Mr. Cholmondeley's property—that we are liable to no claim of damages—for we are confident this picture would never be exposed in a sale-room so catalogued, but that the auctioneer would be required to show title. The sketches by the same master, in the North room, the property of Mr. Baring, are splendid productions of genius.

No. 62, 'The Intercession of the Sabine Women between belligerent Husbands and Kinsfolk,' is most spirited.

ENGRAVINGS.

Pope Pius VII. Engraved by Cousins, from a Painting by Sir Thomas Lawrence.

OF all the royal and noble personages who figured during the wars and events immediately connected with the French revolution, and of whom the First Painter in Ordinary to his Majesty was commissioned to paint portraits, the Head of the Catholic Church was, perhaps, the very best subject for a painter. The situation of that pontiff, so long tried in the school of misfortune, his individual character, respectable equally in adverse and prosperous state, and which, without losing an atom of its originality, bore the marked impress of the circumstances of anxiety and vicissitude under which it had been matured; and still more the very marked development of that character in the physiognomy and person of the holy father, presented a theme such as a skilful artist delights to treat, and of which it was not likely that the present president of the Royal Academy should have neglected the advantages. Accordingly, the portrait of Pope Chiammonti ranks among the most happy productions of the first portrait painter of his day. It breathes the anxiety, the caution, the humility, the simplicity, the firmness, and resignation, which distinguished equally the character and countenance of that excellent old man, in a degree, perhaps, in which those qualities were never possessed by any former occupier of the chair of St. Peter. The engraving does ample justice to the painting—it is a *chef d'œuvre* in mezzotint. The sentiment of the original figure is faithfully preserved in all its shades, and, in respect to the drapery, the plate is a perfect specimen of execution.

William Kennedy, Esq. Author of 'Fitful Fancies,' Drawn on Stone by J. Franklin, from a Painting by J. Henderson, Glasgow.

We give the title of this plate in order that those who form galleries of portraits may know that there is a likeness of Mr. Kennedy in existence: at the same time, we must be allowed to express a hope that this is not a fair specimen of the state to which the arts either of painting or of drawing on stone, are carried in our fair town of Glasgow.—If it be, we recommend the gude folk to stick to their printing of cottons.

His Royal Highness the Duke of Clarence. Engraved by W. Hill, from a Drawing by A. Wivell. Sams. London, 1829.

Portraits of the heir presumptive to the throne are naturally in much request. We know not how the famous subscription medal goes on—that work may yet be in abeyance for aught we know; we may say, indeed, for aught we care, for interested as we are in works of art, the publishing the names of the officers who were willing to take a copy, was a proceeding so much like that of the celebrated publisher of the memoirs of a contemporary, to force people to buy his book in their own defence, that we have not been able to stifle a rising prejudice both against the artist and his performance. The subscription list on that occasion was long, and as the desired work is not yet forthcoming, those who are impatient to gratify their loyalty, may indulge it in the interim by procuring the print published by

Mr. Sams on a much more generous plan, and at his own risk.

The Catholics too, and the lovers of the peace and quiet of their country, no less than the sons of Neptune, have cause to be grateful to the manly and straightforward conduct of the Royal Sailor, and must be glad of the opportunity of having a memorial of their benefactor. The engraving is in the dotted manner, and is well executed.

London Characters, Designed and Etched by George Cruikshank. Robins. London, 1829.

QU'EST ce que c'est que la Physique? *What is Physics?* This amusing mistranslation struck our fancy perhaps more than the occasion warranted on opening, at a book stall, a little volume, the antique aspect of which had attracted our notice, and which we found entitled, 'A Short Treatise on Arts and Sciences, in French and English, by Question and Answer, by John Palairret,' (a name surely familiar to all who might confess to a seventh lustre,) Maitre François de L. A. R. Monseigneur le Prince Guillaume, Madame la Princesse Marie et Madame la Princesse Louise. 4th Edition, 1754.' The blunder, in days when a new edition consisted of a *bona fide* reprint, and not in a mere fresh impression after a few literal corrections of the press, might have been excused as a mere typographical error, but for the unfortunate *is*; *What is Physics*. As it was, it called to mind many amusing misinterpretations of foreign phrases and words, many of them generally known, some less notorious, and, among others, the waggery of a contemporary celebrated for the excellence of his jests and puns, who, on the strength of the word 'limon' in a report to the French Academy, astonished his readers with an account of human fossils preserved from antediluvian ages in lemon juice!!—a perversion unequalled unless it be by the error in a French translation of Sterne's celebrated *Apostrophe to Slavery*, the commencement of which is rendered 'Déguise-toi comme tu veux, tranquille esclavage.' But to return to M. Palairret, the answer 'Physick is properly the knowledge of bodies, &c.'—sufficiently explained his mistake—but curiosity led us to turn over a few pages and we again found the question, *What is Physick?* Referring to the French page, the corresponding interrogatory, *Qu'est ce que c'est que la médecine*, threw light on the object of this inquiry. In expectation of still more physick, we proceeded in our search, but received a balk on arriving at the query *What is Pharmacy?* Thrown out here, fresh game was offered us in *What is Metaphysics?*

But what have M. Palairret and his physick to do with *London Characters*?—Little, we confess, except to those to whom it may be pleasant to trace the associations by which things and thoughts the most opposite are linked. To such it will be no matter of surprise that *What is Metaphysics?* should call to mind the exquisite caricature—we envy not the austerity of that man's mind who would see it unmoved—'What is taxes, John?'

The transition was instantaneous from this humorous specimen to the *cahier*, which, under the title given at the head of our notice, has for some time lain on our table, holding us in doubt whether it would besem the dignity of a literary journal to condescend to notice caricatures. Our scruples are overcome; and if the name of George Cruikshank cannot excuse us to the most serious of our readers, we are confident that a glance at the 'Old Clothes Man,' and the 'Brewer's Drayman,' will. The old Hessians alone, trodden down and doubled between the heel of the natural man and that of the boot, and amply curling over the toes—to say nothing of the visage, oriental, sharp, and sallow—the worn silk hat of all shapes—and the old coat of dandy pea-green, low collared frock, with just two remaining buttons—are enough to acquit us.

SALE OF PICTURES BY MR. FORSTER.

We attended the private view of the collection of paintings about to be sold by auction in Pall Mall, by Mr. Edward Forster, but forbear noticing

the works particularly, because we would not act the part of picture brokers. Seeing a good copy, we should certainly praise it; and if a purchaser, concurring in our opinion, should afterwards discover that he had not acquired an original, he might take us to task for having a share in his mistake. On the other hand, as many good painters have produced bad pictures, we should be reluctant, by any ill-timed observations, to deter an amateur from availing himself of the opportunity of enriching his collection by a genuine work—pictures advertised for sale, therefore, we do consider privileged from comment, except from that sincerest of all critics, the auctioneer.

PICTURE OF THE HOLY FAMILY.

By special invitation we have paid a visit to Mr. Smith's rooms to see a painting of the Holy Family, by M. Kruseman, historical painter to the King of the Netherlands. This picture bears evident marks of the study of Raphael, from whom the artist has caught a considerable degree of grace. His composition is beautiful; but the work has an academical taint, and is not altogether the true thing. The hair of the heads is exquisitely painted—it is quite silken.

We received much higher gratification from a delicious Ruysdail, in the collection of Mr. Smith.

MELITA.

A FRAGMENT OF GREEK ROMANCE.

MELITA was a maiden of Elis, and no fairer spirit had ever haunted that peaceful land. Her beauty was known but to few; for her mother had been long since dead, and her father was the humble inhabitant of an obscure abode. She had neither brother nor sister; and had seldom been seen by any eyes but those of her aged parent. His well-ordered industry and serene affection surrounded her with a clear unchanging life; and she scarcely knew of any variation in the world but day and night, autumn and spring, the gradual whitening of her father's hairs and the growth and impulse of her own feelings. As she approached to womanhood, her thoughts began to overleap the low and grassy mound with which the narrow plat of her existence had previously been encircled, and on which, even from her infancy, many bright phantoms had appeared to her to stand in the morning sunshine. Her wishes now attempted to follow the unknown flight of those gay shadows; and she longed to resemble them in rising with the lightness of a bird over the boundary which divided her from the busy and glittering world.

When Melita had reached her fifteenth year, the time came round for the celebration of the Olympic games. She heard from her father some short and broken accounts of the splendid festivals at which he had frequently been present; and she was lost in bewildering excitement while she fancied a succession of pageants led by glorious beings of whose forms she was utterly ignorant. But above all, she was possessed by the resemblance which she had wrought in her imagination of the deity to whose honour these rites and contests had been instituted.

In the morning of the first day of the games, she almost unconsciously expressed, in her father's presence, the earnest longing which she felt to behold the bodily presence of the great Jupiter. The old man started out of the usual tranquillity of his manner, and said to her, 'Unhappy, my daughter, is the mortal to whom such a vision shows itself; he who has conversed with a god is for ever unfitted to lead the life of earthly men. To eyes which long for the sight of superior natures, their desire is sometimes granted; but that for which they yearned is always fruitful of horror and destruction. I could tell you a prediction which your mother heard from the oracle; but He said no more, for the time had approached at which the solemnities were to begin; and he hastily left the house.

This conversation did not diminish the store of uneasy mystery which filled the mind of Melita.

All day she brooded over the thoughts which had occupied her; and when her father returned in the evening, she was restless, eager, and confused. The dusk had come before his entry; and he had scarcely been able to speak to her when a slight knock was heard, followed, as it seemed to them, by a faint groan. The old man turned the door on its sleepy hinges, and found lying on the earth a young man, who was evidently broken down by some malady. He lifted up the youth, and carried him into the house. The stranger was clothed in a remarkable dress, and appeared not more than eighteen. He was revived by the care of Melita and her father, but still continued feeble and suffering. They learned from his low and interrupted words, that he had come from one of the farthest Grecian islands, with the design of contending at the games for the prize of poetry. But he seemed almost delirious, and he told no connected tale. He remained for several hours pained in body and wandering in mind. Among other hints and ravings, he spoke some scattered phrases as to the magnificence and interest of the festivity which he had on that day, for the first time seen. He then was seized by the recollection of the ode which he had intended to recite on one of the subsequent days. The stanzas, which at intervals he murmured, were full of fervour, of religious awe, and splendid images; and belonged to a lyrical description of the intercourse of Jupiter with mortal maidens; some of the fragments were so passionate and impressive, and Melita listened with an interest so full of wonder and rapt excitement, that her father commanded her to retire, and to leave the patient under his care.

She lay awake for several hours; and fell, at last, asleep, with a brain and bosom possessed by tumultuous and gorgeous visions. Early in the morning, her father announced to her that the youth had, in the night, become much calmer, and that he had left him to obtain himself some short repose. When she had arisen, the boy was no longer to be found; but he had left behind him his rich and remarkable dress, and had only taken away an old mantle, which, while he lay on the couch, had been thrown over him by his host. Her father added, that he was now about to join the crowd at the games, and that he should not return till late in the evening. She placed herself in the room in which the youth had lain, and employed herself in putting together all she could remember of his strange and imperfect phrases, and in connecting them with the wishes and fantastic images which had filled her mind before. Near to her lay the garments which he had worn; Melita fixed her eyes on them, and she felt as if some unseen enchantment prevented her from looking away, even for a moment. As the day closed in, the evening wind arose, and brought to her ears the distant applauses of the Grecian people gathered at their chief solemnity. She gazed and nuzzed, and after a struggle of fear, shame, curiosity, and vague wishfulness, she could no longer resist the temptation; she hastily put on the dress of the poet and left the house.

Her impetuous and winged feet bore her she knew not whither. In a short time, she had moved a considerable distance, when she beheld near her a procession of worshippers, headed by the priests, and accompanied by many attendants. She joined their ranks, and was surprised to see that the youths in the service of the gods were clothed exactly like herself, so as to secure that she would pass without notice. The train advanced to the sacred grove which surrounded the Olympian temple; and here she beheld, with delight and astonishment, the long files of statues which exhibited the conquerors at the games, with the emblems of the exercises in which they had respectively triumphed. The evening light flowed beautifully through the interstices of the dark foliage, and fell with a soft illumination on the still and white heroic figures. The throng moved on; and while the greater number placed themselves before the lofty and shadowy portico of the temple, a few of the priests

and of their attendant boys entered the building. Among these Melita ventured to glide, and, from the instant which gave her a glimpse of the god, she was insensible to all else.

She sank on the marble pavement in the shade of the gigantic deity, and watched his form as intently as the astrologer watches the star on which depends his entire destiny. The twilight was broken by the thin flames of a few distant censers; and it seemed to her that she distinguished the limbs and features of the statue rather by some radiance of their own than by any outward beam. The calm and mighty face was more beautiful than all she had imagined; the brow was girded with olive, and appeared a bright throne for heavenly supremacy; the deep eyes were filled with a solemn and a lovely spirit; and she felt that she would rejoice to breathe away her soul upon that mouth, so awful and yet so sweet. The gleam of dusky gold on the garments in which Jupiter was clad, gave the semblance of a faint and floating glory; but all that was in the temple of distinguishable light gathered itself on the celestial countenance, and kept it, even when night had almost closed without, a visible revelation of the greatest god.

(To be continued.)

VARIETIES.

DELAY OF PAGANINI'S DEPARTURE FROM BERLIN.—The excellent reception and ample receipts which rewarded the performances of Paganini at Berlin, induced him to postpone his design of proceeding to England, and to prolong his sojourn in the Prussian capital. On his fifth concert his exertion appeared more wonderful than ever; and it is remarked, that the oftener he is seen, and the more his performances are reflected on, the more inconceivable do they appear. A distinguished connoisseur remarked of him, "Where our performance ends, Paganini's begins!"

At the concerts above mentioned he gave a new surprise to his auditors, in addition to the magical effects by which he had before caused such astonishment, by accompanying a song by a young lady, Mad. Von Schätzel, whose voice he imitated in a most perfect and masterly manner. The voice of the demoiselle is spoken of as one of those purely bell-like organs which alone could venture to engage in such dubious contest with the violin.

The receipts of the fifth concert were half for the benefit of the poor; the theatre was full, and the applause and enthusiasm of the public as great as if it had been the first appearance of this wonderful performance.

UNIVERSITY OF HALLE.—The number of students in the University of Halle, in the half-year between Michaelmas 1827, and Easter 1828, amounted in the whole to 1185; in the half-year from Easter to Michaelmas 1828, the numbers were in the whole, 1316. In the last half-year the number amounted to 1330, of whom 944 were students of divinity, 239 of law, 58 of medicine, and 89 of philosophy, philology, mathematics, &c. The foreigners were 355, the Wurtemburgers 975. Those who have already passed their examination and taken their degrees, although continuing to profit by the instruction given in the university, are included in this statement. A new building for the university is about to be erected on the site of the present theatre, formerly the church of the garrison and university, and the Lutheran gymnasium; 40,000 dollars were ordered by the king to be assigned for the purpose in 1827. The designs are now in a state of forwardness.

PIRKHEIMER THE PRINTER.—Wilbald Pirkheimer, who flourished at the beginning of the 16th century, contributed materially to the encouragement of the sciences and arts in Nuremberg: it was he who gave printing in that town its first and grand impulse. He was a great promoter of classical literature, by quickly importing into Germany whatever had been discovered in Italy; and from his twelve presses pro-

ceeded the works which awakened in Germany the spirit to encourage the soarings of the human mind, then newly aroused from a long and profound lethargy. He was the most trusty faithful friend of Albrecht Durer, and was altogether a great friend to art, and the fosterer of good taste.

NEW THEATRICAL WONDER AT VIENNA.—The impatience of the good citizens of Vienna, in February last, while anxiously waiting the arrival of Pasta, whose renown in London, Paris, and Milan had long preceded her, was happily beguiled in a slight degree by the appearance on the boards of their opera of a dilettante songstress, Mademoiselle Hähmel, whose name has been re-echoed through the private circles of the Austrian capital for these two years past, as one of the first musicians of the day. This young lady made her début as Rosina, in the *Barbiere di Siviglia*; and unless the German critics have allowed their partiality or their indulgence for their young country-woman to get the better of their judgment or their integrity, she approved herself an artist of no ordinary quality. Her execution astonished, even to raptures, a numerous audience, whose expectations had been raised to a very high pitch, and convinced the public that the eminent qualities which had gained for this young lady such reputation in private circles, were equally qualified to make a figure on the boards of a theatre. The public were surprised to find in this clever dilettante not only an accomplished singer of the best school, (the never-to-be-forgotten Salieri was her master, says our critic.) but an actress also of the highest school, that of genius and natural grace. Pastas and Malibrans are yet rare, and we therefore trust this account of Mademoiselle Hähmel proceeds from no dream of enthusiasm or gallantry on the part of our Austrian critic.

THE MINER'S BRIDE.

(Continued from p. 383.)

Sixty years after the sudden disappearance of Pierre, Margaret had closed the eyes of her benefactors: nearly all those who were to have rejoiced at her wedding had left the earth. The children who had frolicked in the bridal train had become adults—many of them old men. A new generation had sprung up; and the remembrance of the singular occurrence existed only as one of those traditions which, handed down from one age to another, are exaggerated by the reflections and dreamings which superstition suggests to the uninformed mind. The country people spoke of Pierre as of a supernatural being: they accused him, at least, of having leagued himself with evil spirits. In the cold season, when the wind drifted the hoarfrost on the ground, and made the severing branches of the elms and the beeches crash, or when pouring into the chimneys it resembled a long and dolorous moaning, the good old gossips fancied it was Pierre come to request their prayers and a last asylum. They recognized his voice, they said, in the clannour of the storm, when the snow had ceased to veil the smiling aspect of the meadows, and the sun was ripening the corn and the grapes upon the hill. In intense heats, when a light vapour was inflamed above the horizon, they imagined it was a star which danced about, and typified the torments of Pierre's soul. The screeching of the bird of night, the rustling of the trees, the motion of the snake in the thick grass, the distant howlings of the wolves,—every thing struck terror into the hearts of the villagers, when they had to quit their dwellings. The men, in consequence of these sinister beliefs, laid a stronger grasp on their hatchets, and brandished them in silence, with an affected smile, but casting uneasy looks round about them. Mothers drew their children closer to them, as though they thought the cold hand of Pierre might be hovering above them, and menacing the safety of their innocent charge. Pierre was the scape-goat. Prayers were offered to him, and wax tapers burnt in his honour. The terrified imaginations of the villagers made them consider as always occupied to their hurt the shade of him who, during his short career, had

only thought of doing good to his fellow-creatures! —At length, after many labours, after every shaft of the mine had been exhausted, and every previously indicated direction explored, it became necessary to open fresh caverns. The owner came to the scene of action, and his arrival was the signal of festivity. He was humane, and was adored by the miners. He assembled them to bore in the spots fixed upon by the men of science whom he had brought with him. Plans were laid, lines were traced, new routes were pointed out; and very soon the heavy sound of the pick-axe, as it resounded on the blocks of granite, the strokes of the mattock, and the wheeling of barrows announced the renewal of labour.

For four days things had flowed on in their usual channel: the company of the owner having greatly diminished. The young ladies with the young cavaliers who had come to assist at the miner's feast on the opening of the works, who had danced beneath the embowering trees, had returned to town. None remained but immediate friends and the men of science. Their calculations were without ceasing; for it was their object, while augmenting the fortune of the owner, to ensure the subsistence of the workmen.

Suddenly there was heard an unusual noise. It was a heavy murmur like the growling of a distant tempest. It increased. There were cries and sounds of lamentation. The ground trembled. The owner was speedily at the mouth of the mine. The alarm was rung with violence: every pulley was in motion. He descended in the bucket to the succour of his men, whom he thought exposed to inevitable death. All were got up: the miners escaped, pale, trembling, and the sweat running down their cheeks. 'What is it?' said the owner. 'A man!' 'Hell!' 'Death!' 'A miracle!' 'An apparition?' Such were the exclamations from their lips which terror had made cold and contracted in a frightful manner. Very soon, however, the owner succeeded in collecting from the scattered words dictated by fear something like an intelligible phrase.

While endeavouring to open a communication between the new mine and the old ones, the workmen had discovered a layer softer than any before it. Stones and earth alone composed the thick mass, and strange substances, which they met with in great abundance, seemed to prove that, in times long past, an immense falling in had suddenly occurred in this place. It was easily worked; and large masses yielded to a single stroke of the pick-axe. When they had advanced a few feet, on a sudden, a very considerable heap being deprived of its support, fell asunder: thin currents of gas rushed from the midst, and caught fire; and what was the consternation of the workmen, when, by the light of this flame, they saw a young man fall down, apparently asleep, on the newly constructed bed. His brow was serene; his cheeks fresh, nay ruddy; but his mouth and his eyes were motionless. Instead of approaching to examine his features, and afford him assistance—for perchance he had need of help—the miners fled with the greatest precipitation from this sudden apparition. Fear, in the short distance they had to run to join their fellows, already influenced their tongues. It was no man. It was an infernal spirit, which had appeared to them amid lightnings and thunder. It was the mysterious power which haunted the mines, and so frequently disturbed the works. His form was gigantic. They saw him rouse himself, rise up, and stretch forth his arm like a pillar. He must be striding along the caverns, and burning the props of the new shafts, and burying every thing in ruin.

The proprietor listened attentively to these magnified details: and his countenance became calm. He cast a look about him. All the miners had come out of the mine, every eye was fixed upon him, and all, with looks of terror, seemed to wait his decision, and expect him to give the signal for action. 'To the mine!' he exclaimed, after having spoken in a lower voice to the friends and

scientific men who surrounded him: and he led the way.

In a short time they discovered the truth, and the broad day illustrated this wonderful phenomenon. They laid upon the grass near the mouth of the pit the cold and humid body of a young man. His garments belonged to a bygone age, and had been made in a bygone fashion. The manner in which they were adorned, bespoke the festive occasion for which they had been put on. Near him was found a box, which they opened; it contained some jewels, a cross of gold, a chain, a medallion engraven with a cypher, but the date was effaced. They were trinkets intended, probably, as a love-token for an adored mistress.

The whole village was assembled; and, while the savans were investigating, and the authorities lost in conjecture, every inhabitant was seeking, in his reminiscences, for a clue to the truth; but all in vain!

'Margaret!' cried a young female, in a voice indicative of astonishment, at the sight of a very aged woman who was slowly advancing toward the large circle who were anxiously waiting for an explanation of the mystery. 'Make way for a guest,' cried several voices, and the old woman was not far from the group formed by the proprietor and the authorities. She paid no attention to the surrounding crowd, and scarcely thanked those who opened her a passage. Her visage, usually pale, was very much flushed; her eyes sparkled: and it was evident that something more than ordinary was passing within her. Suddenly, with a wild and convulsive movement, she pushed aside the proprietor who stood before her. She fell down and kneeled by the side of the corpse. Without a moment's hesitation she exclaimed, 'Pierre!' and her feeble hands shrivelled with age and disappointments, were traversing the face of death. She put aside the damp hair, and printed a kiss on the brow of that fair form which had for sixty years been buried in the earth, and which owed to its untimely sepulchre that appearance of youthfulness for which age would have substituted its grey hairs and its wrinkles. 'It is Pierre!' she repeated; it is the companion of my infancy! it is my betrothed! and tears, which seemed to spring by turns from joy and from grief, coursed down the furrows of her cheeks—'I waited for thee! Oh! I did not die without seeing thee, without once more embracing my beloved!'

They endeavoured to remove her from the horrible spectacle on which she gazed with a joy that exhausted her strength and was killing her. But in vain; she clung to the body of Pierre, she strained it in her feeble arms, and vowed that she would die upon the heart she could not reanimate and which had beat only for her.

Then was the whole mystery explained.

Poor Pierre! He had intended to surprise his bride, and had evidently concealed the presents which were for her, near the place of his accustomed labours. How dreadful his brief essay must have been! His thoughts reverting to the sports which were celebrating so near him, by the side of his uneasy friends, his father and his mother; and he should never see them more! And his last groan could not be heard, and he was stifled, in the fulness of strength and of life, beneath the weight of a whole mountain!

Well had Margaret said, 'Pierre, I will wait for thy return!' for she survived not the violent emotions it produced; she expired with his loved name upon her lips. Little did she once imagine that the coffin would be her bridal bed; or that he, with whom she had hoped to reap the full harvest of maternal endearment through a long course of years, would be snatched from her as he was, only to be restored to her after a long and lonely and expectant life—that a marriage might be consummated, of which death was the priest, and performed the rites with a grin of blasting derision at the hopes of youthful love.

THE INVENTION OF GUNPOWDER.—Professor Scheliber has pronounced the dispute between Furburg, Cologne, and Eular, as to the invention of powder and its application to the art of war, in favour of Furburg, on the strength of a manuscript of 1432, communicated to him by the learned Hug. In this document it is mentioned that one Niger Bircholdus (Berchtold Schevartz) having employed sulphur, saltpetre, lead, and oil to obtain a golden colour, the composition had more than once made the vessels containing it jump, and that, by this means, he arrived at the invention of gunpowder. Stephen Forcatulus, who died in 1574, at Touloun, refers the discovery to Fribourg, but attributes it to one Constantine Anklitz. M. Schniber thinks that the two reported inventors are one, and reconciles the apparent contradiction by supposing that Constantine may have been the *nom de religion* of Berchtold, and as one of the order of Frères-Ūrigneurs, among whom the discovery in question is known to have been made, while on the world he would still be recognized by his patronymic; and he gets rid of the addition of Schwartz, the meaning of which is *black*, by considering it as simply indicative of the colour of Berchtold's religious habit. M. Schniber allows that these are mere conjectures.

ANTE-DILUVIAN ARCHITECTURE.—A work on the ancient ruins, called the Tower of the Giants, in the Isle of Gozzo, near Malta, has been lately published at Paris. The author is a M. Mezzara, a painter, and his work consists of eleven plates, from drawings on stone, after his own designs, and contains an account of what is called the *discovery* of the ruins of that ancient temple. This same giant's tower is conjectured by M. Mezzara, who examined it in 1827, to have been built before the deluge. Of the eleven plates, the first is a view of Gozzo from Malta; the next nine following are general and particular views of the temple in question; and the 11th represents what is called the Grotto of Calypso; since it is pretended that Gozzo is the island of Calypso of Homer. According to M. Mezzara's account, the external walls are constructed of shapeless masses of rock heaped one upon another, and the internal partitions of hewn stone irregularly ranged. It appears that the ruins form two distinct monuments of rather unequal size; the axis of the less inclines towards the greater, which suggests the probability that there may have been a third. The figure of the two existing temples is that of a double cross, the immense branches of which are rounded at their extremities, forming thus, as it were, four lateral chapels. The interior contains a few sculptured ornaments, among them a serpent. From the view of the extreme into the smaller temple, it would seem that the building was reared in the midst of rocks naturally disposed in layers, and parted into parallelopipedons. These oblong blocks are raised on end like the supports of druidical dolmens. M. Mezzara has not confined his speculations to the era of these immense and interesting ruins, but has ventured on the ridiculous suggestion that, (even in the time of Pliny,) Gozzo, Malta, and Camino, were united,—an inference which he, too, humbly draws from the fact, that the *fringus Melitensis* of Pliny is the produce of a rock off the Isle of Gozzo. If M. Mezzara be no better artist than reasoner, his work is not worth much, although it treats on a very interesting subject. There is no doubt, however, that the ruins are of very high antiquity; but for claiming to M. Mezzara the merit of discovering them in 1827, there is no pretence whatever. The name of Torre de Giganti given to them by the inhabitants of their little island, is a sufficient proof of this. They have been long well known also to the residents at Malta, and we ourselves saw them in 1823, and then indulged in the reflection that we had been favoured with the sight of the ruins of a Phœnician building. We believe it to be true, indeed, that they have never before been published in such detail as they are now given in the work of Mezzara, which, if accurate, must be highly interesting. We have not seen it: and any knowledge we possess of it is derived from the Bulletin Universel.

MAHOMETAN BENEFICENCE.—On the road between Sardis, the ancient capital of Lydia, and the chain of mountains known by the name of Yousouff-Dagh, extending from Mount Olympus to Mount Ida, there are fountains at certain distances, erected by individual benefactors, whose names are to be read on the stone, generally in conjunction with a verse of the Koran. On one of these is inserted the following sentiment:—‘That man is the most perfect who is the most serviceable to his fellow-mortals’.

BOOKS PUBLISHED DURING THE WEEK.

The Adventures of a King's Page, 3 vols. post 8vo. 11. 11s. 6d.
Memoirs of Lady Fanshawe, 1 vol. 8vo., 14s.

On the 1st of June was published, price only 2s. 6d., Part VII. of

THE EXTRACTOR; or, Universal Repertorium of Literature, Science, and the Arts. The present Part contains—Travels in Arabia—Effects of Galvanism on the Animal Structure—Songs of Burns—Temple of Ypsamboul—The new Colony on the Swan River—Coast Lights on a new principle—The two Emiles—Exemption of Operative Tanners from pulmonary consumption—Rice Paper—Wilkie the Painter—Mr. R.—d's Dream—The Court of Napoleon—Description of Jerusalem—The Cause of Dry Rot Explained—Recollections of a Night Fever—Convent of St. Bernard—The Emperor of Austria—Transplantation of Grown Timber Trees in Phenology—Steam Navigation—Beet Root Sugar—Gastronomy—Ticks in Animals—Opium—Dr. Chalmers—The Baron of Arnheim—The Waverley Novels—English Paper—Rules for Connoisseurship in Painting—French Criminal Trials—Captain Owen's Plan for Bating Chronometers—Visit to the American President, Jackson—Mountain Storms and Slides in America—Origin, Nature, and Number of Sutees—Poisonous Effects of Fresh Water on some Marine Animals—The Editor in his Slippers—The First and Last Kiss—Modern Jewish Customs—Principles of Teaching—Public Records—The Proverbs of Solomon—Three Years at Cambridge—Wits and Authors—Cavalry Tactics—Dogs—Remember Me—Varieties, &c. &c.

Published at ‘The Extractor’ Office, 186, Fleet-street, and may be had of all Booksellers.

NATIONAL REPOSITORY, Gallery of the Royal Mews, Charing-Cross. Patron—The KING. The EXHIBITION is NOW OPEN daily.—Admittance, 1s.; Catalogues, 1s.

T. S. TULL, Secretary.

EXHIBITION OF DRAWINGS, by J. M. W. Turner, Esq., R.A., consisting of VIEWS in ENGLAND and WALES, executed for a Work now in course of Publication, at the Large Gallery, Egyptian Hall, Piccadilly.

Admittance, by Tickets only, which may be obtained (gratis) of the publisher, Mr. Jennings, 2, Poultry, and 325, Oxford-street. Open from Ten till Six.

Subscriber's names received at the Gallery.

SCULPTURE.

TAM O'SHANTER and SOUTER* JOHNNY.—These Statues, illustrative of Scottish Character, Costume, and the Poetry of Burns—Scotland's Immortal Bard—executed by the self-taught Artist, Mr. THOM, are now exhibiting at 28, Old Bond-street. Since their arrival in Town, (23d April,) they have been visited by upwards of 10,000 persons, all of whom have expressed their admiration of them as works of art.—Admission, 1s.; Books with Observations, 6d.

* Cobler.

APOLLONICON, a Grand Musical Instrument, under the immediate patronage of his Majesty, invented and constructed by FLIGHT and ROBERTSON, Organ Builders, is now OPEN to EXHIBITION daily, from One to Four, performing, by its self-acting powers, Mozart's Overture to ‘Idomeneus,’ and Weber's celebrated Overture to ‘Oberon,’ which it executes with a grandeur and brilliancy of effect superior to any instrument in Europe, at the Rooms, 101, St. Martin's-lane.—Admittance, 1s.

M. R. ELLA'S CONCERT, this evening, (Wednesday,) at Mrs. Henshaw's, No. 26, Wimpole-street, will commence at nine o'clock. Mademoiselle Sontag and Madame Malibran Garcia will sing the Duo from ‘Semiramide,’ ‘Ebbes a te ferisci.’ Madame Camporese will sing in a Trio of Mozart, &c., &c. Mademoiselle Blais will sing the ‘Grand Scena’ from Rossini's Opera of ‘Moïse,’ as written originally for Mademoiselle Cinti, and esteemed one of his best productions. Several Concerted Pieces, Vocal and Instrumental, will be executed for the first time in England.

Principal Vocalists—Mademoiselle Sontag, Madame Camporese, Mademoiselle Blais, Miss Child, and Madame Malibran Garcia; Signori Curioni, Donzelli, Zucchielli, Begret, Galli, Segura, Supis, Bruni, and De Bagnis.

Messrs. De Beriot, Labarre, Nicholson, and Pami, will each play a Solo. Mr. Ella will write Accompaniments to the Vocal Music for a petite Orchestre, composed of the following eminent Performers—Messrs. Oury, Moralt, Guynemer, Lindley, Dragonetti, Nicholson, Monzani, Ella, and Fella.

Tickets to be had of Mr. Ella, 45, Warwick-street, Golden-square.

IMPROVED TERRO-METALLIC TEETH.

M. R. HOWARD, 52, Fleet-street, (removed from 33,) having brought to perfection an important improvement in TERRO-METALLIC TEETH, respectfully solicits the attention of the Nobility and Gentry to his new method, which he is confident will be found on investigation to be far superior in natural appearance and durability to any ever before produced in England. They perfectly restore the articulation and mastication, and are not to be distinguished in any respect from the original teeth.—52, Fleet-street. At home from 10 till 4.

TERRO-METALLIC TEETH.

M. R. A. JONES, Surgeon-Dentist, 43, New Bond-street, begs to acquaint the Nobility and Gentry, that, from many years' intense application, he has invented and brought to perfection, a New System of Fixing TERRO-METALLIC, NATURAL, and ARTIFICIAL TEETH, from one to a complete Set, which are so accurately fitted as not to be distinguished from the original, and answer all the purposes of mastication, articulation, &c.—Mr. A. J. continues stopping decayed teeth with his unrivalled Anodyne Cement, which in one minute allays the most excruciating pain; and by this means carious teeth are wholly preserved and rendered useful, even if broken close to the gums. This being a metallic composition, it becomes hard as enamel in a few minutes, will not decompose with the heat of the stomach, and resists the effects of acids, atmospheric air, &c.—Cleaning, and every operation incidental to Dental Surgery.—At home from ten till five.

London: Printed and Published every Wednesday Morning, by WILLIAM LEWER, at the Office, No. 4, Wellington-street, Strand.

AND

LITERARY CHRONICLE.

No. 88.

LONDON, WEDNESDAY, JULY 1, 1829.

Price 8d.

AN HOUR AT A PUBLISHER'S.

MR. COLOPHON, as the public are aware, is one of the most eminent of London booksellers. He is overwhelmed with business; and gaining £10,000 a-year, he cannot afford to keep half an hour a day to himself. I was desired to call on him by my uncle, the vicar, who wished to publish a tract against popery, and as he knew that the Dukes of Cumberland and Richmond were of his opinion, thought that it might be proper to employ a fashionable bookseller. I sallied, therefore, from Lincoln's-Inn, with a part of the MS. (which I confess I had not read,) in my pocket; and made my way to the residence of Mr. Colophon. I was desired by the gentleman in the shop to wait in a small room towards the rear of the premises, where I had not remained above three-quarters of an hour before the great publisher appeared. I was rejoicing at the hope of seeing my business ended; when the door was opened, and the gentleman from the shop entered, and said, Lady Amelia Aubrey was getting out of her carriage at the door. 'Good heavens!' exclaimed the publisher, 'the Baroness Bellevue is up stairs, correcting the proof-sheets of her new work; she cannot take them home, for fear her husband should discover her. Mr.—a—a, I beg your pardon. Good heavens! Lady Amelia is at the door, and you cannot go without meeting her. She would die at being seen by any of my best-patrons, quizes, as she calls them. My dear sir, I must intreat you to let me hide you in this book-case.'

So saying, Mr. Colophon opened the green silk door of the book-case, (which did not contain shelves, much less books,) and while I stepped into my cell, he assured me, that the moment he could find an opportunity to speak to me, he would let me out. He had scarcely time to turn the key before Lady Amelia entered.

'Well, Mr. Colophon,' she said, 'I hope you have made up your mind to give me the other two hundred for the MS.'

'Really,' answered the publisher, 'your ladyship must consider how many works I have had lately of the same kind.'

'Yes, sir,' she replied, 'but you must consider how few of the novels of fashionable life have been written by any one but cast-off secretaries, chaplains, apothecaries, ladies' maids, lawyers, and so forth.'

'I am sorry,' lisped the biblioplist, 'to be obliged to remind your ladyship that this kind of article, as one of the gentlemen employed in my periodical observes, is like the goods used in traffic with savages. Excellence of workmanship is scarcely any object. The panegyrics in the newspapers, (which some people are so malignant as to pretend that I pay for,) and the taste of the readers of circulating libraries, level all differences of merit.'

'Then, Mr. Colophon,' said the lady, 'I am quite convinced that the name of any person of fashion connected with the authorship of a book very much helps the sale. The lady mayoress, and I suppose she is a fair sample of the whole herd of vulgarians, said, the other day, to the Baroness Bellevue, about her first work, that she had read it, and admired it vastly, on account of its having been written by a peeress. "For," added the absurd woman, "I read and admire every thing that is written by persons of rank and fashion. I detest plebeian literature." You can put that in one of your puffs, can you not? It will mystify the city people.'

'O! undoubtedly,' ejaculated Mr. Colophon, 'your ladyship's name will be of great service. As soon as the work is published, I will persuade my friend of the Morning Chronicle to attack the ladies of the aristocracy, for being so profligate as to write novels instead of codes of criminal law, and will make him add, in a note, as a piece of secret intelligence, that your ladyship is a flagrant delinquent.'

'O! you may say any thing you please about us in the Chronicle. If it were to attribute the book to Sontag or the Duchess of St. Albans, the report would not be contradicted, for nobody would ever see it. But to business, Mr. Colophon; I really must beg that you will add £200 to the £1000 we agreed on. I want the money; and I have spent almost as much in scent to keep me from fainting with the fatigue of authorship, and rose water to wash the ink from my fingers.'

'Your ladyship,' he replied, 'distresses me unutterably. But we really have had so many of these works and by persons of real fashion to.'

'Can you pretend, sir,' exclaimed the lady, with a burst of the loftiest indignation, 'that any one, in a good set, has told so many secrets of her friends as I have in the novel which you want to buy so cheaply.'

'There I allow,' said the publisher, 'from what my literary friends inform me, that the work has extraordinary merit. Perhaps,' he continued, 'the matter might be arranged. There is a chapter, which I am told is rather long and heavy, giving an account of a debate in the House of Commons. Now, if your ladyship would substitute for that the secret history of this elopement, with which the papers are now filled, I can say that the £200 should be £300.'

'Certainly,' she answered musing, 'that chapter is tedious; I own I intended it to be so, and therefore I took all the arguments on both sides of the question out of the MS. of a speech which Mr. Aubrey intended to deliver last session. I designed this part of the book to be rather sleepy, that the account of the intrigue between the hero and his cousin might have the more effect. That description is a little warm, and as I wished it to produce its full impression, I made the preceding pages a contrast to it. As you say, I might insert the true state of the game which the public, in their ignorance, have been betting on so absurdly. I was the lady's only confidante; and I need colour but a very little to make it a very interesting chapter. But how will it come into my story? Let me see; yes, I have it. I will make my hero elope with the one woman as a blind for his views on the other. Then he shall leave her at Calais, and return to London to complete his triumph with the heroine. An excellent thought of yours, Mr. Colophon; but could you not say £350 in addition to the £1000. You know I may be abused for divulging the confidence of my foolish friend, who has spoiled her game so completely by this stupidity. You shake your head; well, I suppose I must agree to your terms; and at all events, I have not time to stay any longer, for I have promised to take a stall at a charitable bazaar.'

Lady Amelia Aubrey had not been gone an instant before the gentleman from the shop entered the room, and announced in a low diplomatic tone that Mr. William Winchester Wandrille had called, and desired to see Mr. Colophon; and thereupon Mr. William Winchester Wandrille made his appearance. I could perceive through a slit in the

silk curtain that this gentleman was a person of great importance. He was very carefully dressed, and he carried himself with an air which seemed to assert his superiority over common authors, and all such vulgar people. He threw himself into a chair, and indicated to Mr. Colophon, by a motion of the hand, that he might be seated.

'I perceive,' said the man of fashion, 'that you have examined the volume of amatory poems I sent you; pray what price may I expect for the copy-right. There are not many of them; I shall be satisfied with £500 for the first edition.' The bookseller's jaw fell, and his eyes grew round and staring. '£500! Eh, Mr. Wandrille? £500 did you say for the first edition! Upon my word, Mr. Wandrille—I beg your pardon, sir—but upon my word I had rather intended —' 'What, sir,' interrupted Mr. Wandrille, 'you had intended to offer me less for poems that have been admired by half the finest women in London. I beg I may hear no more on the subject. I shall expect to receive the draft for the £500 before six this evening.' And so saying, Mr. Wandrille was about to depart, when Mr. Colophon, with a look and accent of despair threw himself in his way and exclaimed, 'Only listen to me, sir, I entreat you, for one minute. Poetry really finds no sale at present; no sale whatsoever; and as to love poems, most especially, I could not promise myself to dispose of a hundred copies. Then, then, sir, you must consider that in this case I should have to employ a person to correct the casual slips of the pen and errors of grammar, of which there are a good many in the manuscript; and to substitute other lines for those which have crept in from Moore and Byron. All this would cost money; so that on the whole I fear I must decline the undertaking.'

Mr. Wandrille for a moment appeared to be discomposed; and muttered something about having promised Lady Cecilia that he would publish his poems, and having given the long odds at his club that he would be in print before the day of the Derby.

Mr. Colophon again spoke, and said that he had something to suggest which might perhaps meet Mr. Wandrille's views. He offered to print the poems at Mr. Wandrille's expense, and added that a small edition would not cost above £150.

The author considered for a few moments and said, 'Do it for £100 and I agree. But see that you do not let it be known the book has cost me any thing, or I shall be quizzed to death.' Mr. Wandrille then departed, and endeavoured, as he left the room, to assume something of that bold supremacy of look which he had displayed at his entry.

Mr. Colophon accompanied his distinguished visitor to the outer door, and I hoped that I should be immediately released from my prison; but I could not account for the strange jostling and the unintelligible clamour which accompanied the return of the bookseller. These noises were soon explained by the appearance of the unfortunate Colophon between an Irishman and a Scotchman, who had been waiting to pounce on him. They both spoke together, and for some time I could not distinguish any thing they said. At last the publisher exclaimed aloud, 'Gentlemen, if both of you speak at once, it must be impossible for me to listen to either.' This added new fuel to the blaze of their eloquence, and each roared louder than before, in hopes of being first attended to. The Scotchman, however, who

was the elder of the two, soon gave up the contest, and the Irishman began to state his business, pre-facing it with an assertion that the other was very ungentlemanly for interrupting him, to which the Scotchman replied by muttering that it would be unworthy of a philosopher to mind hard words.

The Irishman was a youth upwards of six feet high, with a broad indistinctness of feature, which was scarcely marked by any characteristics but an enormous mouth and squinting eyes. 'My name is O'Rourke, and I have come from Ireland,' said the stripling, 'with a tragedy in my pocket; and I have been living here for three months, in hopes of having my play acted. But the managers of the theatres are very ungentlemanly; and so at last I have brought my work to you Mr. Colophon,' (therewith he produced from his pocket a club-like roll of paper), 'to request that you will publish it, and give me 200*l.* for it. It is very little to ask (for I am told that there have been above fifty editions of Shakspeare), but I want the money immediately, for I found the living in London and frequenting the theatres very expensive, and I owe about 150*l.* Therefore, if you will just settle my business and let me go, I will lave you and this jantleman to arrange your affairs together. I have no objection to take the money either in notes or sovereigns, just as may be most convanient: I am not particular.'

'Really, sir,' said the bookseller, 'this is a most extraordinary application. My time is of importance; and, therefore, I may as well state to you at once, that I would not publish your tragedy if you were to give it to me for nothing.'

'Mr. Colophon,' answered the youth, 'do not insult my janias. I know that it has always been the custom for you pettifoggers to insult great men. But, sir, though Shakspeare, and Milton, and Otway may have been thrated in this ungentlemanly way by their publishers, I tell you that my name is Theophilus O'Rourke, and I will not. You had better give me the 200*l.* or I will shake your dirty soul out of your ugly carkish.'

'Mr. Simpson, Mr. Drake, Mr. Peebles!' exclaimed Colophon, to the gentlemen in the shop, and they immediately entered the room. The bookseller desired one of them to go for a constable, and the other two to hold Mr. O'Rourke.

'Is it for a constable you'd be sending?' cried the Irishman, 'and is that the way you thrate a jantleman for letting you publish this thragedy? now, by the L—d, I tell you I would not give you a farthing to publish it—I would not let your unclain pathronymic go down to posterity on the title page of "Aspasia," (for that's the name of the tragedy I won't let you have the printing of), not if it did not cost me more than a sixpence.' And so saying, Mr. Theophilus O'Rourke, who seemed to have had great difficulty in keeping his hands from the person of Colophon, broke from the house.

The attendants left the room, and the Scotchman and the publisher stood face to face. The former was a stout red-haired man, apparently under thirty; and he now said, very deliberately, 'Mr. Colophon, my name is Ninian Saunders, and I have been all my life a student. As you vary judiciously observed to that callant, wha, in my private opinion, is either wud or waur, a tragedy is an ower trifling and insignificant wark to have much success in sae intellectual an age as ours. Na, na, sir, this is an age of pheelosophy, and I think ye wunna be displeased to hear that I hae brought you a part o' a treatise of intellectual pheelosophy; whilk has naething whatever to do with the outward world, nor with any thing that is commonly talkit of, or understood, or felt by mankind in general. It is a leetle in the style of our Davy Hume, only with mair contempt for the prajudices o' society; and mair parfic in the neeceties o' English composition. And as to the terms, I am not extravagant in my desires. Only as there is a muckle difference between warks o' a temporary and warks o' a permanent entarest, and as this one o' mine is more abstract, and therefore less likely to be affected by circumstances than

ony ether exeesting, I do not ask more than feev^e thousand pounds for the four volumes, whilk I have nae doubt you will see to be a vary moderate request.'

'I am sorry,' replied Mr. Colophon, 'that philosophical warks are not in my line; and that I must, therefore, decline to enter into any negociation on the subject.'

'O! vary weel,' replied the Scotchman, 'if your business is with more freevolous productions, you are doubtless vary right not to attempt a more lofty and ambeetious walk. I like humility in every mon. But I confess I did na think to have found any one in our age of intelluc wha wad clean throw away, as it were, his ain gude fortune. I wish you a vary gude morning.'

I was now set free from my confinement, and as my uncle, the vicar, was willing to pay the expense of printing his pamphlet, I settled my business with Mr. Colophon at less cost of trouble and wrangling than his other visitors.

TRAVELS IN TURKEY.

Travels in Turkey, Egypt, Nubia, and Palestine, in 1824, 1825, 1826, and 1827. By R. R. Madden, Esq. M. R. C. S. 8vo. in two vols. London, Colburn, 1829.

THE medical profession has contributed to our acquaintance with outlandish climes and customs, in an equal or superior proportion to any other order of travellers. The same necessities which call them to participate the secrets of domestic life at home, are equally in all lands a passport which secures them initiation into the closest social mysteries: the same qualities which are naturally acquired by their professional habits of intercourse with all ranks, adapt them to the task of seizing rightly the resemblances and differences of character and manners; and the same talents, which had been requisite in aiming at professional success, conduce to quick and accurate conception and delineation, when turned on extra-professional objects. An additional recommendation to the favour of his readers is the lively form of epistles addressed to well-known names in England, into which our author has moulded (not without, we suspect, a little harmless artifice in some cases,) the results of his extended and instructive peregrinations. Nor are there wanting personal merits in himself to fulfil the favouring auspices afforded by his membership of the Royal College of Surgeons, and his attractive correspondence with Lord Blessington. These, as Dogberry might have said, are but 'the gifts of fortune': but to read and write comes doubtless to our author 'by nature.' Both of which accomplishments he displays to excellent purpose: his remarks on his precursors show the same acute perception as his original observations on the objects around him: and the substance of his work is rendered palatable 'to the general' through the medium of an uncommonly smart and neatly-finished style, contrasting strongly with the slovenliness and slip-slop which too commonly disgrace the gorgeous quartos of even our superior class of travellers. It might be harsh and premature in the first paragraph of our criticism to inquire whether aught of sharp expression or bright colouring have been purchased by the sacrifice of merits more intrinsic; whether our author may not now and then indulge his caustic mood until it brings him to the verge of contradiction or injustice; whether sometimes, in the course of his speculations, philosophy may not be sacrificed to point; and whether, occasionally, he may not, for the sake of effect, be content to swerve slightly from the functions which a traveller is considered to impose on himself when he sits down to record the unvarnished tale of his own observations and adventures.

The following sketch of Turkish beauty and fashion will show that our author has by no means thrown away his opportunities of access to the harems of Constantinople; and that those opportunities could hardly have been accorded to a more acute, intelligent spectator:—

'A Turkish lady of fashion is wooed by an invisible lover: in the progress of the courtship a hyacinth is occasionally dropt in her path, by an unknown hand, and the female attendant at the bath does the office of a Mercury, and talks of a certain Effendi demanding a lady's love, as a nightingale aspiring to the affections of a rose!

'A clove, wrapped up in an embroidered handkerchief, is the least token of condescension the nightingale can expect; but a written billetdoux is an implement of love which the gentle rose is unable to manufacture. The father of the lady at length is solicited for her hand, and he orders her to give it, and to love, honour, and obey her husband: in short, they are married by proxy, before the *Cadi*, and the light of her lord's countenance first beams on her in the nuptial chamber. This change in her condition is one which every spinster envies: if she be the only wife, she reigns in the harem over a host of slaves; if there be two or three more, she shares with them the delights of domestic sway. Every week, at least, she is blessed with a periodical return of her husband's love; he enters the harem at noonday, and at sunset, after the fatigue of sauntering from one *bazaar* to another, and from the public divan to the private chambers,—he performs his evening ablutions,—one obsequious lady fetches a vial of rose-water to perfume his beard, another bears a looking-glass, with a mother of pearl handle, another carries an embroidered napkin; and supper is brought in by a host of slaves and servants; for in most harems the ordinary attendants have access to the women's apartments. The women stand before him while he eats, and when he finishes, a number of additional dishes are brought in for the ladies, whose breeding consists in eating with the finger and thumb only, and in not devouring indecorously the sweetmeats, of which they are exceedingly fond.

'When supper is removed, and the servants disappear, there are few harems where small bottles of roseoglio are not produced; and of this liqueur, I have seen the ladies take so many as three or four little glasses in the course of ten minutes. One of the female slaves generally presents the pipe on one knee; and sometimes one of the wives brings the coffee, and kisses the hand of her lord at the same time; this ceremony every wife goes through in the morning, none daring to sit down in his presence but such as have the honour of being mothers: but, in the evening, there is very little etiquette, and very little truth in the assertion of Pauqueville, that "the Turks retire to their harems without relaxing the least particle of their gravity." The reverse of this statement is near the truth; the orgies of the evening, in most harems, are conducted with all the levity of licentiousness, and the gravity of the Moslems totally disappears: their roars of laughter are to be heard in the adjoining houses; and, in my opinion, the gravity of the Turk during the day is only the exhaustion of his spirits from previous excitement. I have seen him reclining on the divans, smoking his long *chibouque*, one of his wives, and generally the favourite, shampooing his feet with her soft fingers, and performing this operation for hours together.

'This is accounted one of the greatest luxuries of the harem; and an opium-eater assured me, the most delightful of his reveries was imagining himself shampooed by the dark-eyed *houris* of Paradise.

'The women vie with each other in eliciting the smiles of their common lord; one shows the rich silk she has been embroidering for his vest, another plays an instrument resembling a spinet, and another displays her elegant form in the voluptuous mazes of the dance. No handkerchief is thrown, but a smile is sufficient to "speed the soft intercourse from soul to soul;" and from that moment to the period when another favourite supplants the former, she is *salaamed* with additional respect by the slaves, and treated with greater honour by all the *harem*. When she goes to the bath she is to be distinguished by the importance of her air; the waddling of her gait attests her quality; she disposes her white robe over her fair arms so as to present the largest possible surface of face, and God help the unlucky Christian who crosses her path. I have had the honour of being insulted by ladies of rank far more frequently than by any other women. The fanaticism of females is in a ratio with their quality, and hence it is from them, chiefly, a Frank passenger has to expect such gentle maledictions as, "May the

plague fall on your house!" "May the foul birds defile your beardless chin!" "May she who would marry you be childless!"

In fact, education in Turkey has no other object but to foster fanaticism, and to inculcate intolerance. When the lady visits her female friends, notice is previously sent of her intention, that the men may have time to get out of the way; the moment she enters the harem she takes off her veil, receiving a thousand *salaams*, smokes a pipe or two, and is regaled with fruit, sweetmeats, and lump sugar. The conversation commonly turns on dress; she discusses various topics connected with silks and scandal, narrates how a fair neighbour of hers was suspected of embroidering a silk purse for a stranger, of lifting her veil in the street, and conversing with a man; every gentle listener expresses her horror at such depravity, voids her rheum on the floor when she hears her name, and appears quite delighted when she is told that the husband happily intempered, and consigned the naughty woman to a watery grave. I was once present at such a conversation, and was astonished to hear the women applaud the spirit of the man, instead of compassionating the fate of the unfortunate victim of jealousy or justice. Such a fashionable lady as I have been describing has little cause to complain of the seclusion of the harem. She rides in her gilded coach, drawn by a team of oxen. She sails in her gay *caïque* along the lovely shores of the Bosphorus; slave as she is called to the caprices of a tyrant, she reigns in the harem, her empire over the household is unlimited, her influence over her husband is unbounded, and to her Metastasio might well have said, "Siete schiava, ma regnate nella vostra servitu."

A Constantinople man of quality is a slow-paced biped, of a grave aspect, and a haughty carriage; he assumes an indolent air and shuffling gait, the former is *nonchalance*, the latter *bon tan*. He wears his turban over his right eye, sports a nosegay in his bosom, and is generally to be distinguished from the million by the magnitude of his pantaloons. He sits for hours smoking his *chibouque*, wrapped up in a reverie, the delight of which avowedly consists in the absence of thought. He has been educated in the imperial seraglio, he has risen to honours from the depths of infancy, and after serving his youth in slavery, he is preferred to some office in the state, or is advanced to the government of some distant province; in middle age he can perhaps read and write, and repeat every favourite chapter of the Koran from beginning to end; but this is all his knowledge, and he turns it to the account of plunder. From sentiment and custom he hates a Christian, but then the Christian abhors a Jew, the Jew abominates a Greek, the Greek contemns a Copt, the Copt abjures an Armenian, the Missionary pities each, and Heaven bears with all! He believes no less firmly than the Christian *Rayah* in the truth of his creed, and that no other leads to Paradise. His fanaticism is fundamentally the same as the superstition of the Greek, and the bigotry of the Armenian, and is only modified in its external forms by the diversity of religious rites. In his domestic relations, he differs little from the Christian; his bosom is agitated by the same passions, his actions are swayed by the same motives, his understanding is warped by the same prejudices, he has the same kindly feelings in his family, he loves his little children with the same affection, regards his wife with no less deference, treats his domestics with at least as much humanity, shows his aged parents the same respect, and follows at their bier with the same bitterness of heart. It is not because his turban differs from a hat, or his *caftan* from a surtout, that he is either vile or virtuous; it is not because *Ramazan* is different from Lent, that his manners or his morals are either corrupt or pure. His inherent hostility to Christianity is the first principle of his law; and the perfidy it is supposed to enjoin is the most prominent feature in his character: I say supposed to enjoin, for though the Koran inculcates *passion*, the extermination of Christians in open warfare, it no where approves of the treachery and inhumanity of which the priesthood make a merit. But persecution is one of the amiable weaknesses of all theologians, and it would be a folly to stigmatize the church of Christ with the charge of intolerance, because Calvin, moderate as he was, pursued a theological opponent even unto death. The most striking qualities of the Moslem are his profound ignorance, his insuperable arrogance, his

habitual indolence, and the perfidy which directs his policy in the divan, and regulates his ferocity in the field. The defects in his character are those of the nation: they are the growth of sudden greatness—the intoxication of prosperity enjoyed without reason or restraint. Before conquest and plunder had exalted the nation on the ruin of other realms, the Turk was brave in the field, faithful to his friend, and generous to his foe. It was then unusual to commend the cup of poison with a smile, and to beckon to the murderer, with the oath of friendship on the lips: but treachery is now an accomplishment in Turkey; and I have seen so much of it for some time past, that if my soul were not in some sort attuned to horrors, I should wish myself in Christendom, with no other excitement than the simple murders of a Sunday newspaper.

The grandee, however, relaxes from the fatigues of dignity pretty often; he perambulates with an amber nosey dangle from his wrist; he looks neither to the right nor to the left; the corpse of a *Rayah* attracts not his attention; the head of a slaughtered Greek he passes by unnoticed; he causes the trembling Jew to retire at his approach; he only shuffles the unwary *Frank* who goes along, it is too troublesome to kick him! he reaches the coffee-house before noon, an abject Christian *salaams* him to the earth, spreads the newest mat for the *Effendi*, presents the richest cup, and cringes by his side to kiss the hem of his garment, or, at least, his hand. The coffee peradventure is not good: the *Effendi* storms—the poor Armenian trembles; he swears by his father's beard he made the very best; in all probability he gets the cup at his head, and a score of maledictions, not on himself, but on his mother. A friend of the *Effendi* enters, and after ten minutes repose they salute, and exchange *salaams*. A most interesting conversation is carried on by monosyllables at half hour intervals. The grandee exhibits an English penknife; his friend examines it, back and blade, smokes another pipe, and exclaims, "God is great."

Pistols are next produced, their value is an eternal theme, and no other discussion takes place till a grave old priest begins to expatiate on the temper of his sword. A learned *Ulema*, a theologian and a lawyer (for here chicanery and religion go hand in hand), at length talks of astronomy and politics, how the sun shines in the east and in the west, and every where he shines, how he beams on a land of Mussulmans; how all the *Padis* shaws of Europe pay tribute to the Sultan; and how the *glaours* of England are greater people than the infidels of France, because they make better penknives and finer pistols; how the Dey of Algiers made a prisoner of the English admiral, in the late engagement; and, after destroying his fleet, consented to release him, on condition of paying an annual tribute; and how the Christian ambassadors came, like dogs, to the footstool of the Sultan, to feed on his imperial bounty. After this edifying piece of history, the *Effendi* takes his leave, with the pious ejaculation of "*Mashallah*," how wonderful is God; the waiter bows him out, overpowered with gratitude for the third part of an English farthing, and the proud *Effendi* returns to his harem: he walks with becoming dignity along; perhaps a merry-andrew, playing off his buffooneries, catches his eye,—he looks, but his spirit smiles not, neither do his lips, his gravity is invincible, and he waddles onward, like a porpoise cast on shore: it is evident that nature intended him not for a pedestrian animal, and that he looks with contempt on his locomotive organs. This, my lord, though apparently a ridiculous portrait, is not surcharged, and is, indeed, rather a general picture than an individual likeness.—Vol. I., pp. 9–22.

We extract some odd professional encounters of our author, as illustrative of his own remark, that 'the state of medicine may be considered as the criterion, or barometer, of the state of science in a nation.'

In a few days after this my first visit in Constantinople, I was sent for to the house of a grandee, where a consultation was to be held on a Pacha's case, and one of great importance. I found the patient lying in the middle of a large room, on a mattress spread on the carpet; for "the four-posted beds" of Don Juan and Dudu have no existence in Turkey, and both gentlemen and ladies repose on their mattresses thrown on the carpet of the

divan, in their daily habiliments, none of which they doff at night.

A host of doctors, Jews, Greeks, Italians, and even Moslems thronged round the sick man; and amongst them were jumbled the friends, slaves, and followers of the patient; the latter gave their opinion as well as the doctors; and, in short, took an active share in the consultation. But he who took upon himself to breach the case to the faculty, was a Turkish priest, who administered to the diseases both of soul and body. He prefaced his discourse with the usual origin of all things: he said, "In the beginning God made the world, and gave the light of *Islam* to all the nations of the earth. Mahomet (to whose name be eternal honour) was ordained to receive the peripatetic volume of the Koran from the hands of the angel Gabriel; which book was written by the finger of God, before the foundation of the world; and in its glorious page was to be found all the wisdom of every science, whether of theology or physic; therefore all learning, except that of the Koran, was vain and impious; therefore he had consulted it in the present case, and the repetition of the word honey, he discovered tallied with the number of days his highness suffered (to whom God give health); therefore honey was a sovereign remedy, and one of its component parts was wax, a true specific for the disease before them. Did not the bee suck the juice of every herb? was there not wax in honey? did not wax contain oil? therefore, why not try the oil of wax? Oh, illustrious doctors," he continued, "let us put our trust in God, and administer the dose: our patient has been thirty-six days sick, therefore let him have six and thirty drops every six and thirty hours. And as there is but one God, and Mahomet is, therefore, his prophet, let the oil of wax be given!"

The moment this signorole ended, all the servants, and even many of the doctors, applauded the discourse.

There was no time allowed for discussion; the same archpriest took care to see the doctors fed forthwith; each of us got four Spanish dollars, and left the unfortunate sick man to his fate; but going out, when I expressed my astonishment to one of the faculty (an old Armenian), about the exhibition of this new remedy, he looked around him cautiously, and whispered in my ear the word "poison!" On further inquiry, I found the bulk of the patient's property was invested in a mosque. In spite of the remonstrance of my drogouman, I returned to the door I had just quitted, and gave an attendant to understand, his master would die if he took the medicine. The poor man died however: I heard of the event about a month afterwards.

I was shortly after called to a man who was said to have a fever; when I visited him, I asked what was the matter with him, and where he felt pain? but his friends made the customary reply, "That is what we want to know from you; feel his pulse and tell us!" I accordingly did so, found it rapid, his breathing laborious, and his skin hot; but not one of the symptoms could I get from the patient or attendants. The Turks have the ridiculous idea, that a doctor ought to know every disease by applying the fingers to the wrist. I thought, from what I observed, I was warranted in taking blood in this case. I did so; but no sooner had I bound up the arm, than I was requested, for the first time, to examine the other hand: which I did; and, to my utter astonishment, found two of the fingers carried away, the bones protruding; and then only was I informed, that the patient was in the artillery, and had lost his fingers a week before by the explosion of a gun.

I suspected at once the occurrence of locked jaw; I felt his neck, it was like a bar of iron; the man had been labouring under tetanus for three days, and died the following morning. You may well conceive my indignation at such incredible stupidity as the attendants exhibited here, and my choler at being told the result "had been written in the great book of life," and could not be avoided or deferred. Be that as it may, I certainly would not have bled him, had I any reason to suspect the affection of which he died. You may imagine how difficult it is for a medical man to treat such people; and, consequently, how rarely they are benefited by him. There are few Mahometans who do not put faith in amulets; I have found them on broken bones; on aching heads, and sometimes over love-sick hearts. The latter are worn by young ladies, and consist of a leaf or two of

the hyacinth, which the Turks call mus-charumi; this is sent by the lover, and is intended to suggest the most obvious rhyme, which is ydakerumi, and implies the attainment of their soft desires.

"Sometimes these amulets are composed of unmeaning words, like the *abracadabra* of the ancient Greeks for curing fevers, and the *abracalans* of the Jews for other disorders. At other times they consist simply of a scroll, with the words "Bismillah," "In the name of the most merciful God," with some cabalistical signs of the Turkish astrologer Geffer; but most commonly they contain a verse of the Koran.

"I think the most esteemed, in dangerous diseases, are shreds of the clothing of the pilgrim camel which conveys the Sultan's annual present to the sacred city; these are often more sought after than the physician, and frequently do more good, because greater faith is put in them.

"The most common of all these charms is the amber bead, with a triangular scroll, worn over the forehead, which the *Marabouts* and the Arab sheiks manufacture, and is probably an imitation of the phylacterics which the Jews were commanded "to bind them, for a sign, upon their hands, and to be as frontlets between their eyes." It would be well if no more preposterous and disgusting remedies were employed; but I have taken off from a gun-shot wound a roasted mouse, which, I was gravely informed, was intended to extract the ball."—Vol. I.—pp. 59—64.

We take leave, for the present, of this keen and versatile letter-writer, with a hearty acknowledgment of the pleasure which his volumes have afforded us. None who resort to the work for mere amusement, will, we venture to say, leave it with ennui; and those who may consult it with intent more serious, will find instruction both on general and professional subjects.

(To be continued.)

THE FIVE NIGHTS OF ST. ALBANS.

The Five Nights of St. Albans. 3 vols. Blackwood, 1829.

THIS book is strangely born out of due season. The age of extravagant, supernatural romance is gone. That kind of thought and imagery can never now be used but in subordination to a strong human interest; and all that the book contains of this, is wretchedly marred and baffled by the result. In the days of Mrs. Ratcliffe it would have had more success than its author can now hope for; but we have seen so many recent works in which supernatural machinery has been successfully employed, that 'The Five Nights of St. Albans,' must, we fear, speedily sink into that one long night of oblivion, which is equally exempt from the horrors and splendours of romance. So supernatural a work as this can never be very interesting, except when it embodies, in these wild fictions, some one strong idea, so real and powerful as to communicate a portion of its own truth to the pageantry through which it is displayed—which is not the case with the work before us; or where the machinery and circumstances themselves are filled with poetry, and so render us comparatively indifferent to the nominal purport of the tale—and neither can this be said of 'The Five Nights of St. Albans.' It contains, however, some eloquent passages, some picturesque, some surprising. There is also a good deal of talent in the discrimination of many of the characters. The opening wonder must, we imagine, startle into laughter almost every reader who is not a sworn foe to that pleasant kind of convulsion. We have, therefore, extracted the greater portion of the first chapter; and so leave the book, assuring our readers, that the marvels with which we present them are in these volumes but a foretaste of the greater wonders that follow.

"It was towards the latter end of September, in the year 1570, that Hugh Clayton, and Marmaduke Peverell, two substantial yeomen of the ancient town of St. Albans, were returning home from Dunstable, when, just upon the hour of midnight, they came within sight of the venerable towers of the Abbey. They were proceeding leisurely along, their horses somewhat the worse

of a long day's journey, as the Abbey bell tolled the first hour of twelve. Suddenly, the whole building presented the appearance of one solid mass of a deep-red fire, but without casting forth flame or smoke, or shedding one ray of light upon surrounding objects. It resembled a huge furnace, glowing with intense heat; and from the magnitude of the building, the effect was at once terrific and sublime.

"Peverell was the first who observed the strange spectacle. "By my soul," said he, stopping his horse, "the abbey is on fire—look how it is burning!"

"Burning," quoth Clayton, "truly I think the burning is all over, and what we see are only the ruins! for, do you mark, there is neither smoke nor flame."

"You are right," rejoined Peverell, "and, what is strange, there seems no bustle in the town. Listen! all is still, and, save yon burning mass, all is dark. Let us push on, and learn what has happened." So saying, they clapped spurs to their jaded steeds, and in a few minutes entered the town.

"To their great surprise, they found no person stirring. Every house was closed; and the inhabitants were all asleep in their beds. But still greater was their surprise, when, directing their looks towards the Abbey, they could no longer perceive the burning ruins which had first attracted their notice.

"What can all this mean?" said Peverell, in a half-whisper, to his companion, "We saw it, and now—"

"Hush!" interrupted Clayton, while he crossed himself devoutly; "let us watch for a few minutes."

"They did so; but to no purpose. Where they had seen the fiery edifice, was now a mere black void; for the night was too dark to permit of their distinguishing the towers or walls of the abbey.

"Are we awake?" continued Clayton, after a pause, "or have we been dreaming all this time?"

"It was no dream," answered Peverell, "and for my own part, I am determined to find out whatever it is. I'll ride up to the abbey door, and if the arch-fiend himself be sitting there, I'll ask him what he has been about."

"Don't be fool-hardy," exclaimed Clayton, catching hold of the bridle of Peverell's horse; "you know there are strange stories told about this abbey,—since the grievous sin committed by our eighth Henry. They do say—"

"Yes," rejoined Peverell, laughing, "they do say that the devil, once a-month, feasts and revels here, with a few choice souls of monks and friars, whom he brings with him to revive the recollection of old times, when the oily rogues themselves wallowed in lusts of the flesh, as pious churchmen of those days were wont to do."

"In a few minutes they were under the walls of the abbey—and to their mutual surprise, there stood the walls, massive, gloomy, and frowning, just as they had seen them in the morning when they set out for Dunstable."

"It has been already observed, that ere noon, one moiety of the townsfolk of St. Albans, were engaged in discussing this marvellous adventure; and before sunset, it may be doubted whether there was a tongue in the whole place, from lisping infancy to mumbling age, of which it had not been the burthen. So thoroughly had it taken possession of the minds of all, that as midnight approached, the town, instead of sinking into quiet repose, presented a scene of singular bustle and excitement. No one thought of going to bed. They who lived in houses which commanded a view of the abbey, were seated at their windows, with their eyes fixed on its grey towers and dusky walls; while hundreds of others, men, and women and children, the old and the young, the infirm and the crippled, gradually gathered themselves into groups, at every spot whence the edifice was visible."

"The night was dark, but in the deep blue vault above, myriads of stars were gleaming with that calm lustre, which seemed to shed no light beyond their own spheres. And now a scene presented itself which struck terror into the stoutest heart. The abbey clock began to strike—when suddenly a sound like the rushing of mighty waters, or of a blast of wind roaring through a grove of forest trees, was heard, and the next moment, devouring flames appeared to wrap the walls in one vast sheet of fire. A cry of horror burst from the multi-

tude—the shrieks of women, and the screaming of children, were mingled with the hoarser exclamations of fear uttered by the men; some fled in dismay, others threw themselves on the ground; wives clung round the necks of their husbands for safety, and hundreds fell upon their knees in a wild agony of prayer. Meanwhile, the rushing noise continued with increasing loudness—the flames tossed and heaved about, like the waves of a troubled ocean, now seeming to dart from the windows in masses resembling pillars of fire; then curling up the walls as if instinct with life, or flickering in fantastic shapes round the buttresses and towers. But most strange it was, that neither light nor heat was emitted from this awful mockery of a conflagration. From the bottom to the top, it was one burning surface; yet the grass and weeds that fringed the former, were no more revealed to the eye by it, than they were before the mysterious volcano blazed forth.

"While the affrighted inhabitants were still under the first influence of this appalling scene, the abbey clock struck the last hour of twelve, and the whole vanished."

"The consternation was, if possible, increased by this new wonder; but it was the consternation of dumb amazement. In a moment every voice was hushed, and the expectation of some fresh horror held them in breathless silence and motionless suspense. They who were fleeing in dismay, suddenly stopped, they hardly knew why. If the wand of a magician had been waved over their heads, with power to fix them to the earth, like so many statues of lifeless stone, the effect could not have been more instantaneous and complete. In a few minutes, the spell began gradually to dissolve; and group after group slowly retired, discoursing, in voices not raised above a whisper, of what they had beheld; or fearfully conjecturing what it might all portend."

"One melancholy circumstance accompanied this night of mystery and panic. A poor idiot girl, about sixteen years of age, had been left in bed by her mother (who was of humble occupation), while she stole out to join the throng of anxious spectators. It was never known under what impulse, or in what way, this witless creature, with merely her night-clothes on, had wandered forth; but so it was; for on her return, the distracted mother found her gone; and the next morning she was found a corpse, beneath the walls of the abbey. Whether she had strayed unobserved to the spot, beheld the strange scene of the night before, and fell a victim to terrors which she could only feel, but not express; or whether, having roamed beyond the knowledge of return, she, after awhile, laid her down to sleep, close by what she deemed a warming fire, and so perished from cold, thinly clad as she was, could be nothing more than surmise. It was too true that the poor idiot died, and that her wretched self-accusing mother, felt more than a mother's anguish for her death. She was her only child, and the very calamity which shut her out from all the rest of the world, made her tenfold more dear to her. "She could have borne her loss," she said, "had it pleased God to take her in the usual way; but she knew her poor Marian had gone in search of her, who has never left her thus before, and so she met her death; and that thought she could not bear."

PHENOMENA OF THE HUMAN MIND.

Analysis of the Phenomena of the Human Mind, by James Mill, Esq. 2 vols. 8vo. Baldwin. 1829. (Concluded from p. 373).

THE mistakes which may be admitted with regard to the nature and method of physical inquiry, when shifted from the outward to the inward world, acquire a different complexion and consequence. In analysing the phenomena of external nature, not only must obscurity be suffered to remain about the earliest antecedence in the order of causation—the highest generality of motion—the primary law of nature—but an obscurity indeed which many inquirers into mind may consider to be in their own department equally impenetrable: but a certain degree of ignorance of the general ends of science may not exclude success in some of its branches. Observations, however imperfect, may be sufficient

• Bacon.

for the furtherance of human action; analysis, however incomplete, may be rewarded by the discovery of elements of separate use and value; experiment is constantly at hand to submit the visions of the mind to the correction of the senses. Experiment, moreover, may be made *in corpore vili*, and the worst effects of error may extend no farther than the failure of an engine or a manufacture. Chemical art will not now undertake to rival nature in the production of her recondite substances; and no mechanical masterpiece, except in a novel, will be framed to ape the phenomena of life and organisation.

But the comparative impunity of unphilosophical observers of the outward world should induce us to be cautious in accepting their account of the analogies between physical and moral investigation: for, in a system of mind, none of its phenomena must be left out of account for an instant, no element can be separated and viewed by itself to any furtherance of truth or utility; no experiment addressed to the senses can rectify the deceptions which the mind may put on itself with regard to its own quality and nature. Hence, the first condition requisite to success in this department, is a full and conscientious process of self-examination in all the fleeting modes of inward experience, and an invariable habit, unseduced by sloth or vanity, of contemplating every form of thought or feeling in its native light; and determinately keeping it in that distinct position to which our healthiest state of consciousness decides it to belong. Hence, too, the high requirements and immense responsibility imposed on him who pretends to give an account of all the faculties and manifold emotions of the human mind. All science is concerned in the safe conduct of his enterprise: for all science, in so far as it is viewed but in the 'insincere mirror' of our intelligence,* must, in no insignificant measure, be affected by our estimate of the nature and extent of our own powers, and by the direction which we are consequently prompted to give them. One inquirer starts from notices derived through the senses; and from these, and the ideas they impart, proceeds to deduce the whole moral constitution of our nature. Another swells our catalogue of primary endowments with sympathies, instincts, and affections, unsusceptible of analysis into simpler sensations. A third detects a purely moral element in our nature, affirms its universality as a spiritual essence, and proclaims it the sole guiding light to science and truth. It is evident at once, how widely different must be the path of each psychologist from the outset.

No reader of Mr. Mill can long be left in doubt with regard to the line and method of inquiry which he has judged the most appropriate to his subject and principles; and no opponent of these will hesitate long in setting him down among the votaries of *sensation-philosophy*. The naked and concise style in which he has exhibited the outline and dimensions of his system point out its obnoxious members to polemical dissection, and render critical castigation a much simpler sport in appearance than it probably will be found on experiment. Were we Edinburgh reviewers, we might not find it difficult to handle in what sense we pleased, our author's disquisitions; but, unaccustomed as we are to wield that marvellous critical mallet which could crush the fame of Montesquieu in one short paragraph, we dare not exercise summary jurisdiction over an author who, whether his conclusions coincide or not with our own, is, at all events, entitled to the treatment due to a close consistent arguer in behalf of a deliberately adopted and explicitly stated system. We have devoted our most careful and dispassionate attention to the volumes before us; and we do not believe that any one who reads them conscientiously will impeach the general accuracy with which the

leading facts which form the ground work of the system are stated, or the strict interdependence and connexion of its details with the whole design. As a whole it must be scrutinized, maintained, or condemned. Nothing is more likely than that any one whose thoughts are not exactly cast in the same mould as our author's, will find some seeming superficialness or contradiction in any two or three sections of the work which he may glance at; but the noisy reprobation of a reader of this stamp would be no rule of judgment for a calmer student. For example, the chapter of 'Consciousness,' in which the having a sensation or idea, and the being conscious of it, are affirmed to be not two things, but one and the same, may seem, at first sight, to contradict a previous section,—on 'Sensations in the Alimentary Canal,' in which it is stated doubtfully, 'that there is reason to believe that a perpetual train of sensation is going on in every part of it.' A little attention, however, to the terms of the positions which are maintained by each section, will remove the seeming discrepancy; and a reference to the chapters on 'Memory,' 'Reflection,' &c., will exhibit their connexion with the rest of the system.

There is no especial matter for remark in Mr. Mill's two first chapters on the several phenomena which he classes as composing the two primary states of 'Consciousness'—those feelings, namely, known to be derived from the senses; those which accompany the action of the muscles, or which have place in the alimentary canal; and the ideas 'which exist after the object of sense has ceased to be present.'

This portion of the work is chiefly characterised by the clear enunciation of admitted facts. The difficulty of making a satisfactory selection must also prevent us from citing any of the judicious remarks by which the nature and use of language, as presenting mental phenomena of such primary importance, are illustrated. We must also refer our readers to the work itself for much curious and instructive disquisition on the 'Association of Ideas,' and the 'Faculty of Imagination.' The concluding part of the chapter on 'Classification,' affords matter for an extract; the whole of the chapter is important.—Vol. i., p. 211.

It may still be useful to advert to the three principal cases into which Classification may be resolved; 1, that of objects considered as *synchronical*; 2, that of objects considered as *successive*; 3, that of feelings. The first is exemplified in the common classes of sensible objects, as men, horses, trees, and so on; and requires no further explanation. The second is exemplified in the class of events, denoted by such words, as Birth, Death, Snowing, Thundering, Freezing, Flying, Creeping. By these words there is always denoted one antecedent and one consequent, generally more, sometimes a long train of them. And it is obvious that each of them is, at once, the name of each instance individually, and of all taken generally together. Thus, Freezing is not the name of an individual instance of freezing only, but of that and of all other instances of freezing. The same is the case with other words of a still more general, and thence more obscure signification, as Gravitation, Attraction, Motion, Force, &c.; which words have this additional source of confusion, that they are ambiguous, being both abstract and concrete. When we say that there is a third case of classification, relating to Feelings, it does not mean that the two former do not relate to feelings: for when we say, that we classify objects, as men, horses, &c.;—or events, as the sequences named births, deaths, and so on;—it is obvious that our operation is about our own feelings, and nothing else; as the objects, and their successions, are, to us, the feelings merely which we thus designate. But as there are feelings which we do thus designate; and feelings which we do not; it is convenient, for the purpose of teaching, to treat of them apart. The Feelings, of this latter kind, which we classify, are either single feelings, or trains. Thus, Pain is the name of a single feeling, and the name both of an individual instance, but of indefinite instances, forming a most extensive class. Memory is the name not of a single feeling or idea, but of a train; and it is the name not of a single instance, but of all instances of such

a train, that is, of a class. The same is the case with Belief. It is the name of a train consisting of a certain number of links; and it is the name not only of an individual instance of such trains, but of all instances, forming an extensive class. Imagination is another instance of the same sort of classification. So also is Judgment, Reasoning, and Doubting, and we might name many more.

It is easy to see, among the principles of Association, what particular principle it is, which is mainly concerned in classification, and by which we are rendered capable of that mighty operation; on which, as its basis, the whole of our intellectual structure is reared. That principle is resemblance. It seems to be similarity or resemblance which, when we have applied a name to one individual, leads us to apply it to another, and another, till the whole forms an aggregate, connected together by the common relation of every part of the aggregate to one and the same name. Similarity, or Resemblance, we must regard as an Idea familiar and sufficiently understood for the illustration at present required. It will itself be strictly analysed, at a subsequent part of this inquiry.

So deeply was the sagacious mind of Plato, far more philosophical than that of any who succeeded him during many ages, struck with the importance of Classification, that he seems to have regarded it as the sum of all philosophy; which he described, as being the faculty of seeing "the ONE in MANY, and the MANY in ONE;" a phrase which, when stripped from the subtleties of the sophists whom he exposed, and from the mystical visions of his successors, of which he never dreamed, is really a striking expression of what in classification is the matter of fact. His error lay, in misconceiving the ONE; which he took, not for the aggregate, but something pervading the aggregate.*

We insert the following passage from the chapter on 'Time,' a mere fragment from an interesting discussion, affording, however, a fair specimen of our author's polemical style.—Vol. ii., p. 109.

"Time and space" says Mr. Harris, "have this in common, that they are both of them by nature continuous. But in this they differ, that all the parts of space exist at once and together, while those of time only exist in transition or succession." This is only transcribing the common language. What remained was, to shew what are the real facts couched under this language.

"In every given time we may assume any where a now or instant, and therefore, in every given time, there may be assumed infinite nows or instants.

"A now or instant is the bound of every finite time. But although a bound, it is not a part of time. If this appear strange, we may remember, that if a now or instant, were a part of time, it being essential to the character of parts, that they should measure the whole, it would contain within itself infinite other nows; and this, it is evident, would be absurd and impossible.

"The same now or instant, may be the end of one time, and the beginning of another; the first, necessarily past time, as being previous to the now or instant, which both times include; the other necessarily future, as being subsequent. As, therefore, every now or instant always exists in time, and without being time, is time's bound; the bound of completion to the past, and the bound of commencement to the future: from hence we may conceive its nature or end, which is to be the medium of continuity between the past and the future, so as to render time, through all its parts, one intire and perfect whole."

It must be obvious to every one, who has correctly followed me through the preceding deductions, that this mysterious language, if applied to actual successions, has a distinct meaning; if not so applied, it is jargon merely, without one idea annexed. This now, which is not time, and, not being time, is of course nothing else; this nothing, then, which, though nothing, is the medium of continuity between somethings, namely, time past, and time future, seems to be only a mysterious name for that link which is supposed to be between every antecedent and its consequent; which supposition of a link, or medium of continuity, we have already shewn to be a mere case of association, involving a prejudice; the antecedent and consequent, and nothing else, being really included

* 'Omnes perceptiones,' says Lord Bacon, (and the sentence shews the sagacious self-distrust of his whole philosophy), 'tam sensus quam mentis, sunt ex analogia hominis, non ex analogia universi; estque intellectus humanus instar speculi inaequalis ad radios rerum, qui suam naturam naturae rerum immiscet, eamque distorquet et inficit.'

in a case of succession. Thus understood, however, it is a medium of continuity, forming the "bound of completion," to the previous train of successions, the "bound of commencement" to the following.

Mr. Harris proceeds to shew some of the conclusions, resulting from the account which he had thus rendered of time. "In the first place," he says, "there cannot (strictly speaking) be any such thing as time present." We will draw from this a conclusion, which Mr. Harris appears not to have seen, or does not choose to acknowledge; That, if there be no such thing as time present, neither can there be any such thing as time past. For what is the past, but that which has been present? But if there be no such thing as time present, or time past, there can be no such thing as time future. Time, therefore, is an impossibility.

Mr. Harris himself, indeed, goes a certain way towards this conclusion. "If no portion of time," he says, "be the object of any sensation; further, if the present never exist; if the past be no more; if the future be not a yet; and if these are all the parts, out of which time is compounded: how strange and shadowy a being do we find it? How nearly approaching to a perfect non-entity."

Mr. Harris then says, "Let us try, however, since the senses fail us, if we have not faculties of higher power, to seize this fleeting being." What then is it he does in search of those "faculties of higher power?" It will be seen, from the following quotation, that he merely describes a few cases of actual succession; and says, that from them, by the help of memory and imagination, we come by the idea of time. But the memory and imagination of successions present to us nothing but the successions themselves. If then the memory and imagination of successions, give us the idea of time, the idea of time can only be some part or the whole of the idea of the successions.

"The world has been likened to a variety of things, but it appears to resemble no one more than some moving spectacle (such as a procession or a triumph) that abounds in every part with splendid objects, some of which are still departing, as fast as others make their appearance. The senses look on, while the sight passes, perceiving as much as is immediately present, which they report with tolerable accuracy to the soul's superior powers. Having done this, they have done their duty, being concerned with nothing, save what is present and instantaneous. But to the memory, to the imagination, and above all, to the intellect, the several nows or instants, are not lost, as to the senses, but are presented and made objects of steady comprehension, however, in their own nature, they may be transitory and passing.

"Now it is from contemplating two or more of these instants under one view, together with that interval of continuity which subsists between them, that we acquire insensibly the idea of time. For example: the sun rises; this I remember: it rises again; this too, I remember. These events are not together; there is an extension between them—not however of space, for we may suppose the place of rising the same, or at least, to exhibit no sensible difference. Yet still we recognise some extension between them. Now what is this extension, but a natural day? And what is that, but pure time? It is after the same manner, by recognising two new moons, and the extension between these; two several equinoxes, and the extension between these; that we gain ideas of other times, such as months and years, which are all so many intervals, described as above; that is to say, passing intervals of continuity between two instants viewed together.

"And thus it is the mind acquires the idea of time. But this time it must be remembered is past time only, which is always the first species, that occurs to the human intellect. How then do we acquire the idea of time future? The answer is, we acquire it by anticipation. Should it be demanded still further, And what is anticipation? We answer, that in this case, it is a kind of reasoning by analogy from similar to similar; from successions of events, that are past already, so similar successions, that are presumed hereafter. For example: I observe, as far back as my memory can carry me, how every day has been succeeded by a night; that night, by another day; that day, by another night; and so downwards in order to the day that is now. Hence, then, I

anticipate a similar succession from the present day, and thus gain the idea of days and nights in futurity. After the same manner, by attending to the periodical returns of new and full moons; of springs, summers, autumns, and winters, all of which, in time past, I find never to have failed, I anticipate a like orderly and diversified succession, which makes months, and seasons, and years, in time future."

It is to be observed, that, in the above passage, Harris, beside memory and imagination, introduces the name of intellect, as concerned in generating the idea of time. But it will be seen that he makes no use of it, whatsoever, in giving his explanation, nor mentions any other operations than those of, memory for the past, and anticipation for the future. Indeed it appears, from a passage of his work, immediately following, that when Mr. Harris, in this inquiry, uses the word intellect, he means nothing but anticipation and memory. "There is nothing," he says, "appears so clearly an object of the mind or intellect only, as the future does, since we can find no place for its existence any where else. Not but the same, if we consider, is equally true of the past." Here we see, that both the future, and the past, are said to be objects of the intellect only. But the future is the object of anticipation, the past of memory; and both memory, and anticipation, as we have seen, are cases of association.

In the cases of succession which he adduces, as examples, to shew in what manner we acquire, he says, "insensibly," the idea of time, he tells us, there is sensation of the consequent, memory of the antecedent, and beside these, "contemplation of two or more instants under one view, together with that interval of continuity, which subsists between them." But the contemplation of two instants, one prior, another posterior, in one view, with the interval between them, is a circumlocution for memory. It denotes, obscurely and imperfectly, that union, in one idea, of all the parts of a train, to which the name memory is affixed. From this contemplation, he says it is, "that we acquire the idea of time." The real meaning is thus shewn to be, that we acquire it from memory. Mr. Harris, therefore, at the bottom, agrees with Dr. Reid; and the same observations by which we shewed the imperfection of Dr. Reid's account, are equally applicable to that of Mr. Harris. The case, in truth, is, that neither of them does any thing more than merely state the fact, without an attempt to explain it. That we cannot have the idea of time, without the observation of successions; and that memory is joined with sense in the observation of successions,—is the matter of fact. What time is, distinct from the memory and the sensations, they ought to have told us, but have not. They would not have found it difficult, had they been familiar with the distinction (of such infinite importance, in all accurate inquiries into the human mind) between the mode of signification of concrete words, and the mode of signification of abstract ones; the latter, in its more complicated cases, of not very easy comprehension. Unfortunately, we have no concrete term, corresponding with time. Hence a great part of the difficulty of conceiving distinctly the meaning of the abstract. Time, also, is not the abstract name of any one train, but of all trains; as redness is not the name of one red, but of all reds. And there is this further complication, that the word "time" is never applied to any train, in particular; as time of a race, time of a battle, and so on; without the predominating association of that particular train, whatever it be, minutes, hours, or days, which we are accustomed to employ, as the measure of other successions. Without much and accurate practice, therefore, in conceiving the meaning of abstract terms, especially in the more complex and intricate cases, it is extremely difficult steadily to contemplate either time, as the abstract name of all successive, or space, as the abstract name of all simultaneous order.

THE ADVENTURES OF A KING'S PAGE.

The Adventures of a King's Page. By the Author of 'Almack's Revisited.' 3 vols. Colburn, 1829.

THE only kind of novel which has of late much departed from the standard of the common, historical, and foreign romance, is that to which 'The King's Page' belongs. It is a light and sketchy exhibition

of fashionable society, framed in a story of sufficient interest, and accompanied by some glimpses of the war in the Peninsula. It is very easily and pleasantly written, and some of the dialogues are extremely clever, much more so, we apprehend, than the conversations of which they profess to be copies.

We have, however, some causes of quarrel against the author. In the first place, the name has evidently been forced on him by his bookseller. If twenty pages were cut out of the three volumes, there would not be a trace remaining (except in the running titles) of the hero's courtly dignity. We can conceive nothing more disgraceful for a literary man (if indeed, the author at all aspires to that character) than this kind of submission to his tradesman. It is to proclaim at once, that the book has no purpose or meaning of its own beyond that of obtaining a certain sum of money.

We also very decidedly object to the portraits and caricatures of living and well-known individuals, several of which are introduced in 'The King's Page.' It really would seem that there can be very few general vices and follies among our aristocracy, when half a dozen novelists find themselves reduced to enliven their works by personal attacks on the Duchess of St. Alban's, which, by the way, are bad compliments to her hundreds of noble and fashionable guests. This to be sure is, perhaps, the only circumstance that gives point and interest to such easy satires. There may, perhaps be inexhaustible enjoyment in ridiculing and abusing a person at whose table we yesterday feasted; but it might be as well if authors would remember that, to the greatest number of their readers, this source of literary pleasure is wanting. If a foreigner were to judge of England by Mr. Colburn's novels and the weekly newspapers, he would suppose that no earthly (or indeed heavenly) object is so important to the country as the hunting down by ridicule, and very often by calumny, one rich and ostentatious woman.

It might, moreover, be as well if the 'author of Almack's Revisited' would remember that he can produce little impression on the mind of any one by his ever-recurring panegyrics on all and each of the royal family. The characters of many of the exalted personages who are eulogised severally and in the lump, on about one hundred and fifty different and unsuitable occasions in the course of these volumes, have become matter for history; and the consequence of covering alike the living and the dead with indiscriminate and extravagant praise, must necessarily be to suggest to every reader the counterbalancing defects and vices which are even more, perhaps, in some cases, than would suffice to prove our princes and princesses not quite the faultless divinities prated of in these pages. If the royal family were considerably worse than, on the whole, they have ever been charged with being, there still would not exist much reason to fear the spread of disloyalty among us; and we really can see no use in larding our literature with panegyrics which every one knows to be exaggerated and foolish. We are satisfied that the Guelphs are morally very superior to the Bourbons or the Tsars; and our institutions and national spirit happily do not make it necessary to our welfare that they should be hereditary arch-angels.

The last point on which we intend to complain of the author before us, is the excessive vanity which he seems to feel at the circumstance of his being admitted to society where 'which' is not used for 'who,' nor 'two negatives employed instead of one.' This English madness of believing that there are no educated or agreeable people in the country beyond a circle of some one thousand families, at the very utmost, has now lasted so long that we may hope it will soon become unfashionable. Of this we are very sure, that, in the highest and most cultivated society, the persons whom every one would allow to be models for manner and accomplishment, are the least likely to treat with arrogance and contempt people of as good education and habits as themselves, though less distinguished for rank, wealth, and luxurious elegance.

There still remains the general accusation against this and a score of similar works, that they display no power of conceiving any thing which their authors have not seen; that they do not at all exercise the imagination or the intellect of their readers; and that the amusement which they afford is, therefore, of the most passive and meagre kind, leaving the weakest relish on the palate, and furnishing the most watery nutriment to the life-blood. Into this wide field of discussion we do not now design to enter, but prefer to conclude with an extract, which cannot fail, we think, to amuse our readers:

At the moment of Lady Roxmere's visit to Birkenholt, the family of Sir Stephen was assembled in the eating-room, busily occupied in the discussion of one of those substantial luncheons which so fortunately intervene in the country to break through the tediums of the day, when rainy weather, or the cessation of field sports, confine your real young country gentleman to the house, and leave him entirely at the mercy of his own intellect and resources: which latter may be classed under the following heads.

Sitting for an hour or two on a cornbin, listening to the harmonious sounds with which the grooms accompany their manual operations on the heels of the horses. Smoking segars in the harness-room, or keeping his hands in practice for driving, by tickling up the pigs as they lie buried in the straw of the farm-yard with a four-horse whip. Teaching Tom, the tail-less stable-cat, to jump through his arms, and then rewarding the poor animal's docility by worrying it with half a dozen terriers. Establishing a fight between his mother's pet-pug, Bijou, and the housekeeper's favourite tabby, Bess. Whistling to the turkey-cocks until they gabble and swell themselves into a state of apoplexy. Dogs-eating books of prints and etchings; humming out of tune "Cherry ripe!" and the not less eternal Jager Chorus; curing his younger brothers' chilblains by rapping their knuckles with back-swords; and spoiling his sister's superfine scissors and work-boxes, by scratching mail-coaches on the lids of the one with the points of the other.

Several of these interesting amusements had been tried in their turn by young Squire Stephen Cornwall, who, having satiated himself with cold pie and ale, was busily employed in tracing the circumference of a coach-wheel with a three-pronged fork on the table-cloth: upon lifting up his eye towards the park, he exclaimed, "I shall bolt; here come some of your big-wig visitors: I saw the flunkies bobbing up and down before the drag, like apples in a mill-stream." The attention of the rest of the party was attracted towards the park by this very ingenious observation; and there was a general exclamation of, "I declare! a carriage passing through the park-gates!"—"So early, my dears," said the mamma; "it surely can be none of our expected party!"

"Some horrid boring neighbours who have heard of it, perhaps, coming to give you a hint to ask them," observed Miss Dora Cornwall.

"Do, my dears, reconnoitre," answered the lady of the mansion. Two or three of the young ladies immediately flew to a table, on which stood a large telescope, placed there for the special purpose of examining visitors, long ere they reached the house; by which clever precaution, the inmates obtained sufficient time either to issue the repulsive "not at home," or to prepare for the reception of the approaching individuals with all the ceremony of indifference due to their respective ranks. After a few moments' observation, one of the damsels exclaimed, "Six horses, and three outriders: it must be somebody of importance. Shall I ring, Mamma?"

"Who can it be? Who is it?" ejaculated the whole group.

"Probably the Lord Lieutenant coming to consult me on the disturbed state of the manufacturing classes," said Sir Stephen. "It is really very hard, that the public authorities cannot act on any occasion without troubling me for my advice."

"It's the Yarmouth heavy, more likely," said the young Squire; "to judge by the pace it comes: just look how the dragsman handles the ribands!"

"Ribands, brother!" exclaimed all the Misses Cornwall in chorus: "what! favours? Who can it be?—a wedding visit?"

"Highly improbable, my dears," said the mamma. "I should scarcely suppose that any person in the county, with six horses and three outriders, would think of marrying without previously communicating the event to us."

"Ribands!" also exclaimed the Baronet; "they must be election colours. Mr. Toadywell, in consequence of his recent appointment, has vacated his seat; there is an opening for Rottenhill—it must be the new candidate."

Delighted at having accidentally mystified his relatives, Mr. Stephen continued: "Marry! ay, marry, come up: titch! titch!" and he accompanied his words with that kind of hissing sound with which coachmen excite their horses; whilst he twisted his fingers right and left, as if he had a whip in his hand—"Ay! and as nice a pair as ever I saw!"

"Dear me," exclaimed the united band, "who can they be? How very uncivil, not even to have sent us some cake!"

"It's incredible, my loves!" rejoined the mamma.

"Why then, look yourself, mother," answered the Squire, grinning at his own wit; "and if they a'ent as nice a pair of leaders as ever you saw, then I don't know what's what."

"I must request, Stephen," said the Baronet, much annoyed, "that you will refrain, in my presence, from a style of conversation totally unbecoming your station and prospect in life: your language would even disgrace the low class of men whom it appears to be your sole aim to imitate and surpass. Can you not inform us in simple English who they are?"

"Well, that would be like driving three blind ones and a bolter," replied the incorrigible youth. "How am I to tell who's booked inside, if I haven't seen the way-bill?"

"Blue and silver! I see it plainly," said Miss Cornwall, who had taken her place at the glass. "Then it must be the Roxmerea," added another of the girls; "no one else with that livery drives six horses."

"Then ring directly for the butler, my dears. What can that horrid boring old woman want? We have not seen her so long, I was in hopes she was bed-ridden," exclaimed the godly lady.

"It is much more probable," said Sir Stephen, "that my noble friend, the Earl, is coming to take my opinion on the bill he intends bringing in next session. I have been in dread of this visit for the last six weeks. I must really announce to my acquaintance, that my health is unequal to the labours which are imposed upon me;" and then adding, "When his Lordship arrives, let him be shown into my cabinet," he retired.

"Much more likely," said Lady Cornwall, when the door closed, "that it is Lady Roxmere with one of her begging petitions; but if it is, I shall refuse. I do not think she has any claim upon my charity, since she refused to patronize my philanthropic branch of the North-east Grand Junction Auxiliary Bible Society;" and then, as the butler entered, she added,—"Potts, direct all the servants to be ready in the hall, and let them put on their best liveries."

"Their best with tags, my Lady?"

"Of course, Potts!—it is the Countess of Roxmere and six horses;—and Potts, let a hot poker be put in the state drawing-room fire."

"Are the covers to be taken off the damask chairs, my Lady?" demanded the butler.

"Certainly! if there is time. Always let that be done when it is a countess, or a person of higher degree; and let luncheon be got ready in the grand eating-room."

"Plate or china, my Lady?" asked the man.

"Plate, of course, you stupid fellow! Always plate when there are outriders: and let covers be laid for a dozen, as if we always expected many visitors."

"Very well, my Lady," replied the butler; and then turning, ere he left the room, he said, "Cape or Madeira, my Lady? there's nothing but Cape up."

"Oh! Madeira, of course; but not the old East-India, Potts.—And Potts, I forgot to say, send all the people to the inn: no guzzling, if you please, in the servants' hall."

"Yes, my Lady," answered the man; "but they always take us in at the Castle, my Lady."

"That is their affair; do as I order. And remem-

ber, no sneaking round the shrubbery with ale, Mr. Potts."

"No, my Lady," was the butler's answer; as, hastening out of the room, he muttered, "If one's obliged to treat other folks' servants in this kind of nigglerly way, we shall have other folks' servants slamming the doors in one's faces, and no getting nothing comfortable: if this is to be the go, I shall give warning, and better myself;" and he forthwith retired to the pantry, and emptied the remainder of a bottle of Cape wine, by way of consolation.

"Now my dears," said Lady Cornwall, "let us prepare for the enemy.—Dora, my love, put out some of the embroidery your governess worked for you, and employ yourself in picking out some threads.—Martha, my dear, open your drawing things, and show the sketch from nature you copied from Mr. Essel.—Bella, put the chess-men in confusion; I dare say the stupid house-maid has set them all in order.—Flora, place the book Lady Roxmere sent me to read two months ago, on my stand; and then sit down to your harp."

"The leaves are not cut of your book, and there are not ten strings left to the harp," replied Miss Flora.

"Then fetch me a volume of Sermons, or the Last Transactions of the Society for the Conversion of the Esquimaux; and crack another string just as they come in, that will answer all the purpose."

Lieutenant Cornwall, an officer in the navy, who was an old playfellow and friend of Arthur Beverley's, and who had witnessed all that had passed, now ventured to say, "Why, what, in the name of Heaven—!"

"Do not take the name of Heaven in vain, George. I am shocked at your profaneness," said Lady Cornwall, interrupting him. "I am sure, if Lord Gambier was to hear you, you would never be promoted," added her Ladyship, as she left the room.

"You are all bewitched, I believe," said the sailor, "since poor Julia has left you. Why all this nonsensical preparation for that good old lady?"

"Oh!" said Miss Bella, "you know, the horrid old woman is so dreadfully blue, so shockingly prosy, that we should be lost for ever if we were not caught doing something literary or domestic."

"Why, you will all be as bad as old Pampyford," exclaimed the Squire.

"And who is she, Stephen?" demanded the sailor.

"Why the old girl that lives at Pine Apple Grove, with six cats and seven pet spaniels, and they all sleep in four-post beds, and have their hands and faces washed with rose-water. I made a bag of her best tortoise-shell Tom; and she went into mourning because my bull-dog ate him."

The carriage now approached the door, and in a few seconds Lady Roxmere and Lucy were ushered into the drawing-room, amidst the screams and well-feigned exclamation of the whole group. "What?" can it be possible!" exclaimed the hostess,—"Lady Roxmere? dear Lady Roxmere! how delighted I am to see you!—We were just talking of you.—What an age since we have met!—How kind thus to take us by surprise!—How is the dear Earl!—Girls, Bella, Martha, take dear Lady Roxmere's cloak."

"Permit me to present my particular friend, Miss Delmore, who is in future to reside with me," replied the Countess, after the usual salutations.

The young ladies all bowed formally, and whispered among themselves—"Some charity girl, I suppose,—some humble companion: rather cool bringing her here."

"What?" said Lady Cornwall,—"a daughter of that worthy man, Mr. Delmore, of Beverley, of whom we have heard so much?"

"The same," replied the Countess; "he has had the kindness to intrust his treasure to my care."

"So kind of you to take notice of her, my dear Lady Roxmere," whined out the hostess; "so completely in that spirit of Christian benevolence which guides all your actions,—always charitable."

"Always grateful for the obligations I receive," answered Lady Roxmere: "and it is impossible Mr. Delmore could have conferred a greater favour, or given me a more decided proof of his esteem and confidence, than by permitting this dear child to supply the void which is caused by the absence of my poor Arthur.—But I hope," continued the Countess, pressing Lucy's hand, "that she will not find Beverley Castle, or St. James's Square,

quite so dull as they have been of late years. I must now endeavour to rally: I have a daughter to present, for in that light Lord Roxmere and I consider Miss Delmore."

"In a moment Lady Cornwall saw that she was, what her son called, on a wrong cast; and she therefore exclaimed, "How enchanted I am to make her acquaintance! I hope we shall see a great deal of her.—How strikingly handsome!" added she in a half whisper to Lady Roxmere; and then aloud, "Miss Delmore, I must introduce you, individually, to all my daughters. Lucy! what a pretty name! I like it so much, so unaffected.—Here Dora! Bella! Martia! Flora! Miss Delmore;—Miss Delmore, my daughters."

THE HEBREW LANGUAGE.

The Elements of the Hebrew Language. By H. Hurwitz, Author of 'Vindicia Hebraica,' &c. Taylor. London, 1829.

THIS is just such a book as we had a right to expect from the author of 'Vindicia Hebraica.' Without professing much, it completely exhausts the subject to which it is devoted, and supplies the student with an elementary work indeed, but one which will enable him to proceed beyond the elements only, with very diminished labour. It is confined to the removing of those difficulties which especially press upon the unassisted tyro, and which arise from the peculiar construction of the Hebrew words, the changes of vowels, &c; and, by its extreme clearness, it contrasts very strongly with those tedious and involved works which we have hitherto been compelled to wade through at this period of our study. There is surely no time which more imperatively calls for perspicuity, and a lucid method of treatment, than the very beginning of our acquaintance with a language; and, were no other advantages to be derived from the publication of Mr. Hurwitz's 'Elements,' we should feel that all future Hebraists were not slightly indebted to him for smoothing the road so effectually before them at the very outset. That this, and no more than this, has been the author's intention, we are fully assured in his preface. We will, therefore, proceed to show how this has been accomplished. The first chapter is devoted to the manner of writing and reading the Hebrew text, and to the settling the exact value of the consonant and vowel sounds, and describes shortly the origin of the points, and their local value: it also gives some account of 'Sheva,' and 'Dagesh,' which are usually found to be no inconsiderable stumbling-blocks to beginners. We have here also a few remarks on the accentuation of words. These are followed by a Praxis, intended to habituate the learner to the formation of Hebrew letters, and to give him a knowledge of their value.

The second chapter gives rules for ascertaining the power of syllables; gives the force of the *quiescents*, and gives some account of *Mak-keph*, *Metheg*, and *Mappik*. All these are accompanied with plates of numerous examples. Hence he proceeds to the substitutes for *Sh'va* initial, or the semi-vowels, with examples of their use, and that of *Sh'va* and *Dagesh*. After some general remarks on *Kamets* and *Hirik*, on *Holem*, when preceded by *Sin*, or followed by *Shin*, and a table of words, whose only distinction is their vowels, (viz., *LaMoD* לָמוֹד To learn, and *LaMaD* לָמַד He learned. *aL* אֵל God, *eL* אֵל To, and *aL* אֵל not.) He proceeds to the Reading Lessons, selected from 'The Old Testament.' In these the text, as found in the printed copies, is placed at the head of the page, and below, in two columns, its pronunciation in English characters, and its syllabic division in Hebrew, are subjoined. The whole is followed by an analysis of each word. We select one of these as a specimen:

הַשָּׁמַיִם the Heaven. (-) under ה is the

vowel point *Pathak*, (p. 14.) The dot in the ו is *Dagesh hazak*, (p. 33,) which, as it doubles the letter

in which it occurs, makes ו equivalent to וו; the first of which is pronounced with the syllable that precedes it, וַ hash, and the second is pronounced with its own vowel, וּ shū. מָ, is a simple syllable, having the accent. י is pronounced like y in yes; the dot beneath it is short *Hirik*, (p. 14), forming a compound syllable with the ו, thus וַיִּי yim. The accent is on the penultimate, and the whole word is pronounced *Hash-sha-mā-yim*. ׀ is the sign of the article *the*."

By an ingenious device, the words in the subsequent lessons are so printed as to mark distinctly the *prefixes* and *affixes* in each, the word itself being in *dark*, the *affix* in *light*, Hebrew characters; thus, 'And he said וַיֹּאמֶר Vayomer.'

The third chapter is confined to the explanation of accents, of which we may say, in the author's own words, 'Grammarians do not agree concerning either their exact number, names, or powers:' and of which, therefore, he has only given tables which may serve as a sort of assistance to the student on his first meeting with them. This little book concludes with a table of familiar phrases, in which the use of the *pronouns*, and the verb *to be*, is exemplified, as in the case of the *prefixes* and *affixes* by blank letters.

From what we have said, our readers will perceive the exact intention of this work. It is not to supersede a laborious inquiry into the roots of words, or to mechanize the language which, of all others, is least capable of being mechanized, by supplying us with a 'Genesis on the Hamiltonian plan;' it is only meant to facilitate the student's progress over the first steps of his road, by giving him a knowledge of the powers of those signs which he will meet with, and by laying before him the manner in which the government of words affects their appearance. For any thing beyond this, we must look to his 'Etymology and Syntax,' which are to form the second part of the work. Before we quit him, we will mention his own opinion concerning translations from the Hebrew, as a means of acquiring a knowledge of that language.

This little work further contains progressive reading lessons, selected from Scripture, accompanied by a literal translation; not, indeed, as if I wished it to be understood that a critical knowledge of any language, and especially of such a one as the Hebrew, can be obtained by mere literal translations, unaided by grammatical learning, but because I am persuaded that they are, when analytically conducted, the surest means of giving the student a real insight into the use and application of words, and the peculiar idiom of a language.

We would recommend this opinion to the compiler of another work, published by Messrs. Taylor, viz., 'The Book of Genesis, with a literal translation, &c.:' in which we are gravely told to learn by heart the juxta-posed Hebrew and English, till one word does not fail to suggest the other. Now we have always believed, that, in order to obtain the slightest knowledge of Hebrew, it was necessary to track the root through all its derivative words; and we are quite certain, that, in order to derive any mental improvement from any language at all, we must eschew as much as possible the being, what such authors would make us, *word-machines*.

Forest Scenes and Incidents in the Wilds of North America, by George Head, Esq. London, 1829.

THIS is an amusing little narrative of a rather perilous journey, in the depth of winter, from Halifax, across New Brunswick, to Quebec, and from thence to the banks of the Lake Huron, with an account of a residence in that wild spot. The style is plain and unpretending, and there are simple but

* In the first ו a dot is wanting between the two first strokes.

affecting descriptions of the author's cold and weary journey—of the hazardous passage of the half-frozen St. Lawrence—of the great and distant lake—of his rambles in the silent untrodden forest—of the rude yet strongly-marked features of the savage men who wander through that wild domain—and of the grand constructions of its only civilized inhabitant, the beaver.

A New and Complete History of the Counties of Sussex and Surrey. By Thomas Allen, Author of the *History of the Palace and Parish of Lambeth*, &c. Illustrated with Views from Drawings by Nathaniel Whittock. No. 1, 2, & 3. Hinton. London, 1829.

THIS is the commencement of an elaborate topographical work on the two neighbouring counties of Surrey and Sussex, the ancient Saxon kingdom of South Seax. From productions of the kind it would be unreasonable to expect literary matter of great merit, and it will be a sufficient recommendation that the information furnished is ample and correct, and that the illustrations are properly selected and well executed. The first quality, viz. fulness of details, the numbers hitherto published possess in an eminent degree; of the accuracy of those details, it requires more local knowledge than is generally possessed by an individual to judge: but we see no reason to entertain doubts on that head. The illustrations are all from drawings by the same hand of which the masterly View of St. Saviour's in the Borough, by way of Vignette in the Title Page to the first number, cleverly engraved by Rogers, proves the competency to the task committed to it. We are glad to trace the hand of Mr. Rogers in the greater part of the subsequent plates.

Synopsis of Midwifery, shewing the Management of natural and difficult Labours—their Consequences, and Treatment. By Henry Hurry Goodve and Thomas Evans, late house-pupils to Dr. G. Hopkins, Physician, Accoucher to the Wives of Soldiers of the Three Regiments of Foot Guards, to the Westminster and Southwark Lying-in Institutions, Lecturer on Midwifery, &c. Second edition. Highley. 1829.

WE some time back noticed the first edition of this little work, when it appeared in the form of a chart, and have since been happy to find the praise we then bestowed upon it re-echoed by all the Medical journals. It has just been published in the shape of a pocket-book; and 'is made,' say its authors, 'to assume its present form in compliance with the recommendations of the medical journals, and in furtherance of the object which led to its first publication. This object was to give, on a plan of easy reference, advice in cases of emergency; but considering that advice is most needed in the sick room, where a chart would be too ostentatious, and larger books inconvenient, we have determined to give to the young practitioner, in the fewest possible words, the means of directing his ignorance, or of aiding his memory, and in such guise, that whilst he is instructed, his patient shall not be alarmed, nor shall the attendants suspect his occupation.'

The fact, that a second edition has been called for, is a sufficient proof of the estimation in which this little manual is held by the profession; and we should imagine its value would be much increased from the metamorphose it has undergone, from a library chart to a 'Pocket Companion.'

DIALOGUE BETWEEN VARIOUS MEN AND WOMEN UPON VARIOUS SUBJECTS.

AN INTRODUCTORY CHAPTER.

Concerning Tintern Abbey.

If two Englishmen wish to know each other in any worthy sense, that is to say, to become acquainted with each other's whole man, as compounded of vices, virtues, wisdom, folly, agreeables, and disagreeables, there is no way but the old-fashioned one of living for some months or years in the same house, or at any rate, in the same square, street, or village. But there are one or two royal roads to an acquaintance with certain parts of each other's minds and characters. Thus it is too obvious to need remarking, that for the purpose of finding out whatever is perverse, pugnacious, offensive, and outrageous in a friend, nothing is more effectual than a six weeks' tour with him to the Alps, or the Rhine, or the South of France; and I take it to be as unquestionable that the next most advantageous opportunity for studying what may be called a man's outward nature, including his opinions, modes of thinking, artificial peculiarities, and so forth, is afforded by a home tour of half a dozen days;—as there are no custom-houses, no suspected impositions, no uncomfortable inns, no fatigue from wandering three times over half a town, because in asking the name of a street, you may have laid the emphasis on the wrong letters of a word; none, lastly, of the terrible inconvenience which results from being almost entirely dependent upon each others powers of amusement;—there is nothing which can induce two persons to put on an attitude of self-defence, or to restrain them from exposing as much of their characters (except perhaps some little spot which they have a fancy for concealing) as can be exposed in so short a time.

Major Newcombe and Henry Mordaunt, during their short excursion, were able to take many observations of each others altitude and proportions. It would be difficult to say which of them had the advantage in this respect. Mordaunt certainly laboured harder than his companion to disguise his opinions, by assuming a veil of banter, and by various other artifices, to sink his monkish peculiarities. But a young man's attempts of this kind are seldom very successful. His badinage is a thin gauze which can hide nothing from the eye of either man or woman, and his affectations are rather more stiff than that which they were meant to keep out of sight. He might possibly, on this very account, have been less friendly to Major Newcombe than the latter, in spite of his indifference to concealment, was to Mordaunt. But, on the other hand, Mordaunt probably took much more pains to comprehend his friend, than his friend thought it worth while to bestow upon him; for, besides the instinct of reverence we all have towards any one who is more a man of the world than ourselves, he was just at that period of life when the habit of observing and generalizing is strongest.

Mordaunt had seen many old men, and them he fancied that he understood. He thought, (it was a mistake by the way,) but he thought that he could fathom the meaning of all their grave common-places; that he knew what they meant when they laughed at him as a young philosopher, and that it was very natural they should do so. He had no difficulty in explaining why he felt no sympathy with the roaring rabble of a university, called gay men, nor why he was equally at issue with that other class whom he had seen there, who profess an imperturbable quiet, gentleman-like deportment, and are afraid of risking their propriety by the least indulgence in thought, feeling, or humour,—but Major Newcombe was none of these; he was not an old man, and did not talk common-places; he was at the furthest imaginable remove from a roysterer; and he was no mere abstract melancholy gentleman. He talked as freely as Mordaunt, and was not the least afraid to commit himself in a laugh, nay, expressed himself on many topics with enthusiasm and earnestness. He was reflectly unaffected in his manner, and he had no

one quality at all obtrusive or striking,—and though they talked, as I have observed, very volubly, they never argued by any chance, so that if there was any difference of opinion between them it never made its appearance. Why then was Mordaunt so extremely puzzled by his companion, and why was it that, being on such perfectly good terms, he should have made up his mind, after two day's journey together, that they did not feel in accordance upon any one subject? I cannot tell, but so it was.

In this conclusion, however, he was wrong. There were many feelings in common between them; there were points upon which they could have talked and have understood each other perfectly.—They both loved external nature with deep fervent love. And is not this a sufficient attraction—a strong enough point of sympathy between any two characters? If this great door be open, what can prevent the two most dissimilar men in the universe from having free entrance into each other's souls? Alas! it is on this very point that our English lips are most hermetically sealed. It is just on this very subject of natural beauty—the subject on which all our national feelings are most alive, that our national reserve presses most heavily, most cruelly upon us. Nature has spoken to each of us so secretly and solemnly—has so mingled in our most sacred and incommunicable experiences, that we cannot conceive how that which is transfigured, as it were, into our individual being, can be likewise an electrical chain to connect us with the species. No nation ever loved the sea as we love it, except the Greeks, and their sentiment towards it was rather one of happiness and joy—a child-like delight in listening to its manifold roar, and watching the *απείριστον γύλασμα*, than that deep melancholy feeling which possesses our whole soul when we gaze upon it. Delightful it would be if we could share this oppressive pleasure with one another; and yet how often does it happen that two Englishmen approach the sea, and that each is feeding his mind with anticipations of the joy which he shall experience in walking out under a moonless sky when nothing is to be seen but a few scattered lonely stars, nothing heard but the roar of the ocean, and nothing felt but night; and yet that each thinks his neighbour quite unable and unworthy to enter into this sublime passion, or even to understand what it means.

In this respect Mordaunt and his companion were like their countrymen, for neither of them spoke of the effects of scenery upon himself. But though they did not discourse upon scenery like men, they talked of it like artists, and as the language of art in the mouths of all who are not pedants and connoisseurs, is the next best thing to the direct language of feeling, and contains many words and phrases in common with it, these conversations certainly brought them into stricter acquaintance than any other in which they engaged during their tour.

They had sailed down the Wye to Ross, and had fallen into much learned discussion respecting the class of beauty for which this exquisite river is conspicuous, its peculiarly English character, and railed at the monstrous stupidity of the tourists who have pronounced it monotonous, merely because it preserves the same style for many miles, and that a style in which, being rather one of general than of sudden effect, this continuousness, which they call sameness, is eminently requisite. They had talked, I say, in this way, and were now nearly at the extreme point of their tour, as they had reached Tintern.

They were not disappointed with the abbey, as few persons are who have not previously determined to be so. They were prepared to be disgusted with the trick of suddenly throwing open the great door, and the disgust was not quite turned into amusement when two exceedingly fat young women, who, with their grandmother, reached the abbey just at the same time with themselves, took the opportunity of falling into their respective arms in an ineffectual attempt to faint, about a quarter of a

minute before the scene, for which they had prepared their scene, actually made its appearance. But neither this nor any other absurdity of which man or womankind might be guilty, had any effect upon the feelings with which they viewed this magnificent building.

I have heard it said that this abbey does not fulfil our idea of a Gothic temple; that it is altogether too rich and gorgeous; that it is a building which might have been raised by a Greek, by merely adapting the laws of his own art to our climate and circumstances; or at any rate, that it looks rather as if it were raised to the God of nature than to the God of Christianity.

Mordaunt was half inclined to this opinion, and though Major Newcombe dissented from it, he could not help acknowledging that the confessional did not seem to be so absolutely necessary a part of this abbey as of most others which he had visited. But they were both agreed that if the building was an anomaly, it was a most wonderful and glorious anomaly, and one which, at least, compensated for its defection from all outward laws by its perfect internal coherency. How that bright mass of foliage that rises so magnificently behind the eastern window, and flings over the whole chapel a shadow, not dim or gloomy, but rich with the myriad hues that it has received as love tokens from the sunbeams—how this foliage seems to belong to the splendid arch through which you view it! How impossible to conceive their not existing together by some necessary law, some compact sealed between them at the creation! And this character is impressed upon the whole edifice. One would say that it had grown up with the scenery around it, gradually moulding that scene into a new character, and giving an individual meaning to what would have been only a part of the immensity of the universe; and in this view we feel even more in this than in other abbeys, that the Goths, who reduced it to a ruin, were not deviating so far as they supposed, from the spirit of the Goths who built it; for it seems to be fitting, that where a building has so worn itself into a conformity with nature, it should become exposed to all the influences of nature, that the breeze should whistle through its bare window, and the sky look down upon its green pavements.—

The composition of the strange party into which our friends were thrown, we will describe in our next chapter.

THE TEMPTATION.

FROM THE GERMAN OF LA MOTTE FOUQUÉ.

BEFORE the ivied portal of his hall
The aged knight, Sir Hildebrand, was sitting,
Called the Wise Master by the men of Bern.
His heart was glad as he beheld the evening
Sink down so gently on the weary fields,
Amid the solemn sounds from church and convent,
Amid the evening cries of lambs and shepherds,
While streams of smoke rose from the cheerful hamlets.
When suddenly across the peaceful vale
A rapid horsehoof's stroke grows louder, nearing
All up the castle-hill, till dark with foam
A kingly courser halts before the gate;
And a slim youth down-springing from its back
Kneels to the aged warrior, sighing deeply,
In whom Sir Hildebrand soon recognising
His favourite, young Horst, thus speaks to him:
'Wherefore, my boy, thus sad, and thus impetuous?
Hereon these tidings met his anxious ear:
'Father, an evil spirit dwells within me,
And fiercely burning feeds upon my soul.
'Twere well for me, were our dear Saviour yet
Walking on earth, to banish from my heart
The unclean spirit with his hallowing hands.'

HILDEBRAND.

That by his holy spirit doth he still.

HORST.

I then of such high helper am unworthy;
For in a time of fearful need he leaves me.

Two moons have grown and dwindled, since my friend,
Rich Cuno, bade me to his marriage feast.
O my dear good old Master Hildebrand,
Did you e'er see his bride?

HILDEBRAND.

What though I had, my eyesight has grown old.

HORST.

To look on her would make it young again.
And yet at first all went so well with me;
I joyed in her, as in a lovely picture,
The loveliest my eyes e'er gazed upon:
But when Sir Cuno—wherefore did he so?
Led her to be my partner in the dance,
When the warm thrilling pressure of her hand
So fair and soft within my righthand lay,
When my bold arm enclasped her slender waist,
And the eyes of each into the other's lightened,—
Since then I have been lost.

HILDEBRAND.

Hast thou then wronged thy friend?

HORST.

Neither to deed nor word have I given birth.
But what avails it? In my heart the flame
Of my delight and of my woe still burns:
And in my ears a wicked spirit buzzes,
That when I sleep or wake is ever muttering:
Thou huntest oft with Cuno and his wife;
Sharp is thy arrow, thy young courser fleet,
The ramparts of thy castle high and strong—
Oh God, how shall I ever save my soul!

HILDEBRAND.

Strive with the tempter, weary him by prayer.

HORST.

Father, I fear I am become an outcast
From God's dear love and from his saving power.
He, whom such spirits as my tempter visit,
Must surely be a child of hell already,
Forsoaken by the golden choir of angels.

HILDEBRAND.

Not so. But spread thy chest, apraise thy head.
The path whereby our ancient enemy
Rushes against us, lies within his choice;
Our part is on all sides to beat him off.
It is not the temptation which assails us,
But that to which we yield, that makes the sin.
Distrust not then thyself, my boy; far less
Distrust the love of thy almighty Father.
Fight knightfully; o'erthrow thy enemy
However foul he be, it will not soil thee,
If thou but tramplest stoutly on his neck.

The good old Master kissed his darling youth,
And through the vale the knight rode thoughtfully.

Beneath the sunny noontide's deepblue sky
The old Sir Hildebrand upon the morrow
Was walking through the shady alder-grove;
And found there,—with his steed beside him grazing,—
His darling lumbering to a streamlet's song.
The pious Master blessed Almighty God,
Who such rich healing grace was pouring forth
Upon his sleep and dreams.
For free from care the young knight's face was glowing
Amid its golden locks, as bright and fresh
To look upon as any sun in spring.
With gentle tread the master onward passed,
Unwilling to disturb his youthful friend,
And thinking to himself:
In truth thou needest, sorely dost thou need,
For the fierce battles that beset thy life,
Refreshment such as now flows soothing o'er thee.
But scarcely has the thought escaped his mind,
When his long eye-lashes the sleeper raised,
And such a joyous eye beneath them flashed,
As though he were but newly born
And lying in a lovely mother's arm.
Hereat the good old master greatly wondered,
And asked his favorite, whence such gladness came.
Who instantly replied:
'Marvels the gardener at that floweret's smile,
Which he with every loving care has nurtured?'

HILDEBRAND.

Yes, truly 'twas a flower I wished to nurture.
But not like this, not of such dazzling radiance,
As that which unawares before me glitters.

HORST.

Our faithful care is often blest with more,
Than it could ever dare at first to hope for.

HILDEBRAND.

But sprout not too, too quickly, my fair flower.
Tell me, my boy, how feelest thou at heart?

HORST.

Free, glad, and happy, from all fear released:
Thy word has wrought a miracle within me.

HILDEBRAND.

That should it not do. From a man it came,
A poor, frail, sinful man; and if it wrought
A miracle, I cannot but distrust it.

HORST.

What means this fearfulness in such a breast,
So brave, so holy in the sight of God?

HILDEBRAND.

What means the devil in man's breast?
While he dwells there, all fearfulness becometh us.

HORST.

A firm strong will can drive him thence at once:
I willed it, and he fled. Avaunt thou fiend!
God's blessed world now smiles on me all brightness;
I know now that I can do nought but good.
I ate by Cuno's beauteous wife,
Drank from the cup which she before had sipped,
And saw the will of God, and bowed to it.
Now of the battle there's no further question;
The question is, to chaunt the victory.

HILDEBRAND.

When fields are fought, one party needs must vanquish;
But who the vanquisher? must still be asked.
In such things one too readily mistakes:
So to ensure the prize beyond all doubt,
Renew the contest, fight the field again.

HORST.

There is no need of that. Now for the chase.
Cuno awaits me, and his lovely wife.

The good old master for his darling wept,
And through the vale the knight rode joyfully.

But night had not yet fallen upon that vale
When by the stream lay Cuno's bleeding corpse;
And bearing in his arms the ravished bride,
A Cain, unto his castle, galloped Horst.

ON THE EVILS OF THE PRESENT DINNER HOUR OF GENTEEL SOCIETY.

To the Editor of 'The Athenæum.'

SIR,—I am no member of the fashionable world, and consequently know little of its customs. I am not a writer of fashionable novels, or a contributor to 'The Court Journal,' and, therefore, do not pretend to understand the habits of a society in which I do not mix. With persons in a genteel station of life I do, however, occasionally associate; and, as I am, therefore, in some measure incommoded by their bad habits, I have a positive interest in calling their attention to an evil which affects their friends as well as themselves. As the hour of dinner occurs once in the course of every twenty-four hours, the period of the day at which it is generally fixed must be daily interesting to every human bosom. Dinner is the most urgent, the most constant, the most interesting of human employments. Of all points in time the dinner-hour must, therefore, be the most important. And you will not think that I am employing your time with a frivolous discussion, if I proceed to point out the evils which, in my opinion, result from the bad selection of the hour which has been made by genteel society in this country.

I do not write merely for the dyspeptic; I shall, therefore, lay no stress on the supposed unwholesomeness of the present dinner-hour. I propose an alteration, which is demanded, not by the interests of any particular class of the dining world, but by the whole. I am a plain, practical man, who wishes to state some evils which he has experienced, but not a dogmatical theorist, who wants to force every one else to adopt his speculative opinions.

The London season occupies April, May, June, and July, months containing altogether a number of

very hot days. Now, according to the present system, we ride and walk in the most sultry part of the day, and come into our hot dining-rooms just when the external heat begins to be least oppressive. We go toiling and stewing through the streets at a time when the human animal is capable of no greater fatigue than that of eating; we sit down to a meal of eternal duration just when the coolness of the evening invites us to walk abroad: so that we manage to subject ourselves to all the inconveniences, and lose entirely all the most delightful part of a summer day. If we began dinner at four, it would be possible to get out again in the evening; we might, perhaps, be content with two hours of dinner, and adjourn to the Park or Kensington Gardens. Such an evening would be indeed a second day.

It would be no slight addition to the advantages of a change in the hour, that in all probability the prospect of the evening's amusement would make people eat their dinner a little faster. When they begin that meal at seven or eight, (indeed it is more proper to say eight,) the day is over for all purposes. The blessed light of the sun is excluded: the hot glare of candles or lamps is substituted for the sweet beams of sunset; and down sit the Britons, like boar-constrictors, to eat and drink their fill. Hence, I believe, the heaviness of their cookery; hence the tremendous time which they devote to eating; and hence the much greater waste of time spent in drink than in their detestable port, over which they drone out their equally detestable politics. Let it only be the custom to go out after dinner, which of course it would be if you dined at four, and people would not be able, or would be ashamed, to make the beef and bottle an excuse for a deviation from a fashionable amusement.

Of course if you dined at four, you must eat again before bed-time. This would bring back the supper, which from all accounts was a very pleasant meal. Supper and dinner combined would be much less unwholesome than the dinner which is eaten at the present time.

Putting aside, however, my semi-rural ideas of a walk or drive after dinner, how much the evening amusements of every kind would be improved by dining at an earlier hour! It would then be the custom to dine out, and after dinner go to the opera or the play. Now you might as well attempt to dine at two different places at once, as go to a dinner-party and the play the same evening. When an English lady determines to go to the play, she fixes a day, which may happen to be vacant about a fortnight before, for which she takes her box, and on which she must go, though she may be gratified with the anticipation of seeing and hearing whatever she may least wish to see and hear. A party is made: the dinner ordered at five, and the whole establishment *desorienté* to prepare for so unusual a precession of domestic hours. Let the usual dinner-hour be four, and the dinner engagements would no longer interfere with the theatre. You might go whenever you fancied that the entertainments would be good, without the least regard to dinner-engagements, because you might keep them before. You would not change your hour, but merely add one to the other amusements of the day. This, it seems to me would, in all likelihood, produce a great improvement in our stage. The theatre would again become an amusement to the higher orders: and the drama would be adapted to their taste; which, after all, is better than that of the prostitutes, apprentices, and lawyers, for whose taste our theatrical amusements are now chiefly designed.

Though the opera is an amusement much more patronized by the higher classes, their hour of dinner interferes terribly with their enjoyment of it. How, for instance, can people who have a dinner engagement, be present at the overture, which is the finest part of many operas? At the moment that the overture begins, they are beginning their dinner; and it is as much as they can do to get in time for the commencement of the second act. Those who wish to hear an opera through must disorganize their do-

mestic arrangements, and refuse invitations to dinner, almost as much as those who wish to see a play.

Last of all, in the career of an evening's amusement, come routs and balls. Even these feel the fatal influence of the protracted dinner hour. When people rarely get up from the dinner-table before half-past ten, it is utterly impossible to be at an evening party before eleven: and I think I do not at all exaggerate when I say that eleven is the very earliest hour at which people can go to any of these assemblies. Now, this is just the time that they ought to be going away. Instead of this, they stay up dancing, or squeezing in hot rooms, till two or three in the morning, (I take the earliest hours,) to the great damage of the health and beauty of young ladies, and the equal destruction of the corporeal and intellectual vigour of the men. Hot rooms and late hours are the main causes of the sad mortality and ugliness prevalent among young women of fashion: and both these evils are clearly remediable by the adoption of an earlier dinner hour.

I know that it is objected, that we are a nation so occupied in matters of important business, that we cannot regulate our hours without reference to the hours of business. Merchants, lawyers, and men in office, cannot leave their work before four or five o'clock: how then can they get home to dinner as early as I propose?

The simple answer is, that if the alteration of the dinner hour were general, the hours of business would undergo an adequate change. People would go to work at nine instead of ten, and come away an hour earlier. Besides, our present hours exclude a great number of people from dining out at all. Peers, for instance, and members of parliament, are often rather important elements of a dinner party. But dinner begins just at the time that all the most important debates begin; and a member is consequently obliged to give up one or other of these two interesting gratifications of the jaw. I appeal to the civilized world, whether it is not a matter of the greatest difficulty to ensure a member's attendance at the dinner table on any days but Wednesday and Saturday. I fearlessly appeal to all impartial and observant persons, whether they have not constantly observed two or three chairs at the same dinner left as empty as their own heads by members who have been suddenly obliged to yield to the more pressing invitations of Mr. Planta or Mr. Holmes; and thus occasioning a greater vacancy than would have been exhibited even in the countenances of the senatorial absentees.

I speak these things with all the gravity and regret due to the subject. If any importance is to be attached to the ancient institutions of a nation, surely the hour at which we observe the most useful, and the most universal of rites, is worthy of our deepest consideration. Dinner, an enjoyment common to all nations of men, is the great universal act in which the mystery of a common faith is dimly shadowed forth;* and the desire of dinner is the great common sympathy which binds together the various descendants of Adam from the rude native of Australia to the great models of civilization, where a wiser people bath sent forth to communicate to that poor savage, the arts of polished life. If then there is one national institution, the spirit of which is to be carefully cherished, surely this is that one. Let us in this, as in other matters of the same kind, look carefully to the hidden meaning of the establishments of our ancestors. In the better days of England, our forefathers were wont to dine early. As we have deteriorated as a nation, we have procrastinated our dinner. The victors of Cressy and Agincourt dined at noon. No later hour witnessed the meal of the conquerors of Troy. The progress of luxury and its concomitant vices has kept pace with the progress of the dinner-hour: and the total subversion of the natural arrangements of our time, has, in

my opinion, been no trifling cause of the present utter subversion of our morals, our natural feeling, and our constitution. Your's,

'A DINER-OUT.'

MELITA.

A FRAGMENT OF GREEK ROMANCE.
(Concluded from p. 398.)

The girl was startled amid her adoration by a voice appearing to come from beyond the portico, and singing the words of the hymn, snatches of which had been uttered by the poet in her father's house the day before. She thought, but could not be sure, that she recognized the same tones pronouncing the enthusiastic poetry of the ode which she had heard under such different circumstances; and they blended themselves strangely with her own fearful ecstasy at the presence of the king of heaven. When this ode had been sung by one low but earnest voice, a single strophe of a different style and manner was vociferated in thundering music by the whole company of priests and uovices. Scared by this overpowering sound, Melita shrunk among the officiating train, and looked at the crowd of worshippers collected before the temple. She thought she recognized her father; and trembling and uncertain, she glided away, and, when she had gained the solitary wood, ran with all her speed through thickets of trees and groups of glimmering statues, which she feared were living pursuers; till wearied and agitated, she reached her humble home. Her father speedily returned, but she had already changed her dress; and as soon as she had saluted him she retired to her chamber.

When she had thrown herself on her couch she began to meditate on the occurrences of the last few hours. The heat of the oracular prediction; the poet, with earnest tones, faint indeed and broken, but of exquisite sweetness; the distant sounds of the multitude congregated around the stadium; the long procession of priests and worshippers, with the garlands and the incense; the green twilight of the consecrated grove, and the white gleam of those unmoving marble champions; all these were present to her mind; but chiefly the murmuring stillness of the vast temple, with the wavering flashes from the tripods, cutting the evening gloom, and over all the form of which the ivory limbs were wrapt in a golden shadow, the noblest exhibition of deified humanity, the king, the god, the beautiful, the one master of her soul, Jupiter, the wonder of Greece and glory of the earth, filled, overawed, agitated, and attracted her.

The deep dark night was around her, and she had remained for an hour absorbed in these contemplations, when suddenly a bright blaze stared at once from the walls, the floor, and ceiling of the chamber, and covered them as if with a fiery drape. It gave out no heat, but flamed with a steady and topaz-like lustre. Melita gazed in astonishment at the wondrous light, which did not however scare her with any resemblance of an earthly conflagration. It burned for a few seconds, and when she had, in some degree, overcome her first alarm by perceiving the innocence of the lights, innumerable snakes of the most different colours appeared to move and float along the walls, and to play in the lucid blaze. Green and white, black and crimson, blue, purple, and orange, starred with jewels, and streaked like the tulip, they wove together in that liquid illumination a thousand knots and momentary devices. Arching themselves like the rainbow, or in ranks like some gorgeous oriental cavalry, they moved from the sides of the chamber to the ceiling, or twined themselves around the simple furniture.

The serpents appeared to melt and mingle into each other, and were swallowed by the general splendour; and the burning boundaries of the room widened and receded till they resembled the atmosphere of an evening sky, filled with the richest and

most sparkling clouds; and amid these, as if disclosed from the burning disk of the sun, a large bird, of as brilliant plumage as the fabled Phoenix, flew forward, and passed before her. But soon it appeared to change its shape and lose its glory, and became a gigantic owl with round bright eyes. The evening prospect darkened into night: the white crescent of the moon stood over the shaded hills; and the grey bird perched on a rock which overhung the sea. The new moon in that world of witchery appeared to rise at nightfall, and for a moment she watched its silent ascension. A faint musical sound caused her to look away, and on the rock where she had seen the owl alight, the young poet was now leaning; the sea glimmered at his feet, one arm rested on a projection of the crag, and his eyes were turned as her's had been to the diamond curve that adorned the darkness of the sky. She fancied that in his countenance she discovered a resemblance to the pale and majestic loveliness of that statue of Jupiter, which to her was far more than a statue. Clouds came over the heavens, and obscured the view. The youth was no longer visible, but a dull twilight covered the foreground, and through this two small red stars were burning. She looked at them intently, and shuddered at discerning the form of a gigantic lion crouched, as it seemed, at a little distance from her, and watching her with the glowing eyes which had first drawn her attention to the object. He seemed to grow nearer and nearer to her; and the whole picture had soon disappeared, leaving nothing but the shaggy monster and the dim and narrow room. The lion rose, and with a light bound, laid himself on the bed before her feet. The enormous shape became less terrible when she was within its reach; and while her foot appeared to touch its flank, and its mane lay spread on part of the mantle which, in her terror, she had let fall from around her, she thought that it was no more than an enormous and threatening shadow.

When the chaotic dimness of the chamber was dispersing into the clear transparency of a summer night, Melita remembered the tales she had heard of Proteus and his wonders; and the bewilderment of her mind had little of terror or suffering. The desert-shape which shared her couch, rolled away amid the mist which now vanished from the room. Its fiery eye-balls seemed gradually to recede till they were lost among the throng of stars that twinkled in the cloudless firmament. Wild troops of birds and insects fluttered around her; and trains of children, whose whispers were like distant tinklings, moved hither and thither, bearing baskets of flowers. A pink light gradually spread through the air; and one of the children detached itself from the playful ring of its companions and approached her. In that carnation splendour, every thing was hidden but the gentle, smiling boy, who seemed to walk on the charmed wind. His delighted eyes were fixed laughingly on her; and in another instant she had stretched her hands, and he was pressed to her uncovered bosom. She laid her head on the pillow, and he nestled in her arms, while she gazed with eager pleasure on the sunny locks that clustered round the brow of the infant, and trained to her side his round and rosy limbs.

Both countenance assumed a deeper meaning, and she trembled with emotion when it seemed to her that the lines of that baby loveliness became stronger and more expressive, that the eye darkened and spoke earnestly to her's, and that the lips were pressed with more than childish passion on her quivering youth; when she thought that in this young visitor she could recognise at every moment a nearer likeness to the island poet. But soon this resemblance too escaped from her; the forehead became more purely, the features nobler and more radiant; the gleam of a golden cloak thrown off, was spread out; his finely proportioned limbs; and now for the first time she perceived, among the dark brown hair, the slender olive wreath, and in all the form and look the well-remembered presence of the olymp god.

* 'The mystery of faith set forth in the act of eating'—Irving's Sermons.

On the next morning, when the father of Melita was leaving his house, he informed his daughter that the young stranger whom they had aided, was in that day to be crowned as the successful poet. Scarcely had he departed, when, seized with an impetuous frenzy, she rushed away to the place at which the festival was held. The poet had not appeared, and the prize was given to the second of the competitors. But it was a deadly crime in any woman to approach the spot; and Melita, before the eyes of all the people, and of her white-haired father, was precipitated from a rock into the river Alpheus, such being the punishment appointed from of old, for her offence. 'Heavily, O, my daughter!' said the aged man; 'have the maxims of the wise and the prediction of the oracle, been fulfilled in thee?'

ROYAL COLLEGE OF PHYSICIANS.

THE Tenth Conversazione of the College was held on Thursday last, being the concluding meeting of the season. Sir Henry Hallford, the president, on taking the chair, said he had received, from the Secretary of State for the Colonial Department, certain reports on the subject of the recent epidemic fever at Gibraltar. A *précis* of these reports was then read by Dr. M'Michael, the registrar; by which it appeared, that in the autumn of last year it was thought advisable to appoint a committee of medical practitioners and others at Gibraltar, to inquire into the nature and probable causes of the epidemic which had then recently visited that town. The result of their investigations was; 1st.—That the disorder was of the kind usually called 'yellow fever,' and not the bilious remittent fever, common to certain situations in warm climates, during the autumn, nor any other disorder arising from the stagnation of stagnant waters; imperfect drainage of streets, or suspended ventilation; for during the whole time that Gibraltar suffered by this calamity, there occurred scarcely any cases of the autumnal malaria fever, even at the season when such affections might have been expected. 2dly.—That the disorder did not originate in Gibraltar, but was brought there by a ship from the Havannah, on board which several of the crew had died of the yellow fever, before leaving the Havannah, and others on the passage. The towns on the African coast, in the vicinity of the Straits, were not afflicted by any sickness, and a cordon was established by the Spanish authorities, which effectually prevented the fever from spreading in Andalusia. A committee was subsequently appointed to inquire whether persons who have once been attacked by the yellow fever are again liable to that disorder, and their report stated that, though some very few cases of a second attack were recorded, yet it was their opinion that persons who have once had the yellow fever will not take it again, a case to the contrary being quite as rare an occurrence as a second attack of small-pox after inoculation.

The gentlemen to whom the latter investigation was intrusted, had seen or attended between 20,000 and 30,000 cases of yellow fever in the course of their practice and residence in several countries; and the opinion thus pronounced by men of such great experience will, it is hoped, produce a beneficial effect, and procure to the individuals labouring under that dreadful malady, the humane attentions of those who have hitherto been too often tempted to desert, through the fear of infection, the unhappy sufferer.

On the table of the library was a beautiful and interesting collection of nearly all the plants in the *Materia Medica*, many of them in bloom, presented by Mr. Iliff, to whom the thanks of the College were expressed by the President. There were also some curious skeletons of serpents, and one of an ostrich, with a variety of anatomical and chemical preparations. These, and many valuable books from the library, formed a brilliant ensemble, well

calculated to elicit conversation on scientific subjects, and thus promote the chief object of such meetings.

THE HORTICULTURAL FETE.

WE never saw an assemblage of English people, (that is, a well-dressed one,) in such good spirits, and so determined to be cheerful, as that collected at the Horticultural Gardens on Saturday. We are a proud nation, all the world knows, and, among other peculiarities which this gives rise to, always show a particular horror of appearing to be controlled by circumstances, seldom willing to be merry when there is a good occasion; nevertheless, on the slightest appearance of circumstances decidedly opposed to that consummation, we set about enjoying ourselves with a vehemence beyond conception. It was singularly fortunate, therefore, that on Saturday the weather was as bad as it could possibly be, the rain falling without interruption from morning till night; not a single gleam of sunshine to cast a cloud over the festivities of the day. The strict solemnity of feature so observable in the crowds who promenade in Hyde Park, or at Kensington, on a fine Sunday, seemed, on this occasion, to be put completely out of countenance by the superior gloominess of the sky; and, though our hearts bled profusely to see the sad pickle some of our fair friends were in, we felt hugely comforted to find their spirits in a better state of preservation than their stockings—not dashed, in fact, at all. No doubt, the good-humoured attention and affectionate gallantry, to which the weather gave opportunity, on the part of the gentlemen, amply compensated to both sexes the disturbance of apparel which none escaped, and the loss of a ceremonious quadrille upon the greensward. In every direction, gentlemen, heedless of the reputation of their boots, were seen hurrying on some benevolent excursion, to cheer the ladies in the tents with the anticipation of a pie, or to rejoice the fair bacchanals with a bunch of grapes and a bottle of champagne. These expeditions, however, though extremely pleasant in the collection, were almost too perilous at the time, and sometimes even awful in their consequences, by reason of the muddiness of the walks, and the distance of the marquees from each other. Many a one, whom we saw go forth, 'like a spirit,' as the poet says, 'rejoicing in his task of glory and of good,' came back immediately, like Noah's dove, despairing from the world of waters. We remarked, in particular, the fate of one gentleman, whose white trousers, shining with the unsullied purity of Sabbath table-linen, seemed to have recommended him to a group of good-natured smiling creatures as a suitable victim of self-devotion,—the greatest virtue doubtless of which our sex is capable. They accordingly demanded tea at his hands. With a mournful and almost desponding smile of alacrity in his countenance, he left the tent; we saw him ankle-deep in an instant; he struggled forward to a considerable distance; but, we shudder in saying, that he never returned. The greatest evil, however, which the weather occasioned, was the want of movement in the company; there was no passing in review, no parading, and every one was thrown on his own circle and his own resources for entertainment, except when some fair one passed, dripping and lovely, like Venus from the ocean; or some very wise man indeed, muffled in a great coat, walked contemptuously by, smiling on the folly of his fellow-creatures. The immense circulation of those excellent papers, 'The Morning Post,' 'The Observer,' and 'The Times,' make it quite unnecessary for us to praise the style of Gunter's preparations, or the excellence of Weippert's band. The feathered tribes of nature were mute; their hilarity, poor creatures! seems to depend too much upon the weather; but they were admirably represented by those outlandish birds, 'Les Trois Troubadours,' who sang to us like angels, and smiled for all the world like brass knockers. About nine o'clock we left, as we came, in excellent spirits and a shower of rain.

THE DRAMA.

King's Theatre.

MR. LAPORTE is one of those sagacious individuals who, on setting foot in a foreign country, have the wisdom to conform to the habits and manners of the people whom they visit. All eyes and ears, like Zucchero's portrait of glorious Queen Bess, the Intrapresario of the London Opera has not failed to learn that Monsieur Jean Bull, with his opulence and his liberality to boot, is a stickler for justice, and will have his due. Spending freely what he acquires, the said Monsieur Jean, does not regard prices (and what other country in the world could have furnished such constant throngs of payers of fifteen shillings and half-guineas as have filled the King's Theatre to overflowing, during the whole season!), but he looks for a *quid pro quo*, and expects, moreover, that his money's worth shall have a palpable as well as an essential equivalent: quantity, in short, is fully as necessary to his satisfaction as quality. Several recent bills of fare prove that our French physicians have felt the pulse of their English patients, and certainly the most straightened amateur of music, however he may regret that the choice is not left him of having less and paying less, could find no cause to complain of the price of the entertainment of Saturday last. A little half-crown for each act of the 'Cenerentola' executed by Sontag, Donzelli, and Zuchelli, he surely would not begrudge; to see and hear Malibran in the last act of 'Romeo et Julietta,' he would allow to be a treat, at any time, well worth the sixth part of an old guinea; and surely those who disburse without murmuring, their one shilling and sixpence to behold, for a few minutes, two rude and grotesque stone figures of half-seas-over boors, could not with reason object that the elegant little ballet, the 'Déguisemens Imprévus,' with its beautiful scenery, and with the variety of exquisite grouping of such models as Leroux, Rinaldi, Péan, and Coulou, was too highly estimated at a pair of twelve-penny pieces. Let there be included in the account, moreover, the value of the opportunity of combining profit with pleasure—of taking lessons in various arts and accomplishments, and that in a way far more likely to make an impression on susceptible natures, than all the private teaching in the world; and it must be granted, we think, that the performance at the opera, regarded, in a commercial point of view, is not a dear article.

We throw out these suggestions for the benefit of the deserving, and unfortunate few, in whom a taste for elegance is subjected to the mortification of ill-furnished coffers, as hints how much may be done in the way of affording themselves the recreations most congenial to their spirit, by husbanding their means. Let them leave all gaping wonders to the affluent and the merely curious, and reserve their half-crowns and shillings for a treat to the King's Theatre. We could wish, indeed, that art in all its branches were unsubjected to these paltry considerations: but, alas! the day when that consummation shall arrive, will never, we fear, be beheld by mortal eyes—not even in New Harmony! Let us seek consolation then in reflections on the operatic performances of Saturday.

Sontag and Donzelli, in the 'Cenerentola,' acquitted themselves with the accustomed effect and brilliancy. The former has scarcely, on any occasion, afforded higher gratification than by the admirable style in which she executed her part in the sextett 'Questo è un nodo,' and the air, 'Nacqui all' affanno.' Accordingly, the rapture of the applause which rewarded her efforts, has seldom been exceeded.

The true *con amore* feeling and energy with which the rich and powerful tones of Donzelli were poured forth, and by which he appealed to the spiritual faculties of his audience, by awakening in them a fervour corresponding with his own—while he charmed their senses by the deliciousness of his voice, had its full effect in exciting the liveliest emotions. Zuchelli also executed the many diffi-

cult parts which fell to his share in this opera, with his accustomed skill.

The novelty of the evening was the substitution of Galli for Pellegrini, in the character of Dandini. The change cannot be pronounced a happy one. The voice of Galli may be more fresh and vigorous than that of Pellegrini, but it wants the flexibility required by the singer who undertakes this part. The performance, moreover, was merely organic, wholly devoid of humour and character, either in the execution of the music or in the manner of the acting.

'The Cenerentola,' as has been already intimated, was succeeded by a repetition of the last act of 'Romeo e Giulietta.' This really test scene afforded an opportunity to Madame Malibran to display her excellence in both arts, and she approved herself indeed a most accomplished person. Less sublime and majestic in character, it must be allowed, than Pasta, and less capable of elevating the mind to lofty sentiment, yet she showed herself endowed with powers of a more various nature; and in her scenes of tenderness she combines intensity of feeling with correctness of expression in a degree in which she is not surpassed by any living actor or actress. In her singing she has not the astonishing manner of Sontag, but her excellence takes a more varied and extensive range. The execution of the former is as the painting of the Flemish masters, which captivates the sense through which the mind is addressed, by the brilliant *bouquet* effect of the colouring; that of the latter may be compared to the paintings of the Roman school, which affect their beholder more by the sentiment they express, and the mind and skill to be traced in the combinations by means of which that expression is produced, than by the brightness of the hues, through the medium of which the conceptions of the artist are sought to be imparted. Sontag's performances are, as verse, full of melody; Malibran's, as compositions, rich in mind and imagery. This contrast in the styles of these highly-gifted singers was strongly thrust on the attention by the performances of Saturday night. Sontag's Cenerentola has been already noticed: the Romeo of Malibran on this, as on the former occasion, to which we barely alluded last week, was a noble display of taste, feeling, and execution, both in music and acting; the part afforded a fine opportunity for the development of the peculiar excellence and beauty of her lower notes, and the advantageous occasion was not neglected.

We cannot exactly comprehend what our cotemporary the 'Times' means by praising Sontag's performance of Giulietta, this evening. We perfectly agree with him in the truth of the general proposition that, 'the part of Giulietta is particularly suited to the style of Mademoiselle Sontag;' but we cannot agree with him so entirely as to the fact with which it is coupled, that Sontag appeared in that part on Saturday evening. That our cotemporary should be guilty of abusing Madame Malibran, for a performance which he did not witness, appears incredible to persons who know his high character for integrity; but it is strange that he should have taken Castelli for the divine Sontag. The latter beautiful songstress will, no doubt, feel highly flattered at finding that her vocal and personal charms bear so great a resemblance to those of our cotemporary's favourite singer. We fear that the public may possibly think that the ears and eyes which cannot distinguish Sontag from Castelli, are not the best evidence on which to convict Madame Malibran of bad singing and worse acting.

The elegant little ballet, 'Les Déguisemens Imprévus,' was repeated. Two all-accomplished young ladies, Mathilde, (Mademoiselle P. Leroux), and Madame Walter, (Mademoiselle Péan), left in a château, disguise themselves as peasants, in order to share the pleasures of a neighbouring fête. Scarcely are they departed when papa (Baron d'Herman) returns with his young friend Rosemberg, (Coulon), the destined spouse of Mathilde. Informed of the occasion of the absence, and of the travestie, the lover, who has not yet been introduced to his mistress, also

assumes the costume of a countryman, and repairs to the festival. He, of course, meets with Mathilde, and woos her in peasant style, by dancing, kiss-stealing, and other modes peculiar to the happy races of swains and ballet-dancers. In the course of these proceedings there is some exquisite dancing and grouping, such as a first-rate artist might delight in studying, by P. Leroux, Péan, and Coulon. A party of gypsies is introduced, and this affords the opportunity for a wonderful display of Terpsichorean acquirements, by Madame Rinaldi, as Lazarilla, 'la première Bohémienne.' Some niceties in her performance excited more than usual admiration, and bore away the palm for the evening. The costumes are picturesque, and, in general, true; but, to be complete, the blue stockings of the peasantry should have the enlivening broad white clocks so common among the Tyrolese.

ROYAL ACADEMY EXHIBITION.

(Concluded from p. 363.)

THE ANTE ROOM.

Who has climbed the abrupt steps of the Exhibition staircase on his first visit after each periodical opening, without feeling persuaded that the Seers of the Royal Academy, with all their decorum and sedate demeanour when they appear before the world in body politic and corporate, have yet some lurking humour in their souls? Who—like the Alpine traveller toiling up the steep ascent and pausing breathless ere the wished-for summit be yet attained, to cast his regards around him, and anticipate in his eagerness the prospect that awaits him,—does not admire and smile when, on looking upwards, curious to get an early glance at the treasures of art that adorn the well-covered walls, he finds his view encountered by the well-selected master-piece which the judicious Ketch of the exhibition, with tact and taste, unvarying from year to year, and with the approbation, of course, of the higher powers, never fails to suspend over the entrance of the great sanctuary? Who would think of turning in despair and running headlong downwards, when invited to proceed by the sight of such a performance as No. 374, 'The Portraits of the Family of Nathan Knight, Esq. Pendleton House, Lancashire.' J. Green? How graceful the eldest Miss Knight! What ease of attitude! How original the grouping of the more infant darlings! Do they not look like very zephyrs in petticoats, bearing a cherub Cupid? What pity, that when once we are well advanced into the Ante Room, the vertebrae are too inflexible for the tortuous effort, and 'The Pendleton Family' are seen no more. Alas, for Mr. Green, that it should be more convenient to contemplate less elevated objects, and that such pictures as 380, 'View near Chalons sur Saône,' C. Stanfield, should fix the partial attention of every visitor;—not that this picture is undeserving of the notice it receives; it is a delightful composition, full of picturesque effect, and of a most agreeable tone of colour.

It has a neighbour worthy of its vicinity, in 397, 'Distant View of Winchester; a Shower passing off,' Copley Fielding.

'The Guerrillas Departure,' No. 403, D. Wilkie, is not inferior to the other productions of this artist, which we found so much cause to applaud in our earlier notices of the Exhibition. The composition is delightful and simple; the picture is illustrative of what, among a haughty people like ourselves, would be deemed a striking peculiarity in Spanish manners; it is certainly highly characteristic. The figure of the beggar-boy calls Murrillo to mind; it is well introduced, and by its nudity gives great effect to the abundant drapery which clothes the man devoted to religion and charity. The contrast, indeed, is a speaking satire on the world in general, and on the clerical predominance in Spain more especially. The head of the monk is fine, full of life and intellectual expression.

'An Italian Scene,' J. Severn, No. 404, is another delightful picture, the result of the aptitude with which the English artists catch the spirit and senti-

ment of foreign scenes. The feeling and taste displayed in this production are truly charming; they are eminently classical, and remind us of the times when chivalry, poetry, and love, were the soul of fruitful Italy; when the lady of the castle beguiled the long absence of her lord by superintending the labours of her female peasantry, less her vassals than her companions; the confidantes of her love and truth; the witnesses of her vows for the glory and safety of their chief; the delighted listeners to the oft-repeated but never wearying strains, the favourite air of the far-distant cavalier.

'The Chevalier Bayard and his noble Hostesses of Brescia,' No. 421, J. W. Wright. An interesting incident in the life of this model of generosity and magnanimity for soldiers and gentlemen, the Scipio of the sixteenth century, is here represented in a very pleasing and elegant picture. The grouping of the ladies is charming and full of grace; the artist seems to have been singularly happy in his models, in the choice of which he has displayed rare tact, and taste only equalled by his skill in arranging them for his composition.

'View on the Wye, Welch Bicknor Church in the distance,' F. W. Watts, No. 433, is a lovely landscape, painted with great effect, picturesque in composition, and delightful in tone and sentiment. Sir Thomas Lawrence's 'Portrait of Mr. Locke, Sen.' No. 455, is a masterpiece of its kind. 'The Portrait of Dr. Bowring,' by Mr. Pickersgill, and that of Mr. Farraday, in 'The School of Painting,' which we have hitherto omitted to mention, are capital likenesses. 'The Table Bay, the Cape of Good Hope,' R. Pickersgill, No. 478, is a very richly painted seapiece, and an interesting scene.

THE ANTIQUE ACADEMY is a subject for despair. We confess we have never yet accomplished the wading through the catalogue of the gems, gems no doubt they are, with which the corners of this room are set. There is 'M^r. Robert Montgomery,' as large and poetical as life, with his hair most tastefully parted, to display the beautiful polish of his forehead. We looked around for Mr. Dewille, but he was not there. Doing so, a drawing of Chalon's caught our eye, so, from that moment to this, when we retrace the Catalogue, we have thought no more of the author of 'Omnipresence' or his portrait. Of all Mr. Chalon's clever elegant drawings, that which charmed us most, was 'The Portrait of Mrs. Dumaresq'; there is a sweet and pensive melancholy in the expression of this countenance that is most touching. Who can look at the drawing without hoping that the sentiment is the result of over anxiety and an excess of sensibility, rather than of any actual cause for sorrow. 'The Venetian Gondolier,' No. 532, J. F. Lewis, is an admirable sketch. Of 'The Portrait of Mr. Scoles,' 496, Mr. Hollins, a clever drawing, in Eastern attire, may we not say, 'How like a Turk!' As for 'Major Von Der Rogerie zu Pfefferkorn,' we recommend Mr. Warren to be cautious in future how he makes so grave a work as the 'Catalogue of the Royal Academy Exhibition' the vehicle of his jests.

THE LIBRARY, as usual, abounds in splendid designs of impracticable architecture. The drawings of Mr. Soane, notwithstanding the humility of their dedications, must be ranked in this class. Could any thing be more absurd than 'The design to complete the north front of Westminster Hall, by making the exterior of the new Law Courts and a corresponding wing in the same style of architecture as the northern entrance into that venerable structure, part of the ancient Royal Palace?' We may, however, select a few designs, which deserve to be excepted from the general censure. 'The west View of Costessy Hall, Norfolk, the Seat of Lord Stafford,' J. C. Buckler, —We rejoice to find that this beautiful picturesque composition is in the progress of execution. It is a very clever design, full of movement and variety, and in good style. It is also very finely drawn.

'Design for a Nobleman's Mansion,' H. Parke, No. 1021, is a magnificent, without being an extravagant idea for a palace, in the neighbourhood of a mountainous country. The character of the architecture is noble, grand, and princely; the outline has

a rich and pleasing variety. The drawing is in that excellent and effective style in which the designs of Mr. Parke ever come recommended to public attention.

'The View of the College of St. David's at Llanpeter,' No. 1031, C. R. Cockerell, is charming both as an architectural design and as a clever drawing, and displays a profound study of English architecture. In the sections of the National Monument of Scotland, of the model and of the dimensions of the Parthenon, Mr. Cockerell shows himself as well versed in Greek architecture as in the former design he appears learned in that of his native country. These are charming drawings: the wreaths in the frieze, however, must be objected to as common-place ornaments. The mode in which light is admitted, without injury to the exterior effect of the Temple, is highly ingenious. The preservation of the full depth of the steps is also a feature much to be commended in this design.

The 'Design for an addition to the Portico of the late Carlton House, so as to form it into a temple, in the manner of the ancients,' No. 997, P. F. Robinson, reminds us of that beautiful monument of antiquity, the Maison Carrée, at Nîmes; and excites a regret that an application so simple and so accordant with the character of the elegant columns which composed the late portico has not been adopted.

There are many other designs which are well deserving of more particular notice, did our space allow us to enlarge on their merits. We regret to be obliged to content ourselves with merely referring to the several splendid and beautifully drawn designs of Sir J. Wyattville; 'The Cambridge Town Gaol,' of Mr. Brookes, No. 1098, a good adaptation of the Tudor style; and a clever 'Design for the Interior of a West End of a College at Oxford, No. 1118, W. Bardwell.

The Model Academy is more rich than usual, in figures of merit. Mr. Chantrey's 'Statue of Sir Edward Hyde East,' to be erected in the Court House, Calcutta, No. 1198, is altogether a grand performance; the head is admirably executed. Mr. Westmacott's two statues, the one sitting, the other standing, a Brahmin and a Mussulman Moulah, for the Monument to Warren Hastings, are also noble figures, well conducted in respect to design, full of character and general sentiment, and finely executed.

'The Cupid' statue, in marble, by Gibson, 1199, comes nearer to the true thing, and to what sculpture ought to be, than any other production in this room. The idea is elevated and full of poetry; the form is exquisite, pure, and in antique style, while the flesh has a roundness and an apparent softness very rare in works of modern execution.

'The Girl with a Fawn,' No. 1200, R. Westmacott, Jun. is a very pleasing group; but for the sentiment we prefer the pretty little figure of the 'Reaper,' by the same artist, No. 1139.

To Mr. Rossi's Musidora and Mr. Chantrey's bas-reliefs, we must hold up the finger and cry 'Fi! Fi!' The exhibition of the latter more especially is surprising. That Mr. Chantrey should have attempted to execute a classical subject in bas-relief is quite natural; and that he should fail in the effort is quite natural also; but that an artist of his eminence and experience should be so blinded by love for his own offspring, as not to perceive that these are mere common-place productions, quite unworthy of a man of his reputation, is strange indeed, and makes us feel for the infirmities of human greatness. If he be pardoned at all, it must be in grace to his 'Bust of the Marquis of Stafford,' which is admirable.

'The Boy and Tortoise,' in marble, R. W. Sievier, 1219, is exceedingly facetious. But we owe Mr. Sievier a grudge for obliging us to quit a sculpture-room with a feeling of the ridiculous.

In taking leave of the Exhibition, we cannot refrain from expressing our apprehension that it may be many years ere we visit another so creditable to the country.

ENGRAVINGS.

Hanoverian and Saxon Scenery, from Drawings by Captain Batty. Part XI. Jennings. London. 1829.

Of the five views which compose this number, the two last, which are those of 'The Exchange, Copenhagen,' and a second view of the 'Palace, Fredericksborg,' are the most interesting. The other three, which are agreeable landscapes, (Ilseberg, Karlshafen, and Hoxter on the Weser,) are sufficiently picturesque to make pleasing plates, but have no peculiar features so strikingly remarkable as to deserve notice in detail. The view of 'The Copenhagen Exchange' on the contrary, with its numerous gables and lofty twisted spire, is a very curious specimen of characteristic architecture, and, with the quay and boats in the foreground, forms an effective picture. It is very well engraved by Kernott. The entrance view of the palace, Fredericksborg, of the architecture of Sir W. Jones, is a curious medley of styles, producing altogether a grand and very picturesque combination. Here we find anticipated the idea of Mr. Nash of the cupolas with pointed terminations with which he has adorned Sussex Place. The drawings and engravings, the latter by Freebairn, are executed with great precision and accuracy.

FRENCH READINGS.

SINCE the publication of our last week's Number, we have had the satisfaction of hearing Mr. P. Victor read the two first acts of his own tragedy, 'Les Scandinaves'—the two first acts only, we are obliged to confess: for, however much regret it caused us to appear rude, or to seem to undervalue the labours of Mr. Victor, the going through the reading of a whole tragedy at one sitting, at an hour of the day when all the world is on the *pavé*, was requiring too much from people of business. To the unsuitableness of the hour, therefore, less than to any inherent want of interest in Mr. Victor's 'Lectures Dramatiques,' we are inclined to attribute the scanty audience, by which the declamations of the poet-actor were frequented. Mr. P. Victor has the air of a sensible man, and he read with great correctness, and a very considerable degree of feeling, well deserving of more encouragement than he seems to have received.

We have heard much commendation bestowed on the manner of reading, and teaching pronunciation, by Mr. Roy, whose ambition has an aim somewhat less lofty than that of Mr. Victor. He is content to seek his hearers and pupils on the very verge of the eastern and western boundary; and proposes to give a course of French Readings, to commence on the 2nd July, at the London Mechanic's Institution, and to be delivered at eight o'clock in the evening. The better to enable his readers to profit by his instructions, Mr. Roy publishes, as a preparation to his lectures, editions, in French and English, of the subject matter of his readings. Proposing to commence with the *Avare* of Molière, he has put forth that play in French and English in a small pocket volume; in which, to facilitate the acquisition of correct pronunciation, the *e* is marked with a peculiar orthoëpic sign in those instances, in which it is feebly, or almost imperceptibly, pronounced, without being absolutely mute, like the *e* final.

UNIVERSITY OF OXFORD PRIZE SUBJECTS.

THE subjects proposed for the Chancellor's prizes for the ensuing year are the following:—

For Latin verse.—*Tyrrus*—for such members of the University, who, on the day appointed for sending the exercises to the registrar of the University, shall not have exceeded four years from the time of their matriculation.

* Pickering, Chancery-lane.

For an English Essay.—*The Character of Socrates* as described by his disciples, Xenophon and Plato, under the different points of view in which it is contemplated by each of them.

For a Latin Essay.—*An apud Græcos, aut apud Romanos magis exulta fuerit civilis Scientia.*—These two subjects are for those who from the time of their matriculation have exceeded four, but not completed seven years.

The subject proposed for Sir Roger Newdegate's Prize for English Verse, is—*The African Desert*—for any under-graduate who at the day appointed for sending in the exercises, shall not have exceeded four years.

No person who has already obtained a prize will be deemed entitled to a second prize of the same description.

The exercises are all to be sent in under a sealed cover, to the registrar of the University, on or before the first of May next. The author is required to conceal his name, and to distinguish his composition by a motto; sending, at the same time, his name and the date of his matriculation sealed up under another cover, with the motto inscribed upon it.

CAMBRIDGE UNIVERSITY PRIZES.

Sir William Browne's three Medals for the present year have been awarded as follows:

Greek Ode.—*Νῆσος Ἀστυλὴ ὅρας ἰὺ ἀλὶ νῆστα-
ουσι.*—Charles Rann Kennedy, Trinity College.

Latin Ode.—*Cæsar, consecutus cohortes ad Rubi-
conem flumen, qui provincia ejus finis erat, paulum
constitit.*—Charles Merivale, St. John's College.

Greek Epigram.—*οὐδὸς διδοῦς.*—Charles Merivale.

Latin Epigram.—*Splendide mendas.*—Charles Merivale.

Members' Prizes—fifteen guineas each, for the encouragement of Latin prose composition:—*An putandum sit posthac fore ut gentes Meridionales sub Septentrionalium viribus iterum succumbant?*—George Langshaw, St. John's College.

Under-Graduates.—No prize adjudged.

KING OF BAVARIA AND ENGLISH ARTISTS AT ROME.—That magnificent and amiable patron of arts, the King of Bavaria, paid marked attention to our countrymen who are cultivating the Fine Arts at Rome, during his last visit to the scene of those intellectual pleasures from which no royal personage ever derived more great and unfeigned delight than this prince. He invited several of them to dinner, and on that occasion Gibson had the honour of sitting on the right hand of his Majesty and Severn on the left.

INFLATION OF THE LUNGS OF NEWLY-BORN INFANTS.—At a late sitting of the French Academy of Sciences, M. Julia Fontenelle stated a curious fact in confirmation of the usefulness of the practice of inflating the lungs of newly-born children, apparently lifeless. An infant, born in a state of asphyxia, was brought, said the speaker, for dissection, to M. Portal: it had already lain some time in the room, and the surgeon was about to commence the anatomy; but before proceeding to operate, the thought occurred to him to blow into its mouth. This he accordingly did, and at the end of two or three minutes, warmth returned, the circulation was excited, the heart beat, and the body was sent back to the parents—a living child.

ENGLISH PERIODICAL AT DRESDEN.—The publication of a new English periodical at Dresden was commenced in April last. It bears the title of *The Garland*, and is composed of articles from the reviews, magazines, literary journals, annuals, and new works, in English, with miscellaneous information in all branches of modern literature, inventions, discoveries, biographical memoirs of eminent persons, short tales, and poetry. The price of subscription is four dollars a year—12s. 6d.

TO THE EDITOR OF 'THE ATHENÆUM.'

SIR,—The writer of the article in 'The Athenæum,' headed 'Mr. Brougham's Education Bill,' deserves praise for his wish to facilitate the general education of the lower classes of society. But the means are to be carefully examined by which he would accomplish that desirable object. It was because Mr. Brougham had not duly estimated them, that his bill was not carried into effect. It is admitted, that the circumstances of this country are materially changed since the plan was first introduced. The inquiry remains—are they so changed as to authorize its renewal? The writer of the article supposes an opposition would be made by Dissenters. This would probably be the case. But it would not be from Dissenters alone. The friends of civil and religious liberty in general would be hostile to the measure, if the plan be the same as was before brought forward. Nay, as the principles of liberality are better understood and more extended, the objectors to the bill would be increased. The clergy have already enough of power in their respective parishes. To add to this, the choice of a schoolmaster, who must be a churchman, and appointed only by the clergyman, aided by a select vestry, or a fox-hunting esquire, is not a scheme calculated to secure harmony in a parish, if disputes existed, or where they are liable to occur, or a diversity of political sentiments may prevail. The persons who would feel the oppression the greatest are those who are now most engaged in promoting education; such as the teachers in Sunday schools, and the advocates for schools for all. The article contains a proposition which is inadmissible:—that because the State pretends to supply the spiritual wants of the people, therefore it ought to provide for their mental wants. What has been the effect of that pretension? Does the provision, however ample, that is made for the clergy, supply the wants of the nation? The Church and State are not one. North America has shown that an ecclesiastical establishment is not necessary for the promotion of general knowledge, the increase of morality, and the spread of religion. Individual conviction of the duty has been found adequate to attain these most desirable ends. Nor has a diversity of opinion promoted discord, or subjected one sect to maintain another which might be more highly favoured. The State is not a competent judge of the best mode of supplying the spiritual wants of any nation. All history confirms this fact. Ecclesiastical history is full of the evils which have resulted from governments presuming to dictate what faith their subjects should espouse. It was the dread of such consequences that occasioned the alarm when Mr. Brougham's bill was announced. Many of the clergy also objected to it because of the greater labour that would be imposed upon themselves.

Had Mr. Brougham proposed that government should erect rooms in every parish, and that the parishioners should have the choice of their own master; had the same freedom been allowed in communicating religious instruction which is granted in the British and foreign schools; had visitors been appointed, with salaries, to report the progress of the scholars, and to call those masters to account who had neglected their duty; had this been the principle on which Mr. Brougham's bill was framed, he would justly have been entitled to the support and gratitude of his countrymen. On former occasions, his watchful eye could easily discern the danger of giving power which might be employed in lording it over God's heritage; in his writings he had often exhibited the mischiefs of parochial contests; and hence the sorrow of his friends when they considered him deserting his principles, and the triumph of his enemies, who accused him of courting the clergy and strengthening aristocratical influence. Unless, therefore, the enactments of Mr. Brougham's Education Bill be radically changed; unless the masters be chosen, not from one favoured sect, not because of any creed they may adopt, but because of their moral and intellectual fitness for the office they are to fill; unless a general interest be excited to carry into effect the measure he proposes, an increase of opposition to its adoption will be called forth. No one is more able to serve the cause of liberality, none more capable of diffusing useful knowledge; upon himself, therefore, it will depend whether he will be the benefactor to the ignorant, and join the hands and hearts of the friends who wish

general instruction to be imparted to the lower classes of society, or whether he would wish his bill to remain in its present state—a *caput mortuum*.

BOOKS PUBLISHED DURING THE WEEK.

Dagley's Birth Day, and other Poems, 4s.
Legends of Einsidlin, by the Rev. W. Liddiard, post 8vo., 8s. 6d.
Italian Tales, and other Poems, by P. Browne, Esq., post 8vo., 7s. 6d.

Saturn's ditto ditto 3° 53' in Leo.
Sun's ditto ditto 7° 23' in Cancer.
Sun above the horizon on Sunday, 16h. 39m. Day decreased 2m. No real night.
Sun's horary motion on Sunday, 2' 23" plus. Logarithmic num. of distance, .007221.

This day is published, in one thick volume, 8vo. price 18s. in boards.

THE FRENCH LIBRARIAN; or, LITERARY GUIDE. Pointing out the best works of the principal Writers of France, in every branch of Literature, with Personal Anecdotes and Biographical Notices, preceded by a Sketch of the Progress of FRENCH LITERATURE. By L. T. VENTOUILLAC.

To make French Literature more generally known, to obtain for it a higher degree of estimation in England than it has hitherto enjoyed, by making both the extent and the value of its stores more familiar to the English public, is the object of the present work, the result of some years' research, and application. The more fully to obtain this end, a list in each branch of literature is given of every work (within the author's knowledge), which may be considered deserving of attention. Where various editions of the work are known, the best is pointed out, and the merit of the work itself is established, not upon the author's own opinion, but upon that of the most eminent writers of France and of England; and that a still greater degree of confidence might be obtained for the critical dictum thus introduced to the English reader, although the French criticisms have been translated into English, a reference is always given to the volume and page of every work whence remarks have been taken, so that the reader may not only ascertain their correctness, but, where it may seem desirable to him, say, by turning to the original work, find a full criticism of the work in question. In addition to these critical marks, personal and literary anecdotes have been introduced, partly to do away with the appearance of a mere catalogue, and partly because these anecdotes, by making the character of the authors more fully known, tend to throw additional light on the nature and merit of their works. This book, it is hoped, will be found a full compendium of French Literature, and Indexes, on an enlarged and improved plan, are added to give every possible facility for reference, and thus render the work more generally useful.

Published by Treuttel & Wurtz, Treuttellun., and Richter, 30, Soho-square. Of whom may be had, the following valuable works, published during the present season:

I. PORTUGAL ILLUSTRATED. By the Rev. W. M. KINSEY, B.D., Fellow of Trinity College, Oxford, and Chaplain to the Right Hon. Lord Auckland.

Embellished with a Map, Plates of Coins, Vignettes, and various Engravings of Costumes, Landscape, Scenery, &c. Second Edition, with Large Additional Matter, and several New Embellishments. Handsomely printed in imperial 8vo. Price Two Guineas, in boards.

II. HISTORY OF THE WAR IN THE PENINSULA UNDER NAPOLEON; to which is prefixed, a View of the Political and Military State of the four Belligerent Powers. By General Foy. Translated from the French. Second Edition, handsomely printed in 2 vols. 8vo. with a Portrait. Price 24s. boards.

III. HISTORY OF RUSSIA, AND OF PETER THE GREAT. By General Count PHILIP DE SEGUIER. Author of the "History of Napoleon's Expedition to Russia." Handsomely printed in 1 vol. 8vo. Price 10s. 6d. boards; also, in French, Price 8s.

IV. A HEBREW LEXICON TO THE BOOKS OF THE OLD TESTAMENT; including the Geographical Names and Chaldaic Words in Daniel, Ezra, &c. By Dr. WILHELM GESSENIUS, Doctor and Professor of Theology at the University of Halle. Translated from the German, by CHRISTOPHER LEO, formerly Teacher of Hebrew and German in the University of Cambridge, late Professor of German at the Royal Military College, Sandhurst, &c. &c. Handsomely printed at the Cambridge University Press, in 2 vols. 4to. Price 2l. 14s. boards. The second volume may be had separately, Price 30s.

V. A NEW DICTIONARY, ITALIAN-ENGLISH-FRENCH, ENGLISH-ITALIAN-FRENCH, AND FRENCH-ITALIAN-ENGLISH. By S. E. PETRONI and J. DAVENPORT. Third Edition, Corrected and Improved. In Two thick Volumes, 8vo. Price 2l. 2s. (reduced from 2l. 10s.)

VI. HISTORIC SURVEY OF GERMAN POETRY, interspersed with various Translations. By W. TAYLOR, of Norwich. Vols. I. and II. handsomely printed in 8vo. Price Fifteen shillings each, in boards. Vol. III. is in the Press, and will complete the Work.

VII. GERMAN POETICAL ANTHOLOGY, containing Selections from 119 Poets, with Notes for the use of Students; preceded by a Historical Sketch of German Poetry, a List of distinguished Writers, and short Critical Notices of the Authors selected, intended to assist the lovers of German Literature in their choice of poetical works. By A. BERNAYS. Dedicated, (by permission) to the Right Hon. Earl Talbot. Handsomely printed in one Volume, 12mo. Price 8s. 6d.

VIII. WENDEBORN'S PRACTICAL GERMAN GRAMMAR, in which each rule is systematically, clearly, and concisely explained, and immediately followed by proper Exercises, for the use of English Students of the German Language. Eighth Edition, considerably enlarged and Improved by D. BOILEAU. In 12mo., price 8s. bound.

IX. A COMPREHENSIVE GRAMMAR OF THE GERMAN LANGUAGE, on a New Plan, Condensed in Two Synoptical Tables. By W. KLAUERTATTOVSKY, Professor of the German and Northern Languages and Literature in London. On two Folio Sheets, price 6s., or in a Case, price 7s.

X. GERMAN AND ENGLISH DIALOGUES; or, Easy Introduction to the German Language. By J. F. REYMANN. In 12mo., price 7s. boards, or 7s. 6d. bound.

XI. ICONES FILICUM: FIGURES and DESCRIPTIONS OF FERNS, principally of such as have been altogether unnoticed by Botanists, or as have not yet been correctly figured. By WILLIAM JACKSON HOOKER, L.L.D. Regius Professor of Botany in the University of Glasgow, and Fellow of the Royal Antiquarian, and Linnean Societies of London; and ROBERT KAYE GREVILLE, L.L.D. Fellow of the Royal and Antiquarian Societies of Edinburgh, and of the Linnean Society of London. Fasciculus I.—VII., handsomely printed in Folio, price 1l. 5s. each, plain; or 2l. 2s. each, coloured. Fasciculus VIII. will be published on the 1st of September next. This work will be included in 12 fasciculi, each consisting of twenty plates, accompanied with as many leaves of description, to appear quarterly. The descriptions are written entirely in Latin, and a few remarks added in English; the plates are executed with the greatest attention to accuracy, and in the best style of the art, especially in the dissections of the fructification, from drawings made by the authors. A List of Subscribers will be printed in the last Number.

XII. FOREIGN QUARTERLY REVIEW. No. VI. Contents:—1. Arts and Manufactures in France.—2. Humboldt's Political and Statistical Account of Cuba.—3. Meyer on the Judicial Institutions of the Principal Countries of Europe.—4. Oginsky's Memoirs on Poland.—5. Derode's New Theory of Harmony.—6. Memoirs of Vidocq.—7. Raumer's History of the Hohenstauffens.—8. Louis Bonaparte's Answer to Sir W. Scott's History of Napoleon.—9. Language and Literature of Friesland.—10. Duke Bessarion's Travels in North America.—11. Wine Trade of France.—12. CRITICAL SKETCHES. French Works.—12. Cousin, Cours de Philosophie.—13. Musée de Peinture et de Sculpture.—14. Histoire de l'Ecole Polytechnique.—15. Biographie Universelle Ancienne et Moderne.—16. Bausset, Memoires Anecdotes

tiques, Tom. III. et IV.—17. Almanachs Français pour 1820. *Italian Works*.—18. Gamba Serie di Testi.—19. La Fidanza Ligure. *German Works*.—20. Botticher's Geschichte der Carthago, nach Quellen.—21. Falkmeyer's Geschichte des Kaiserthums von Trapezunt.—22. German Almanachs for 1820.—Eighty-two Miscellaneous Literary Notices from Denmark, France, Germany, Italy, Netherlands, Russia and Poland, Sweden, Switzerland, and concerning Oriental Literature.—A List of four hundred and sixty-nine of the principal New Works published on the Continent, from September to December, 1820.

Number VII. Contents:—1. Sismondi's History of France.—2. Language and Literature of Holland.—3. Ancient National Poetry of Spain.—4. Scandinavian Mythology.—5. French Criminal Trials.—6. Mexico.—7. Victor Hugo's Poems and Novels.—8. Von Hammer's History of the Ottoman Empire.—9. Foreign Views of the Catholic Question.—CRITICAL SKETCHES.—10. Coquerel's History of English Literature.—11. Dr. Munster's Account of a MS. of St. John's Gospel.—12. Peletier's Treatise on Heat.—13. Martinez de la Rosa's Works.—14. Guerrazzi's Battle of Benevento, an Historical Romance.—15. Annuaire of the Board of Longitude for 1820; M. Arago's Notice of the Steam-Engine.—Ninety-three Miscellaneous Literary Notices, from Denmark, France, Germany, Italy, Netherlands, Russia and Poland, Spain and Portugal, Sweden, Switzerland, and relative to Oriental Literature.—A List of three hundred and thirteen of the principal New Works published on the Continent from January to March, 1820. Price Seven Shillings and Sixpence each Number.

No. VIII. will be Published in July.

WEDGWOOD'S MANIFOLD WRITERS

produce a letter and its copy, or a letter, copy, and duplicate, all at once, with one pen, which is not liable to get out of order, or require feeding like the common pens, and, on account of its cheapness, portability, and despatch, has met with universal approval and commendation. Sold, wholesale, retail, and for exportation, at the manufactory, 4, Rathbone-place, London: and by Mr. Farthing, Mr. Lund, Messrs. Smith and Elder, and Messrs. Piddling and Co., all of Cornhill; Messrs. Roake and Varty, 31, Strand; and by all respectable booksellers throughout the kingdom.

From the Royal Institution, London:—

Mr. Ralph Wedgwood having, in confidence, exhibited to us his Pocket Secretary and Everlasting Pen (now called the Patent Manifold Writer), for the sanction of our opinion, we have the satisfaction to state, that we have made trial of the same, and in their recommendation have to observe, that we consider the invention worthy of public attention. He hath likewise made known to us the Principle of the Ink made use of in this invention, which from our knowledge of its nature, we have reason to assure the public, may be used with great advantage, as it is not susceptible of those changes which common inks undergo, thereby frequently rendering valuable writings illegible, to the great loss and disappointment of individuals and society.

HUMPHRY DAVY.
CHAS. HATCHETT.

From the Royal Observatory, Greenwich:—

I hereby certify, that the paper prepared by Mr. Wedgwood, for Manifold Writing, has been very advantageously employed for registering the Greenwich Observations, since the year 1818 to the present time.

J. POND.

Royal Observatory, Greenwich, May 15, 1820.

IMPROVED TERRO-METALLIC TEETH.

MR. H. HOWARD, 52, Fleet-street, (removed from 33,) having brought to perfection an important improvement in TERRO-METALLIC TEETH, respectfully solicits the attention of the Nobility and Gentry to his new method, which he is confident will be found on investigation to be far superior in natural appearance and durability to any ever before produced in England. They perfectly restore the articulation and mastication, and are not to be distinguished in any respect from the original teeth.—52, Fleet-street. At home from 10 till 4.

TERRO-METALLIC TEETH.

MR. A. JONES, Surgeon-Dentist, 43, New Bond-street, begs to acquaint the Nobility and Gentry, that, from many years' intense application, he has invented and brought to perfection, a New System of Fixing TERRO-METALLIC, NATURAL, and ARTIFICIAL TEETH, from one to a complete Set, which are so accurately fitted as not to be distinguished from the original, and answer all the purposes of mastication, articulation, &c.—Mr. A. J. continues stopping decayed teeth with his unrivalled Anodyne Cement, which in one minute allays the most excruciating pain; and by this means carious teeth are wholly preserved and rendered useful, even if broken close to the gums. This being a metallic composition, it becomes hard as enamel in a few minutes, will not decompose with the heat of the stomach, and resists the effects of acids, atmospheric air, &c.—Cleaning, and every operation incidental to Dental Surgery.—At home from ten till five.

Under the Superintendence of the Society for the Diffusion of Useful Knowledge.

On the 1st of July was published, price 2s., THE MENAGERIES, Part II.; being the Third Part of the Library of Entertaining Knowledge.

London: Charles Knight, Pall-Mall East.

MR. LA BEAUME'S PUBLICATIONS.

CASES OF THE SUCCESSFUL TREATMENT OF DYSPPEPSIA, OR INDIGESTION, and other Ailments occasioned by a disordered state of the Nervous System and of the Digestive Organs.—Asthmatic, Cutaneous, and Glandular Complaints; the Diseases peculiar to Males and Females; Deafness, Blindness, Lameness, &c. Price 3s.

OBSERVATIONS ON THE REMEDIAL POWERS OF THE AIR-PUMP VAPOUR-BATH, on the Cure of Gout, Rheumatism, Palsy, Diseases of the Skin and of the Joints, &c. Price 6s.

REMARKS ON THE HISTORY, PHILOSOPHY, and MEDICAL EFFICACY OF ELECTRICITY, in Nervous and Chronic Diseases; with numerous Cases and Copper-plate Engravings. Price 16s.

* All these Works have been most favourably noticed in the Medical and other Reviews.

INTERNAL FIRE OF THE EARTH.

THE FIRST NUMBER OF THE THIRD VOLUME OF THE EXTRACTOR, will be published next SATURDAY, Price only 6d. This Number, amongst other interesting matter, will contain an important article on the Internal Fire of the Earth, establishing a New Theory of the Globe, in which will be introduced consideration on Volcanos and their connection with the present and past history of our Planet, &c. Office of Publication, 150, Fleet-street.

Part VIII., for July, Price 2s. is published this day. The Second Volume of The Extractor, Price 9s. 6d.

WESTMINSTER REVIEW.

THE WESTMINSTER REVIEW, No. 21, was published on the 30th of June, containing the following Articles:—1. Corn Laws.—2. Life and Writings of P. L. Courier.—3. Living Poets of Hungary.—4. Last of the Plantagenets.—5. Cobbett's Corn.—6. Discoveries in the Interior of Africa.—7. The Village Patriarch.—8. Physiology of Trees and Ornamental Planting.—9. Modern Italy.—10. Civil Government of Canada.—11. Vidocq's Memoirs.—12. I. Taylor's Translation of Herodotus.—13. Southey's Colloquies on the Progress and Prospects of Society.—14. Anne of Geierstein.—15. Historical Records of the Peruvian Indians.—16. Greatest Happiness principle, and the Edinburgh Review.

No. 22 will be published on the 30th September, and will contain articles on the East India Free Trade, the West India Question, Legislation for Gaming Houses, Newspapers, &c.

The CATECHISM OF THE CORN LAWS (6th Edition), quoted with high praise in both Houses of Parliament, may be had at the Office, and from all the Agents of the Westminster Review. Price 6d. Office of the Westminster Review, No. 2, Wellington-street, Strand.

FOR ELDERLY AND DEBILITATED SUBJECTS.

This day is published, price 3s. Third Edition, with Cases, A PRACTICAL TREATISE ON THE PROPER DIET, EXERCISE, &c. &c. of Elderly People, and of those who were born weakly, or who have brought on, by indulgences or abuses, general or local Debility, or in whom symptoms of breaking up of the System appear;—as Dropsical Swelling of the Legs, general Nervousness. With Directions for Regulation of the Bowels, and the Use of the round-leaf Cornel, when a tonic is necessary. To which are added, an account of the Chiraya herb, a remedy for Nervous Indigestion, and of the Jobelia inflata herb, with instructions for its use in Spasmodic Asthma. By J. H. ROBINSON, M.D. of St. Croix.

'We have no hesitation in saying, that weakly and nervous subjects will derive more valuable information from this work, than all the volumes that have been published on let. It is clearly the production of a physician of experience, who has paid particular attention to the subjects it embraces. It is, in these times of book-making, *vera ars a multum in parvo*, of a practitioner who is desirous to communicate information of real practical utility. What a contrast does this pamphlet afford to the "Sure Methods of Preserving Health, and other contemptible works, which have been puff'd off by the editors of religious, or rather irreligious books, who are totally ignorant of the subject."—*Monthly Gazette of Practical Medicine*, Feb. 1820.

'Feel its uniform grateful and strengthening effects on the stomach, I consider the round leaf Cornel the natural tonic of man, and the stomachic comforter of old age.'—Professor Ives, in the *American Medical Journal*, June, 1820.

SCULPTURE.

TAM O'SHANTER and SOUTER* JOHNNY. —These Statues, illustrative of Scottish Character, Costume, and the Poetry of Burns—Scotland's immortal Bard—executed by the self-taught Artist, Mr. THOM, are now exhibiting at 28, Old Bond-street. Since their arrival in town, (23d April,) they have been visited by upwards of 10,000 persons, all of whom have expressed their admiration of them as works of art.—Admission, 1s.; Books with Observations, 6d.

* Cobler.

EXHIBITION OF DRAWINGS, by J. M. W. TURNER, Esq., R.A., consisting of VIEWS IN ENGLAND AND WALES, executed for a Work now in course of Publication, at the Large Gallery, Egyptian Hall, Piccadilly.

Admission, by Tickets only, which may be obtained (gratis) of the publisher, Mr. Jennings, 2, Poultry, and 325, Oxford-street. Open from Ten till Six.

Subscriber's names received at the Gallery.

Just published, a Print of

SUNDAY MORNING—THE TOILET. The Sabbath bells have ceased—and yet she lingers To take a last, last look.

Engraved by J. ROMNEY, from the Original Picture painted by R. Farrier, Esq., in the possession of E. Woods, Esq.—Prints, 10s. 6d.; Proofs, 16s.; India Proofs, 21s.; twenty-five taken before the letters, 31s. 6d.

Published by R. Ackermann and Co., Strand; Moon, Boys, and Graves, Pall-Mall; and J. Romney, 13, Clarendon-square; of whom may be had,

WEBSTER'S 'REBELS—SHOOTING AND DEFEATED'; and LANCE'S 'DEAD PHEASANT'; engraved by Romney.

MINERALS, FOSSILS, SHELLS, AND CRYSTALS, FOREIGN AND ENGLISH.

COLLECTORS and Dealers are respectfully informed, that they will find the prices moderate, and a large Collection of NEW and RARE SPECIMENS, the property of a late eminent Author, for immediate sale by Mr. Walker, in his large Room, Upper Gallery, Western Exchange, 10, Old Bond-street.—To the Gentry desirous of promoting the pursuit of Natural Philosophy, by presents to Museums, Institutions, and the Scientific, this is a rich banquet of intellectual delight.

This day is published, in 1 vol. 8vo., with twenty Plates, price 11s. plain; 30s. coloured.

FLORAL EMBLEMS. By HENRY PATTERSON, F.L.S., and F.H.S., Author of 'Pannarium Britannicum' &c. Containing the Art of Combining and Arranging the most beautiful and intelligible Emblematical Devices, and of Secret Correspondences.

'By all those token-flowers that tell

What words can never speak so well.'—*Spectator*.

Printed for Saunders and Otley, Public Library, Conduit-street.

PORTRAIT OF HIS MOST GRACIOUS MAJESTY THE KING.

In a few days will be published, by Subscription, A Most admirable PORTRAIT of his MAJESTY in the ROBES of the GARTER, from the Original Picture by Sir Thomas Lawrence, P.R.A., Principal Painter in Ordinary to his Majesty.

This Print, an extraordinary *chef-d'œuvre* of engraving, executed in Mezzotinto on Steel, by Mr. Hodgkiss, is from the magnificent picture presented by his Majesty to the City of Dublin: it represents his Majesty at a most favourable period, and it is scarcely possible to imagine a work of art more characteristic of dignity and splendour of personal appearance, or more worthy of being handed down to posterity as an Historical Portrait of the King.

To Subscribers the price will be as follows:

Prints	£2 12 6
Proofs	4 4 0
India Proofs	5 5 0
First Proofs before the letters	7 7 0

A Book to receive Names of Subscribers, to whom the Impressions will be delivered in the order of insertion, is open at the publisher's, Mr. Colnaghi, No. 23, Cockspur-street, Charing-cross, where the Engraving may be seen. Names are also received at the Exhibition of the Royal Hibernian Academy; at the Pelican Office, Abbey-street; and by Messrs. Allen, Dame-street, Dublin; and by the principal Book and Printsellers in the United Kingdom.

* Repetitions of this very favourite Portrait have in like manner been transmitted to the principal Crowned Heads, to His Majesty's Ambassadors, to Governors General, to the University of Oxford, and to the late Pope; it may, consequently, be considered the Official and most approved Portrait of our Sovereign.

London: Printed and Published every Wednesday Morning, by F. C. WESTLEY, 145, Strand, opposite Newcastle-street.

No. 89.

LONDON, WEDNESDAY, JULY 8, 1829.

Price 8d.

THE SUBLIME AND THE RIDICULOUS.

A DIALOGUE.

A.—WHAT was the subject of conversation between you and Wharton, when I interrupted you the other day?

B.—Do not laugh if I tell you—the Character of Napoleon?

A.—I should be the last person to laugh at a confession of such singular honesty. And so Wharton, who spends half his time in studying the teeth of questions, to discover whether they are not too old for service, actually discussed one which is marked stale, in the *index expurgatorius* of every country coterie?

B.—He waives his scruples about the antiquity of a question, which will serve as a peg for some spick and span paradox.

A.—What is the latest which he has suspended upon it?

B.—He asserts that Napoleon ought not to be called a Conqueror, so long as that title is also given to Alexander and Cæsar.

A.—His exquisite reason?

B.—He says that 'Conquest,' in the modern feudal sense, is synonymous with 'Acquisition,' and that, in the heroic and classical times, no two meanings could be at a wider distance from each other than those which are denoted by these two words.

A.—Well?

B.—That Alexander was a classical Conqueror; Napoleon a feudal one; and that we are constantly losing our sense of this difference.

A.—What name does he propose to substitute?

B.—He would call Alexander the *Vanquisher*, or else Napoleon the *Acquisitor*.—The first would be the most correct, because the word Conquest, of right belongs to modern times, but the latter would be most useful in curing the confusion in our notions, because it gives the meaning to one name which we have hitherto tacitly given to both.

A.—A mere refinement, I think?

B.—Nevertheless, Acquisitiveness, as the phrenologists speak, was actually a much more remarkable characteristic of Napoleon than of Alexander or Cæsar. How strikingly we discover it in his sayings.

A.—In his sayings? I do not understand you.

B.—Have you never remarked the very great poverty and feebleness of all the best-known thoughts and phrases which are attributed to Napoleon—setting them in such strong contrast with the life and originality of Cæsar's, for instance.

A.—And to what do you attribute it?

B.—To the circumstance that the thoughts of the one have grown from slips, the other from roots. Whence it happens that Napoleon's look withered and sickly the moment they are taken out of their native soil, and that Cæsar's, into whatever country they may have been transplanted, are as healthy and vigorous now as they were eighteen hundred years ago.

A.—Illustrate your meaning by an instance.

B.—Suppose we take the hackneyed one. 'From the sublime to the ridiculous there is but a step.'

A.—Are you sure that is Napoleon's?

B.—The question every one naturally asks; but there is no reason to dispute his property in it, any more than to deny that he was once possessor of

Holland, Italy, and Spain. The thought is his, so far as mere Acquisition, as our friend would say, can make any thing any man's.

A.—I am again at a loss. If the title be one which will stand against an adverse claim, what signifies it whether it be of descent, purchase, or occupancy?

B.—In spiritual properties the difference is considerable. In every country you will find some honey-suckles and dog-roses, hemlock and nightshade, in the hedge-rows, which every one has a right to appropriate who pleases, but which only children care to appropriate, because almost all, save children, value the beauty of the landscape above the pleasure of possession. Now in this description of flowers or weeds, must be reckoned the saying of which we are speaking. Napoleon did not sow it, nor till the ground which was to bear it; he merely plucked it. There it was in the fields amidst a thousand others, which shoot up by thousands, every year, from the light sandy soil of France, adding something to the general appearance of the country, and sometimes noticed individually in the books of our herbalists, but never gathered till some child, or some one who has carried the childish lust of 'Acquisition' into manhood, chances to pass by. Napoleon kept it in water, and displayed it, many years after, at St. Helena, to the admiring eyes of Mr. Barry O'Meara.

A.—By what criterion do you determine that the sentiment is French?

B.—The thickness of the outer leaves, and a total deficiency of heart are infallible proofs.

A.—I wish you would not resort to those metaphorical expressions. What do you mean by 'outer leaves,' and 'heart'?

B.—If you have leisure we will examine the sentiment, by which means you will perhaps understand me better. Does it not strike you that there are a great many instances which seem at once to establish its truth?

A.—A great many; and it is the recollection of them which makes me wonder that you should express so contemptuous an opinion of it. For instance, nearly all the fine speeches, apostrophes, appeals to Jupiter, Mars, the shade of Henri Quatre; and, above all, the death scenes of the heroes of the French Revolution, strike me as dwelling on the border land.

B.—Very well; do you remember any others?

A.—The others which occur to me are different, and serve to furnish another sort of evidence in its support. They are such as the conversation between the Fool and Lear; parts of the trial scene of Fergus M'Ilvor; the grave digger's scene; and innumerable others, in which the ludicrous is made subservient to the sublime, and increases its effect.

B.—Your double set of instances are weighty; and thus you may comprehend the first part of my sentence respecting this saying, of Napoleon's; so far as it can derive strength from outward observations: which are to a sentiment what the sun and rain are to a plant; so far it is strong—and hence I was induced to say that it was thick in its outer leaves. Now let us look at the sentiment in itself; let us see whether it has any inward coherency, or whether, as I affirmed just now, from having no original seed, it is utterly coreless and heartless.

A.—You will have some difficulty in proving that, I think, after having first shewn that there is so much evidence in its favour.

B.—We shall see. Does 'Sublime' mean High?

A.—I apprehend so.

B.—And what does 'Ridiculous' mean, Low?

A.—Scarcely.

B.—So I should think, for to say that there is but one step from the 'High' to the 'Low,' is nonsense. There may be but one step; but there is only three-quarters of a step to that which is one quarter less low; and only half-a-step to that which is half as low. When the question is one of measure, it cannot signify where you fix unity; but if it does not mean 'Low,' what can it mean?

A.—Vulgar, mean, absurd.

B.—All which are only the antipodes of sublime when it is used figuratively, as low is its antipode when it is used literally; and therefore the same objection applies to them.

A.—May not ridiculous be used in its honest sense as the synonyme of 'Ludicrous'?

B.—Be it so. But before we apply this meaning to the phrase, let us be careful that we distinguish it from the one we have rejected. Ludicrous, in the acceptation which we are about to give it, means nothing vulgar, mean, or absurd.

A.—I do not see how that follows, from what we have just said. It need not be any of these, but it may be all of them.

B.—What difference did you understand, then, between the 'Ridiculous' and the 'Ludicrous,' a difference of kind, or merely the difference of degree?

A.—Supposing I said, 'merely of degree,' what would you answer?

B.—That as ridiculousness includes all degrees of itself, the distinction was inadmissible.

A.—Well then, I say, the difference is this: the ridiculous is that which is such by nature; the ludicrous, that which is perceived to be such, or made such by art.

B.—That will suit my purpose sufficiently well, though I think we shall soon arrive at a much more rational classification than that which you suggest. When you say, that the sublime is akin to the 'Ludicrous,' in this sense, what do you mean?

A.—I mean that it is akin to the ridiculous in art and not the ridiculous in nature.

B.—But hold? The ridiculous of art, which you rightly define to be the 'Ridiculous perceived or created,' becomes,—when it is created or perceived—the same in kind and quality with the ridiculous which exists in nature.

A.—I do not exactly see your meaning?

B.—Is not Sir Andrew Aguecheek precisely as ridiculous, and ridiculous precisely in the same sense, as any existing fool in Illyria or England?

A.—Certainly.

B.—Then I suppose the distinction which you wish to draw, is not between the ludicrous and ridiculous—between the ridiculous of art and of nature, but between the power of perceiving and the thing perceived. In other words, you mean to say, that Napoleon meant to signify, not that the sublime is but one step from the ridiculous but that the perception of the ridiculous is but one step from—what?

A.—The perception of the sublime, I suppose. Do you not think this may have been his meaning?

B.—But the misfortune is, that it totally destroys

his meaning, for the more sense of the ridiculous, and the more sense of the sublime a man has, the less he is likely to make the sublime ridiculous.

A.—But will this explanation account for the phenomena from which you admitted that this sentiment derived some plausibility. As, for instance, my first class—the speeches of the heroes and martyrs in the French Revolution?

B.—If you study the French literature of the 18th century, you will be convinced that one calamity had already befallen that nation, which was the loss of all sense of the sublime; and that another was likely soon to befall it, which was, a loss of all sense of the ridiculous. And what singularly illustrates the truth we have just been elucidating, one of these effects took place through the other. Voltaire, in teaching his countrymen that the business of ridicule was to parody and counterfeit sublimity, set the two principles at war—took away from wit its natural province, and made such utter confusion between them, that in a very short time it was impossible for a Frenchman to know any thing about either. The effect was not perceived at first, and the other nations of Europe went on imagining that the French nation had a keener perception of the ridiculous than any existing, till the revolution came and proved that there never had been or could be, a nation which ran so headlong into absurdities from the want of it. And thus the union of sublimity and ridiculousness, instead of proceeding from any law of the human mind which connected them, proceeded from the violation of a law which provided for their constant separation.

A.—And the other class of phenomena, the union of sublimity and ludicrousness, and the subserviency of the latter to the former, how do you explain that?

B.—From the opposite cause to that just noted, producing the opposite effect. That true law of connection between the perception of the sublime and the perception of the ridiculous, which had worn out in the French nation, has its highest vigour in the mind of a man of genius. Consequently in never trembling, lest his sublimity should become ridiculous, he is always to exert both the faculties, and to exhibit in the same wonderful work the miracles which are wrought by their united agency. And hence the friendly connection between the scenes of wit and pathos in Shakspeare—hence the easy transition in our minds from the Boar's Head in Eastcheap, to the heath which trembled under the sense of fear. And so let it ever be in literature and art. Let each of their provinces be cultivated to the highest limits of its capacity, and let there be the freest, the most unrestricted commerce between them. Let no port-dues, no prohibiting duties, ever prevent the goods of one from finding their way, by the shortest and easiest route, into the other. Let there be a thorough sympathy between the natures of each—a well-grounded understanding of the other's provincial government and municipal regulations, and let there be one law over them all, deriving its origin and its sanction from that central principle which imparts life to the system, and directs the energies of each part of it, so that it shall best minister to the good of the whole.

A.—And now may it please you to enlighten my dark understanding as to the special object of the conversation into which you have unawares betrayed me.

B.—My object was not very definite when we began to talk, and, as far as I know, I was chiefly occupied with replying to your questions. But if you will have a moral out of every thing, I think we may probably extract one, even from our loose and vagrant dialogue. Do you not think it would be possible to apply the method we have pursued in discussing Napoleon's dictum, to other much more original and important sayings of great men; might it not be a useful exercise to bring to this test many sayings of Dr. Johnson and others who have given bogmas to the world, which exercise a silent and strong influence over its opinions and modes of thinking; first examining them outwardly, to see that facts may have suggested them, and what then

life there is within, which they have derived from the mind of their authors. Omitting the first mode of judging, great men are often intolerant to one another, attributing to original perversity, opinions to which, but for accidental circumstances, they would never have given birth. Omitting the second, ordinary men are constantly paying respect to some dicta which their own narrow experience has made plausible, and rejecting others more important, because the evidence of them is beyond their ken. Uniting both, I think we may be able to excuse the very errors which we are correcting, to account for the very phenomena from which we refuse to draw our inferences.

A.—I shall be happy to join you in making the experiment.

THE LIFE OF LOCKE.

The Life of John Locke, with Extracts from his Correspondence, Journals, and Common-Place Books. By Lord King. 1 vol. 4to: pp. 404. Colburn. London, 1829.

MR. STEWART has observed, with great truth, that Locke is very little read in England. His reputation is almost entirely collegiate or foreign. Educated men generally judge of him either from what is known of his works in universities, where they are used as text-books, and of course dessicated and impoverished into mere heaps of dry bones, or from the renown given him by the French philosophers of the eighteenth century, by Condillac and Voltaire, who understood but little of the books, and nothing at all of the man. Nor is it very wonderful that he failed in making himself easily intelligible to his successors, for he certainly did not very clearly comprehend himself. Honest and modest as he was, he seems to have thought that he was in some degree fitted to write a scientific treatise on the human mind; though he certainly did not fancy that he had produced the complete and circular work which the 'Essay on the Human Understanding' has been called by many of his admirers. On this point we believe that he was mistaken; and we are sure that the million are so still. The service which, in our opinion, Lord King has rendered is the publication of a book that will go far towards convincing every one in how small a degree Locke was a scientific thinker, and how admirable were his practical sense and judgment, and his social virtues and accomplishments.

It is worth while to consider, for a moment, what was really done by Locke in philosophy, and how it came to be supposed that he had done so much which he in fact never did think of, and so much more which so wise a man could never by any possibility have thought of.

The age in which Locke lived was undoubtedly the least poetical of modern history. The human imagination had scarcely ever been so feeble as it then was. From this resulted an almost entire separation between philosophy and real life. The great truths of metaphysics, which for those who first brought them out into distinct consciousness, were living powers, became bare and meagre abstractions. The imagination, wherever it had been vigorous and creative, had always served to connect, in the mind of the speculative thinker, the ideal with the actual world; to impersonate the principles of being as individual conceivable forms; and to clothe and exalt the work-day persons and affairs of society with the light of a higher sphere. This was the genuine and healthy state of the human mind. The two worlds, the world of thought and the world of action, remained perfectly distinct, and each in itself complete; while the imagination moved and ministered between them on its ethereal ladder, attended by all its troop of angelic spirits. In the age of Locke such was no longer the state of things. The loftier and purer region contained no longer those forms born of imagination, without which that region is an object for the intellect only, and cannot be beneficially brought into connection with actual society. It had, therefore, become a pale abstraction hanging above the heads of men, but incapable of engaging

their sympathy or reverence. Nor was Locke a man to separate himself (like Milton) from his fellows, and build up, and people in solitude a spiritual kingdom of his own, not governed by the laws of time or custom, nor liable to the changes of vulgar opinion. He had not himself imagination to re-establish the intercourse between the sphere of ideas and the sphere of practice. And feeling most strongly (as, not being endowed with a creative and spiritual imagination, he was right to feel,) the insufficiency of that which seemed to him, and to all around him, a remote and lifeless system, he began to labour in raising up, out of this sensible frame of things, a compacted and lofty tower, such as might in some degree content mankind by a faint resemblance to the height and order of the heavens which they had no longer wings to scale, and which, in their eyes, was divested of the chiefest portion of its glory.

This is, in few and inadequate sentences, our conception of Locke's design. He wished to re-establish in the minds of thinking men the importance of the actual world. This lay trodden under the feet of his contemporary theorists, while the spiritual region had gone afar off, and was beyond his reach as well as theirs. He, therefore, attempted to raise the sensations and the practical understandings of mankind into the place of honour and power, which it was so important that something else than mere impulse and guess-work should occupy.

Locke was a virtuous and an humble-minded, as well as an able and accomplished man, and where his skill and strength were not adequate to conduct his fellows in safety, he willingly paused, and declared his own insufficiency. He found that his own method of leading men back to practice and common sense would take him only a little way in philosophy; but he seldom attempted to push forward desperately, and he confessed the existence of the difficulties which he could not overcome. Even thus he fell into many hazards, and many contradictions; and remained as far as possible from giving the world an entire and methodical exposition.

On the other hand, let us look into his works for what they really contain of excellent, and we find them the productions of one of the clearest and most cautious understandings that ever gave rules for human conduct. They are covered all over with a rich fruitage of good sense and of the soundest feelings. And there are scarcely any books in which you can find fewer propositions fit to become parts of a scientific treatise, or a greater number of useful, serviceable observations.

But see how his writings have been treated by the French. He tried the experiment of making a system out of our sensations, and failed. He was met on all sides by difficulties which sensations could not account for, and of which he was far too wise, too good, too careful for human welfare, and for morality and religion, to deny the existence. But some of the French philosophers, and more especially Condillac, fearing not at all to expose mankind to dangers which the stronger and better-cultivated mind of Locke had wished to withdraw them from encountering, bravely pushes on to the end with that guidance which the Englishman felt to be insufficient,—tell us that the moral perils which Locke was so honourably afraid of are mere phantoms and delusions, and builds on his foundation a system altogether circular, and towering to the skies, where he had felt that no such thing was possible without shutting out a world of truths to which his quack disciple was utterly indifferent.

'The Life of Locke, by Lord King,' is, as far as his lordship's part in the volume goes, most especially worthless. Two or three rants about toleration, and two or three very needless hits at the church, are almost all that he adds to Locke's papers, and to those facts which might have been found in any biographical dictionary. He attempts nothing like an estimate of the character and writings of the eminent man whose manuscripts he publishes, and does not write one discriminating word as to his influence on society, and on subsequent thinkers. He has throughout modernised the spelling of the papers

he gives us; and yet in nearly every page there is some word, English, French, or Latin, so strangely written that we involuntarily look for a note, and not finding one, are left in doubt whether to attribute the error to Locke's careless writing, or to his lordship's correction of the press. There is, moreover, one omission which we would entreat Lord King to remedy in any reprint of the book. It appears that the papers, some of which he has now published, while others have not yet seen the light, contain a great many references to books, almost all of which have been omitted by the editor. Yet a list of all the works quoted or alluded to by Mr. Locke would have been one of the most curious and valuable documents that Lord King could possibly have published. His lordship does not seem to be at all aware how much controversy has existed as to the extent and nature of this celebrated author's reading, nor to perceive how interesting a subject of inquiry it must necessarily be for every speculative Englishman.

It must not, however, be supposed that we do not think this volume of great value. It does more than all that before existed in print to show us Locke the individual, and thereby to set the genuine man apart from the Locke of the French theorists. In these pages he appears as a perfect gentleman, a kind friend, a keen and general observer, a most accurate and delightful writer, and a man of the strongest and most grounded sense, in all questions of manners, politics, literature, science, and morals. And it is most consolatory to perceive how much more of his mind was devoted to kindness, good humour, universal inquiry, social enjoyment, and sound and active principles, than to that abstract system which, in general estimation, is almost solely connected with his name, and of which only a portion was ever really adopted by him.

What, we would ask, can be more pleasant and gentlemanly than the following letter, written when Locke was thirty-three?

To Mr. John Strachy, Sutton Court, Bristol.

DEAR SIR,

Cleve, 1666.

'Are you at leisure for half an hour's trouble? will you be content I should keep up the custom of writing long letters with little in them? 'Tis a barren place, and the dull frozen part of the year, and therefore you must not expect great matters. 'Tis enough, that at Christmas you have empty Christmas tales fit for the chimney-corner. To begin, therefore, December 16th, (here 26th), Christmas-day, about one in the morning, I went a gossiping to our Lady; think me not profane, for the name is a great deal modester than the service I was at. I shall not describe all the particulars I observed in that church, being the principal of the Catholics in Cleves; but only those that were particular to the occasion. Near the high altar was a little altar for this day's solemnity; the scene was a stable, wherein was an ox, an ass, a cradle, the Virgin, the babe, Joseph, shepherds, and angels, *dramatic personæ*: had they but given their motion, it had been a perfect puppet play, and might have deserved pence a-piece; for they were of the same size and make that our English puppets are; and I am confident, these shepherds and this Joseph are kin to that Judith and Holophernes which I have seen at Bartholomew fair. A little without the stable was a flock of sheep, cut off of cards; and these, as they then stood without their shepherds, appeared to me the best emblem I had seen a long time, and methought represented these poor innocent people, who, whilst their shepherds pretend so much to follow Christ, and pay their devotion to him, are left unregarded in the barren wilderness. This was the show: the music to it was all vocal in the quire adjoining, but such as I never heard. They had strong voices, but so ill-tuned, so ill-managed, that it was their misfortune, as well as ours, that they could be heard. He that could not, though he had a cold, make better music with a cheery chace over a pot of smooth ale, deserved well to pay the reckoning, and go away athirst. However, I think they were the honestest singing men I have ever seen, for they endeavoured to deserve their money, and earned it certainly with pains enough; for what they wanted in skill, they made up in loudness and vanity: every one had his own tune, and the result of

all was like the noise of choosing Parliament men, where every one endeavours to cry loudest. Besides the men, there were a company of little choristers, I thought when I saw them at first, they had danced to the other's music, and that it had been your Gray's Inn revels; for they were jumping up and down, about a good charcoal fire that was in the middle of the quire (this their devotion and their singing was enough, I think, to keep them warm, though it were a very cold night); but it was not dancing, but singing they served for; when it came to their turns, away they ran to their places, and there they made as good harmony as a concert of little ligs would, and they were much about as cleanly. Their part being done, out they sallied again to the fire, where they played till their cue called them, and then back to their places they huddled. So negligent and alight are they in their service in a place where the nearness of adversaries might teach them to be more careful; but I suppose the natural tendency of these outside performances, and these mummeries in religion, would bring it every where to this pass, did not fear and the severity of the magistrats preserve it; which being taken away here, they very easily suffer themselves to globber over their ceremonies, which in other places are kept up with so much zeal and exactness; but methinks they are not to be blamed, since the *rite* seems to me as much religion as the other. In the afternoon, I went to the Carthusians' church; they had their little gentry too, but in finer clothes; and their angels with surplices on, and singing books in their hands; for here is nothing to be done without books. Hither were crowded a great throng of children to see these pretty babies, and I amongst them, as wise and as devout as they, and for my pains had a good sprinkle of holy water, and now I may defy the devil: thus have I begun the holidays with Christmas gambols. But had I understood the language, I believe, at the reformed church, I had found something more serious; for they have two sermons at their church, for Christmas lasts no longer here. That which pleased me most was, that at the same Catholic church the next day, I saw our Lady all in white linen, dressed as one that is newly lain in, and on her lap something that, perhaps twenty years since, was designed for a baby, but now it was grown to have a beard; and methought was not so well used as our country fellows used to be, who, though they escape all the year, are usually trimmed at Christmas. They must pardon me for being merry, for it is Christmas; but, to be serious with you, the Catholic religion is a different thing from what we believe it in England. I have other thoughts of it than when I was in a place that is filled with prejudices, and things are known only by hearsay. I have not met with any so good-natured people, or so civil, as the Catholic priests, and I have received many courtesies from them, which I shall always gratefully acknowledge. But to leave the good-natured Catholics, and to give you a little account of our brethren the Calvinists, that differ very little from our English Presbyterians. I met lately, accidentally, with a young cucking divine, that thought himself no small champion; who, as if he had been some knight-errant, bound by oath to bid battle to all comers, first accosted me in courteous voice; but the customary salute being over, I found myself assailed most furiously, and heavy loads of arguments fell upon me. I, that expected no such thing, was fain to guard myself under the trusty broad shield of ignorance, and only now and then returned a blow by way of inquiry; and by this Partisan way of flying, defended myself till passion and want of breath had made him weary, and so we came to an accommodation; though, had he had lungs enough, and I no other use of my ears, the combat might have lasted (if that may be called a combat, *ubi tu cades ego vapulo tantum*) as long as the wars of Troy, and the end of all had been like that, nothing but some rubbish of divinity as useless and incoherent as the ruins the Greeks left behind them. This was a probationer in theology, and, I believe, (to keep still to my errantry), they are bound to show their prowess with some valiant unknown, before they can be dubbed, and receive the dignity of the order. I cannot imagine why else he should set upon me, a poor innocent wight, who thought nothing of a combat, and desired to be peaceable, and was too far from my own dunghill to be quarrelling; but, it is no matter, there were no wounds made but in Priacian's head, who suffers much in this country. This provocation I have suffi-

ciently revenged upon one of their church, our landlord, who is wont sometimes to Germanize and to be a little too much of the creature. These frailties I threaten him to discover to his pastor, who will be sure to rebuke him (but sparing his name) the next Sunday from the pulpit, and severely chastise the liberty of his cups; thus I sew up the good man's mouth, because the other gaped too much, and made him as much bear my tongue as I was punished with the other's. But for all this, he will sometimes drink himself into a defiance of divines and discipline, and hearken only to Bacchus's inspirations. You must not expect any thing remarkable from me all the following week, for I have spent it in getting a pair of gloves, and think, too, I have had a quick despatch; you will perhaps wonder at it, and think I talk like a traveller; but I will give you the particulars of the business. Three days were spent in finding out a Glover, for though I can walk all the town over in less than an hour, yet their shops are so contrived, as if they were designed to conceal, not expose their wares; and though you may think it strange, yet, methinks, it is very well done, and 'tis a becoming modesty to conceal that which they have reason enough to be ashamed of. But to proceed: the two next days were spent in drawing them on, the right hand glove, (or, as they call them here, hand shoe) Thursday, and the left hand, Friday, and I'll promise you this was two good days' work, and little enough to bring them to fit my hands and to consent to be fellows, which, after all, they are so far from, that when they are on, I am always afraid my hands should go to cuffs one with another, they so disagree: Saturday we concluded on the price, computed, and changed our money, for it requires a great deal of arithmetic and a great deal of brass to pay twenty-eight stivers, and seven doits; but, God be thanked, they are all well fitted with counters for reckoning; for their money is good for nothing else, and I am poor here with my pockets full of it. I wondered at first why the market people brought their wares in little carts, drawn by one horse, till I found it necessary to carry home the price of them; for a horse-load of turnips, would be two horse-load of money. A pair of shoes cannot be got under half a year: I lately saw the cow killed, out of whose hide I hope to have my next pair. The first thing after they are married here is to bespeak the child's coat, and truly the bridegroom must be a bungler that gets not the child before the mantle be made; for it is far easier here to have a man made than a suit. To be serious with you, they are the slowest people, and fullest of delays that ever I have met with, and their money as bad. December 22nd I saw the inscription that entitles the Elector's house here to so much antiquity; it stands at the upper end of a large room, which is the first entrance into the house, and is as follows:—"Anno ab urbe Romanâ conditâ 698 Julius Cæsar Dictator hinc partibus in ditionem susceptis arcem hanc Clivensem fund." I know not how old the wall was that bore it, but the inscription was certainly much younger than I am, as appears by the characters and other circumstances; however, I believe the painter revered the antiquity, and did homage to the memory of Cæsar, and was not averse to a tradition which the situation and antique mode of building made not improbable. The same time, I had the favour to see the kitchen and the cellar, and though in the middle of the first there was made on the floor a great fire big enough to broil half a dozen St. Laurences, yet methought the cellar was the better place, and so I made haste to leave it, and have little to say of it, unless you think fit I should tell you how many rummers of Rhenish I drank, and how many biscuits I ate, and that I had there almost learned to speak High Dutch. December 24,—At the Lutherans' church, after a good lusty, rattling High Dutch sermon, the sound whereof would have made one think it had the design of reproof, I had an opportunity to observe the administration of the Sacrament, which was thus:—the sermon being ended, the minister that preached not (for they have two to a church) stood up at a little desk which was upon the communion table, almost at the upper end of the church, and then read a little while, part of which reading I judged to be prayer, but observed no action that looked like consecration, (I know not what the words were); when he had done, he placed himself at the north end of the table, and the other minister that preached, at the south end, so that their backs were toward one another; then there marched up to him on the north side a

communicant, who, when he came to the minister, made a low bow, and knelt down, and then the minister put water into his mouth; which done, he rose, made his obeisance, and went to the other end, where he did the same, and had the wine poured into his mouth, without taking the cup in his hand, and then came back to his place by the south side of the church. Thus did four, one after another, which were all that received that day, and amongst them was a boy, about thirteen or fourteen years old. They have at this church a sacrament every Sunday morning: in the afternoon, at the Calvinists', I saw a christening. After sermon there came three men and three women, (one whereof was the midwife, with a child in her arms, the rest were godfathers and godmothers, of which they allow a greater number than we do, and so wisely get more spoons,)—to the table which is just by the pulpit. They taking their places, the minister in the pulpit read a little of the Institution, then read a short prayer; then another minister, that was below, took the child, and with his hand poured water three times on its forehead, which done, he in the pulpit read another short prayer, and so concluded. All this was not much longer than the Lord's Prayer, Creed, and Ten Commandments; for all their service is very short, beside their preaching and singing, and there they allow good measure."—Pp. 13—18.

(To be continued.)

THE NEW FOREST.

The New Forest: a Novel. By the Author of Brambletye House, &c. Three vols. Colburn. London, 1829.

THE work before us is unlike the other novels of the author, in this respect, that the time of its action is within the present century. We are inclined to think that this difference will be unfavourable to the popularity of 'The New Forest.' People in general like to read of obsolete or outlandish customs; and an author may be pretty sure of finding readers who professes to retail the forgotten scandal of London in the seventeenth century, and Jerusalem in the days of Mark Antony. We can, however, assure the public that if they will take the trouble to examine at all minutely, they will discover the characters and manners of England in our own time, as represented by the author of 'The New Forest,' to be no less strange and fanciful than those which he has assigned to the Roundheads and the Pharisees. We find in this work, people of the highest fashion described as showing their superior breeding, not by ease and elegance, but by peculiar stiffness and affectation. We have a heroine (Fanny) designed to be one of the most delightful of those delightful creatures, pretty and lively young ladies, and yet ejaculating 'lud!' at every second sentence. We have a Southampton smuggler, one of the most generous and high-minded of men; and a captain (of hussars, we believe,) evidently intended to be a picture of a class, and who is only distinguished from other gentlemen by cowardice and mispronunciation. We might add a dozen more of these extravagances; but they all shrink into obscurity before the dazzling absurdity of the hero.

This young gentleman has been educated in the United States, where he has become an 'Utilitarian.' (Thank Heaven! the word is not English! any more than the thing.) The way in which this prudent personage manifests the principle of 'Utility,' in his conduct, is by throwing about his money (of which he has not much) to every one who is willing to relieve him from it; and by keeping a large stock of the readiest and most profound sensibility for the sufferings of every one around him. Yet, some how or other, it never occurs to this paragon of trans-atlantic philosophy, that his sylogistic pedantry and contemptuous affectation are more annoying to every one he meets than would be the thumb-screw or the rack. Mr. Smith is not, perhaps, aware that there is no proof of a strong propensity to examine every thing by the test of reason, in a fondness for putting bad reasoning into the form of a syllogism. Neither does he seem to know, that a person who should profess to despise the wealthy classes, and should take every oppor-

tunity of treating them uncivilly, would simply be kicked in consequence, out of all educated society, with as little mercy as might be shewn to an unlicked North American bear. It is no doubt very true, that there is no natural distinction of ranks, that men are not born with coronets on their heads, or even with whole coats on their backs; and we do not pretend that money is a virtue. But it happens that the richer classes are, in general, the best instructed, and have the most agreeable manners; and a person who does not feel this is thereby only convicted of not comprehending a kind of merit of which he has none himself. The error of the picture of purse-proud arrogance and ignorance, is this, that in the great majority of cases, there is, in truth, more mental cultivation among persons having some property, than among persons having none. And Mr. Smith, by way of writing a novel with a moral, has merely made a gross blunder in 3 vols. 8vo., which has been committed before him by a dozen other writers. The design of his book is, in fact, substantially the same as that of an old novel, 'Hermesprong, or Man as he is not,' which we are convinced the author of 'The New Forest' never saw, as, if it had fallen in his way, he must have immediately perceived the faults of his own plan.

The story of the book is rather confined, and not very original; but some of the descriptions are pleasant, and of these none so much so as the opening chapter. There are no characters nor scenes of any great force or truth; and the author has succeeded best in the very lowest of his attempts, the talk, namely, of an innkeeper who attends scientific lectures, and hashes into his conversation the blundered nomenclature of natural philosophy.

We subjoin a part of the first chapter, which pleasantly reminds us of Miss Mitford's sketches:

"On the southern verge of the New Forest, in Hampshire, and at no great distance from the sea, stands a large and populous village, to which, for special reasons of our own, we shall assign the fictitious appellation of Thaxted. Its situation and appearance were much more picturesque than might have been expected from its vicinity to the sea, an element which, in our northern latitudes, generally imparts a sterile and unlovely character to the contiguous shores, either preventing altogether the growth of trees, or giving such a stunted, warped, and cankered appearance to those that struggle against the chalky soil and stormy winds, as to make them rather disfiguring than ornamental to the scenery. Such was not the case at Thaxted, which was sufficiently removed from the great landscape-spoiler to be beyond the reach of its baneful influence, and yet near enough to derive from it all those scenic embellishments which so eminently enhance the beauty of a rich land view, by affording occasional glimpses of the gleaming sea, or a white sail, caught beneath the boughs of noble trees, athwart the undulating hollows of the intervening downs, or over an enclosed and cultivated level. The village stood upon the extreme edge of a heath, not of such extent as some of those which, forming spacious openings in the interior of the New Forest, are extensive enough to deserve the name of—

"Vast savannas, where the wand'ring eye,
Unfixed, is in a verdant ocean lost;"

and yet sufficiently large to give breadth, distance, and picturesqueness, to the surrounding scenery. Its opposite extremity was bounded by the forest, forming woody bays and promontories, alternately receding from, and advancing into, the heath; now opening upon some deep dark vista, athwart whose distant gloom the deer were occasionally seen to bound, or from which a timber-wain, in Hampshire called a *tug*, was slowly emerging, under the efforts of a numerous team of oxen;—now throwing forward some prominent grove so far upon the open land, that the tuftings of its noble trees fell into rich masses of light and shade, relieved by the umbrageous back-ground of the Forest. Nor was the heath itself by any means so forlorn or dreary an object as might be supposed. Its broken surface, tufted with every variety of fern, furze, and other wild plants, and presenting here and there the red ochreous banks of a road that wound through it, was tinted with the rich harmonious hues

that a painter loves: detached clumps of trees, breaking its monotony, served to unite its woody boundaries with its area; while a large sheet of water that occupied its centre, was nearly bisected by a long projecting tongue of land, upon which, especially in the sunny evenings of summer, might be seen groups of cattle, or forest mares with their foals, sending their long shadows athwart the golden bloom of the little lake. The view from the opposite side of the gentle eminence on which the village stood, though totally dissimilar, was scarcely less attractive—the eye passing over enclosed corn-fields, pastures, and meadows, till it reached the Isle of Wight, the insularity of which not being perceptible to the eye, gave to the intervening channel the appearance of an extensive lake bounded by rugged cliffs and distant mountains.

A clump of lofty elms and lime-trees, branchless for some distance from the ground, but tufting over luxuriously at top, formed an arch across the road leading to the village, around which numerous flights of pigeons were generally to be seen wheeling and carering; while beneath its aperture might be discerned the low spire of the church embosomed in foliage. Athwart the straggling irregular central road of Thaxted, dignified by the name of the High-street, hung the sign of the chief inn, exhibiting a most bellipotent Saint George on a fiery white horse, having obviously the best of it in a conflict with a portentous green dragon, who seemed to be complaisantly opening his mouth for the express purpose of swallowing his adversary's javelin. The building to which this glaring daub was prefixed, was an ancient low edifice, constructed with solid timbers blackened on the outside, the interstices being plastered and white-washed. A sharp-pointed gable, fretted with half-decayed oak wood, crowned the front; and the roof was of large sand-stones, covered with moss and house-leek, from the midst of which issued a ponderous red brick chimney, placed edgewise, and surmounted with numerous ragged mouldings. The upper story projected over the lower, and the cornice that divided them had sunk considerably on one side, without, however, appearing to have injured the general solidity of the building, which, humble as it was, constituted the most important structure in the High-street.

In passing the irregular assortment of barns, sheds, shops, and houses, thatched, tiled, and slated, that made up the straggling village, the attentive traveller might observe, from the various inscriptions, that there seemed to be but four names in the whole place, the two first exhibiting the unmeaning monosyllables of Wilks and Stubbs, and the remaining two the more rural compounds of Penfold and Haslegrave, which, with various baptismal distinctions, were perpetually alternated and interchanged; while a physiognomist would have been tempted to imagine, from the similarity of the faces surrounding him, that the owners of these four appellations had successively intermarried until the whole village had become, as it were, one numerous family. They who have derided their notions from the golden age or the patriarchal times, might dream that such a mutually connected society, inhabiting so beautiful and sequestered a retreat, would form an united brotherhood of peace and love; while they who contemplate our peasantry, "as truth will paint them, and as bards will not," will not widely err in forming a very different conclusion. In most large families, indeed, the claims of consanguinity are too apt to be forgotten in opposing interests, and the consequent feelings of jealous rivalry; in which respect, the greater part of the inhabitants of Thaxted, "a little more than kin and less than kind," offered no exception to the general rule. Towards the end of the village the road branched off in two directions round a little green, furnished with a finger-post, of which, according to the laudable practice of semi-barbarous England, one of the boards was broken off, and the other rendered totally illegible; while a milestone on the opposite side of the road was equally unserviceable, from its figures having been carefully punched out and obliterated. In front of the green stood the stocks, the neglected state of which attested either the orderly habits of the villagers, or the remissness of the constable; and behind this crumbling machine was a pool of muddy water, termed the horse-pond, on the poached margin of which might usually be seen six or eight ducks performing their toilet with busy beak, and now and then detaching a feather from

their plumage, which was lazily wafted by the wind to join those that fringed the opposite bank.

Our history commences on a Sunday, on the afternoon of which the villagers of Thaxted, who, like most other Sabbath idlers of humble life, often found the unemployed hours hang rather heavy upon their hands, were divided into two knots, one of which, including most of the women and old men, went to attend the funeral of old Isaac, one of their own body, canvassing his age, which was a matter of some doubt, and the little property he had left behind him, which seemed to be involved in equal uncertainty: while the other party, embracing the younger portion of the rustic community, betook themselves to the George Inn, to await the arrival of the London coach, which generally passed through about this hour. Nothing could more strongly mark the vacuity of the day, and the listlessness of the assemblage, than the lounging, lazy interest with which they awaited the appearance of the well-known vehicle, though they expected not that it should bring them any thing new, and they had repeatedly collected upon previous Sundays, at the same spot, at the same hour, to witness the driving up of the same coach, which, as it did not change horses at Thaxted, seldom stopped more than three or four minutes at the George. At length it came in sight, passed under the arch of trees to which we have already alluded, blessed the eyes of such dwellers in the High-street as were drawn to the windows by the sound of the horn, and finally drew up at the George, when the spectators, who had been waiting so long for the information, were enabled to ascertain once more, that it was driven by Ned Davis as usual, was drawn by the four customary horses, and conveyed no passenger, either inside or out, whose appearance was calculated to excite the least attention. Fortunately, however, for the gazers, something new was at last discovered, which effectually prevented their dispersion. A portion of the iron binding, or tyre, had been detached from one of the wheels, and the coach could not safely proceed until it had been replaced. A board upon the very next house but one announced that its occupant was—"John Stubbs, Horse-farrier, Bullock-leech, and Blacksmith;" but it was Sunday, the shop was shut up, and the rustic Vulcan was not at home; though several voices simultaneously declared that he would be sure to be found down at the Cricketers.

The driver, as is usual with English coachmen upon every emergency, cursed and swore very heartily at the coach-cleaner, whose business it was to have examined the wheels; the wielder of the whip being now-a-days much too important a personage to attend to any department of his own vehicle, beyond the driving it. The gaping rascals busied themselves in conjectures as to where, when, and how the accident had happened; until one of their body, a little shrewder than his companions, suggested that the truant iron must be somewhere; (a proposition which met with a ready assent and repetition from the others,) and that it might be advisable to despatch a boy in search of it. This advice was taken by the coachman, though not until he had declared that any fool could have thought of that expedient; and lest he should be anticipated in his farther measures by some other of the bystanders, he immediately sent a second lad in quest of Stubbs the blacksmith, and himself called lustily for Sam, the ostler of the George; asking his opinion, when he appeared, whether the wheel would go safely as far as the Mermaid, in case they could not find the missing iron.—Vol. 1, pp. 1—11.

Before we dismiss 'The New Forest,' we really must be allowed to express our wish that men of talent and good intention would not allow themselves to be seduced by their booksellers into writing works for which nature has not designed them. For small ætææ and good-humoured caricatures, the mind of Mr. Smith is admirably qualified; but he has no vocation to fill three volumes with wit, wisdom, eloquence, passion, and character; and much less is he justified in attempting to embody in his personages any set of philosophical opinions. He had much better at once give up the attempt of teaching the world to swear by 'utility,' more especially as it is obvious that he has far too much good taste and good feeling long to remain a preacher of one dull, couched sophism.

CONSTANTINOPLE IN 1828.

Constantinople in 1828. A Residence of Sixteen Months in the Turkish Capital and Provinces; with an Account of the Present State of the Naval and Military Power, and of the Resources of the Ottoman Empire. By Charles Mac Farlane, Esq. 4to. Saunders and Otley. London, 1829.

(Concluded from p. 388.)

At the conclusion of our former notice of the work of Mr. Mac Farlane, it was hinted that, in the changes now operating in the manners of the Turks, proofs were not wanting that, in their advances towards civilization, the Musulmans were not less disposed to adopt the evil habits than the good customs of their models and masters. The following is an amusing instance of the laxity with which the injunctions of the Koran, on a very important point, are now regarded:

'I was roused from my musings by a shouting among the ruins (of Eurythra). It was one of my Turks, who pointed to the sun, giving me to understand its progress warned us to think of moving.

'When we descended the Acropolis, he told my guide that for some time he had not been able to find me; that I was hidden among the stones, and, he was quite certain, performing some incantation to discover the concealed treasures!

'We spread our provisions by the mill, under a willow that dipped its foliage in the sparkling brook. I had brought some wine with me from Chesmè. To my great surprise, when the forbidden liquor was produced, the Turks asked me for some. I handed them the skin, in which there might be five or four bottles; they returned it, but not a drop of wine was there in it. I well knew that half of the Moslems in this country have conquered their religious scruples in this respect. I have seen them drink wine, but always rather privately—a *l'écarté*. Here there were eight staunch Turks wetting their whiskers in the reprobated draught, without awe or any mis-giving of each other! I admired the proof of their progress in civilization, but wished they had left me a little wine for my supper, as I knew I should get none in the Turkish village where I proposed passing the night. After dinner, the occupant of the little mill, a quiet, good-natured old Turk, prepared us some coffee: we lit our pipes, and enjoyed the oriental *keff* in its perfection. The group we formed was rather a curious one. My eight fiercely mustachoeed, turbaned, bare-legged Turks, sat round me cross-legged, with all their arms hanging cumbrously upon them. Our mules were tied by the legs, near the mill; at a window in which, ever and anon, a veiled face and a pair of black eyes presented themselves to reconnoitre—the daughter, or perhaps the wife of the miller.'

To many of our readers, perhaps, the most agreeable specimens of Mr. Mac Farlane's style would be extracts from some of the highly graphic descriptions in which his work abounds, of Turkish groups and scenes, or of his accidental rencontres with Musulman dames, by no means reluctant to be the object of the admiration of the Frank. But such pictures as those we allude to, and some of them are most happily painted, are numerous scattered throughout the book, and it would be difficult to select one or two more skilfully or more faithfully worked than the rest. The present crisis of Turkish affairs besides attaches more than usual importance to the habits and sentiments of the men, and make us regard the proceedings of the inmates of the harem as of little comparative interest.

We shall, therefore, pass by the many interesting situations into which our traveller is thrown in his excursions in Asia Minor, and attend him on his arrival at Constantinople at the beginning of the first Russian campaign, and during the absence of the ambassadors of the three allied Powers. The following presents a lively picture of a Turkish minister at this period, and of the motives which actuate his conduct in affairs of state:

'By the ambassador's (of the Netherlands) advice, I called on Mr. S——, an English merchant, who had not considered it necessary to leave Constantinople with Mr. Stratford Canning, and who had been nominated by the Turkish authorities as a sort of deputy, or represent-

tative of the British subjects that had remained like himself. It was considered necessary that he should present me to the governor of the Christian suburbs of Pera and Galata. To Mr. S—— I was also kindly recommended by my friend E. as to an upright and hospitable Englishman, whose society could hardly fail to be agreeable in a place where there were only two other Englishmen besides himself. He conducted me at once to the bey, who was no less a personage than Achmet Papooshji, a few years before a maker of slippers (as his name implies) at Galata, where he was now governor, and a few months after captain-pasha, or high-admiral of the Ottoman empire. I have already, I believe, more than once alluded to the rapidity of promotions like the present, and to the facility with which the Turks generally assume manners and dignity adapted to their altered circumstances; I have hinted too, that much of this may depend on the adventitious aid of dress, and flowing robes. With this great set-off Achmet Papooshji was unprovided; he wore the simple dress of a tactics officer, which hung shabbily on him, and did nothing to conceal a low, vulgar person, and a more vulgar face, on which *canaille* was written in characters so pronounced and legible, that "those that run might read." We found him seated in a small room at the Turkish *cancellaria*, or general police office, &c. at Galata. He was on a sofa, covered with scarlet cloth, and was of course smoking. His chiboukji sat on the floor, with his eye fixed on the important pipe-bowl; and some half dozen of fellows in gilt jackets, and armed to the teeth, stood in the corners of the room or by the door. Achmet received us very uncourteously, and when Mr. S—— presented me as an *Ingles*, a traveller who had come to pass a few weeks at Stamboul, he merely said, that I remained under the responsibility of Mr. S——, and dismissed us. The secret, the motive of this incivility I was soon informed of. After the departure of the English ambassador, the porte had thought proper to meddle with our subjects, the Maltese and Ionians, who here, as at Smyrna, live in great numbers, and who, to tell the plain truth of them, are not always the most orderly and respectable of men. Hundreds of these fellows had been arrested by the bey's guards in the streets of Pera and Galata, and without any time being allowed them for preparation, were heaped on board of small and unsafe ships, and sent down the Dardanelles. The professed object of government was to clear the capital of a set of vagabonds, and not to molest any respectable persons; but the measure, like all others, was varied in its application by the officers intrusted with its execution, and Achmet Papooshji, who was at the head of it, caused many respectable men to be seized in the streets. This could be turned to his advantage in two manners, he could sell his protection and a permission to remain, to the persons thus seized, or by sending them off *instantly*, he could put his seal on their property, and help himself with impunity. He had in this manner disposed of the person of a respectable Ionian doctor, who had at the time of his arrest a certain small box containing 20,000 piastres, carefully deposited at his lodgings. This box had fallen into the hands of Achmet, who had shown a strong disposition to keep it, and had been much enraged at my friend S. for bestirring himself in the matter, as he had done on receiving a letter from the poor Ionian. When I afterwards had occasion to visit Achmet with a gentleman who had no subject of dispute with him, I found him much more polite.—Pp. 260, 261.

The subjoined sketch is illustrative of Turkish character, and of the sentiments prevalent at Constantinople on the breaking out of the war with the Russians. The concluding speculations of our author, proceeding as they do from an observer who has taken so enlarged and impartial a view of the circumstances of both parties, well deserve attention:

'Turning from the deserted streets, I entered the vast bazaars, where I could no longer complain of being in a solitude, for Turks, Armenians, and Jews were seated in the front of their open magazines; and I met groups of Turkish women at every step, yet Devide complained of desertion, and said that, compared with the manner in which, at that hour of the day, they used formerly to be thronged, the bazaars were as dull as cemeteries.

'Near the bazaars, we paid a visit to a celebrated chiboukji, an old acquaintance of my friend Mr. Z——. He occupied a room in a spacious khan, where a strange

looking set of Turkish traffickers from different parts of the empire lived in rooms like cells, that served them at once as magazines and dwelling-houses. The chibookji received me graciously as the friend of an old friend, and gave me a pipe and coffee. To inquiries that I suggested to Davide, he replied without reserve, and being naturally rather loquacious for a Turk, we had considerable conversation. The chibookji complained of the exceeding dullness of trade: he had never known times so bad; there was no selling a single amber or enamelled mouth-piece; no disposing of a pipe, except common trash at six piastres the piece, to the Asiatic recruits for the army—articles and customers with which he, as one at the very head of the trade, deemed not to deal. His next door neighbour, a retailer of shawls and embroidered handkerchiefs, he said, was equally slack. "These are bad times, sir," added Davide, as he helped me to the full understanding of the chibookji's speeches, "when Turks can buy no pipes and shawls, and their women no embroidered handkerchiefs, times are bad indeed at Stamboul." I should indeed judge these two trades to be a pretty fair criterion for the state of the rest, (putting aside those connected with the supply of the absolute necessities of life,) and our entertainer assured us that the whole khan was deserted for days together, as if an evil eye had been cast upon it.

"When we came to speak of the war and the Muscovites, the old Turk groaned and shook his head: he partook of the depression of spirits which, as I have already mentioned, was evidently pretty general at the opening of the campaign; but when he heard an allusion to the possibility of the capture of Stamboul, his eyes glistened, and he struck his pipe with such violence on the floor, that the bowl flew from the stick. "Ishallah! that shall never be!" said he, raising his voice that had hitherto been in the usual Turkish tone, (I wish some nations who pride themselves on their civilization would imitate it), soft and subdued—the very voice of gentleness.

"Baccalum!" mildly rejoined my Chaldean, who was tormenting the old man all the time; "but if the Muscovites do take the city after all, what will you do?"

"As there is one God! I will stab to the heart my wife and my children—no Ghisours shall touch them! Mashallah!"

"And what will you do then?"

"I will take my yataghan and pistols and destroy as many of the Muscovites as I can—and then I will run into Asia!"

"But the Muscovites have swords and pistols too—you are an old man—a man of peace, unused to warfare—they may kill you, before you can kill one of them!"

"Allah-Keirim! (God is great!) I shall then die a shehgid!"

"Notwithstanding that fanaticism may be on the decline, and that many Turks giving utterance to such projects, would be incapable of proceeding to such horrible extremities, I cannot doubt but that the last struggle would be a tremendous one. The Russians, or any other power, victorious even to the walls of Constantinople, might there meet a repetition of the horrors that the fanatic Jews offered in Jerusalem to the Romans—if indeed they were not themselves repulsed by the last effort of despair and madness. The weak and the timid might seek safety in Asia, but the hosts driven from their homes in the European provinces already overrun—men deprived of all their earthly possessions—would be admirably prepared for martyrdom, and the ready recipients of the suggestions of fanaticism; to these the more determined portion of the population of the less warlike capital might add many thousands; nor do I conceive that Constantinople could be taken until this multitude was absolutely annihilated, and the city reduced to a smoking ruin, with nought left to peer above its ashes save its ancient walls, its imperial mosques, the stone-built departments of the seraglio, and a few other edifices, from the nature of their construction, impervious to fire.

"In fine, without any pretension to the gift of prophecy, I feel myself a conviction, from what I have read, and directly seen and heard, that the last day of Ottoman misrule in Europe (and that day, though perhaps yet remote, will come,) will be a day of blood and atrocity unparalleled in modern ages, and for a type or diminutive

representation of which, we must recur to what happened on the subversion of some ancient nations."—Pp. 271—274.

We cannot close our notice of this volume without again recommending it strongly as a highly interesting narrative, in which an air of truth is preserved amidst descriptions pleasingly, and sometimes even vividly, wrought. Little inaccuracies, the consequences, perhaps, of haste in bringing out the work, are here and there observable, and may be corrected in a second edition: we allude particularly to a passage in which a Turk is made to betray sad confusion in his notion of the relative value of fractional parts. The atmospheric effects at the Bosphorus, it is to be observed also, must be remarkable indeed, if to the beholder from the Asiatic shore the dwellings on the European side of the channel appear of the same size as the buildings immediately before him: yet so they are represented in the view of Constantinople with which the quarto volume of our author is embellished. These are faults which detract but little from the value of the book, and which we notice less for the purpose of pointing them out to notice, than with the view to show that they have not escaped our observation, and to prove that the praise we have in other respects had the satisfaction of bestowing is not indiscriminate.

FREDERIC THE GREAT.

Friedrich der Grosse, seine Familie, &c. Frederic the Great, his Family, Friends, and Court; or, My Twenty Years' Residence at Berlin. By D. Thiébault, formerly Professor at the Equestrian Academy of Berlin. 2 vols. large 8vo. Leipzig, 1828.

THE son of M. Thiébault published a fourth edition of the 'Souvenirs de vingt Ans de Séjour à Berlin,' in the year 1827, but administered so strong an opiate to his readers by rendering it the vehicle of personal comment and family episode, that the literary world ought to feel grateful to the anonymous writer of the present condensation for reducing the five tomes of the original into the more portly form of two neat octavos. Thiébault himself was undoubtedly placed in a situation to observe the immortal Frederic, such as he appeared when he became individualized; when, casting aside the trappings and incumbrances of royalty, he filled his allotted station in the busy drama of domestic life: and his biographer would have exhibited better taste had he been less anxious to constitute himself into a leading personage of the drama, and more apt to remember how insignificant must appear the most signal occurrence which befel him, when placed in juxtaposition with even the bagatelles appertaining to the personal history of the greatest man of his age.

The first book of the present publication portrays the Prussian monarch in his every day character, and records his studies, opinions, literary occupations, journeys, private life, old age, last sickness, and dying moments. The second introduces us to his consort, the crown prince, his successor and nephew, Frederic William, and other princely personages. The third book, with which the second volume opens, describes the court, its festivals, and *dramatis personæ*, Pöllnitz, Nesselrode, de Guines, General Nugent, Prince Dolgouki, Cobenzel, et eis similes. The fourth renders an account of Frederic's civil and military administration; and the fifth and last is devoted to his academies, his system of public education, and his literary familiars, Jordan, Voltaire, Maupertuis, d'Argens, Algarotti, de Prades, &c.

Such is the attractive matter of which these two volumes are composed; and we should have been well pleased had our limits permitted us to have brought the reader better acquainted with them. We shall commence by proving with how much injustice Frederic has been charged with harshness and want of feeling; and the following anecdote is but one out of a thousand instances which his private life affords, of the kind and affectionate heart which throbbed within his bosom. It refers to the death of Prince Henry:

"This young prince was in his eighteenth year, and

had just completed his education; the king had given him a regiment of cuirassiers, which he was on his way to join, previously to taking the command of it at the manoeuvres of the spring season, near Berlin. On the journey he fell sick with the small-pox, and in seven or eight days lay a corpse in a small town. The sorrow occasioned by this melancholy occurrence was deeply and universally felt, and it was poignantly enhanced by the hopes justly derived from the prince's intellectual endowments and amiability of character. Some months after this event the king came to Berlin, and, according to custom, ordered me to attend him. As soon as I entered he addressed me in the following words, "You are aware how severe a loss the state and myself have sustained. This calamity has preyed in a particular manner on my own feelings. Not a day has passed in which I have not dwelt upon the estimable qualities by which the prince rendered himself respected and beloved. I did not deem it sufficient to dwell on this recollection only; but considered it my duty to record what he was, by means of a faithful portraiture, which might rescue from oblivion that which was most estimable in his character, and at the same time justifies my own anguish. I think that such a portrait of his youthful career may prove a useful mirror for those whom fortune calls to a similar station, as well as to those who are capable of rising to high eminence. I endeavoured, therefore, to divert my sorrows into a channel which might be beneficial to society, and have sketched out a panegyric on this greatly and sincerely lamented prince. I am desirous that this composition should be read at a public sitting of my academy, and have selected yourself for this purpose. The sketch is, however, by no means in a finished state; several passages in it require to be remodelled; but, whenever I have sat down to the task, the image of my nephew, and that alone, has so engrossed my every faculty, that I have found myself incapacitated from using my pen. This will account for the numberless alterations in my attempt, and I have, therefore, to request you will copy it out in a very plain and legible hand, leaving so large a space between the words and lines that I may be able to insert such variations in it as may appear necessary. But you are not familiar with my hand-writing, and may not be able to read it; indeed it is a scrawl, and not fit to be called writing. On this account I shall read it over to you first of all; and request you will not only prepare the copy I desire, but report to me whatever faults may have escaped me, either against grammar or propriety of expression." The king here took his sketch and laid it on a small square table, which he had always by his side, strewn with books, writing materials, paper, and several snuff-boxes. He commenced reading his composition like a person labouring to suppress his feelings; it was perceptible that his voice was striving to retain the mastery over his emotion; he spoke slowly and made long pauses, but his firmness soon gave way; his tone became tremulous at the second page, and tears started into his eyes; every moment he was forced to stop and have recourse to his handkerchief; it was in vain for him to attempt restraining his tears, or clearing his throat; and he sunk under the effort by the time he had reached the fourth page. A burst of tears now overcame him so completely, that he was deprived of any further power of utterance, and could do no more than silently give me the paper, his hand trembling as he extended it. I took it from him with those feelings of reverence and consolation which arose from the conviction that this exalted individual was no stranger to the most affecting and sacred impressions of which human nature is susceptible. After some minutes of uninterrupted silence, Frederic at last addressed me, "You are aware of my wishes. Fare ye well!"

It has been reported of Napoleon Buonaparte, that he had duplicate sets of his favourite authors in his several libraries at Paris, St. Cloud, Fontainebleau, &c. In this respect, the Prussian sovereign had adopted the same plan long before him:

Frederic had five libraries, each of which was a counterpart of the other; they were stationed at Potsdam, Sans Souci, Berlin, Charlottenburg, and Breslau: by this means, when he travelled from one of these spots to another, he had no further trouble but to note the page at which he had left off, and could then continue his readings without interruption. For this purpose, five copies

were purchased of every publication he ordered. In the first class of his favourite authors stood Homer, Plato, Demosthenes, Herodotus, Thucydides, Diodorus of Sicily, and Plutarch; then came Virgil, Horace, Cicero, Sallust, Caesar, Livy, Tacitus, and the philosophical works of Seneca; and last of all, were Corneille, Racine, Molière, Bossuet, Flechier, Fenelon's *Telemaque*, d'Aguésseau, Montesquieu, and Bayle; besides the principal works of the French historians, such as Héaumont, &c. Changes were frequently made in the contents of these libraries; some authors were dismissed, either because the king conceived he had pored over them long enough, or, perhaps, from his estimate of their value having abated; others, like Voltaire, were placed upon his shelves as they successively appeared, or because he deemed them worthy of such an honour. The ancient writers figured in his collections in the shape of the best translations at that time extant in the French language, for he had but a slender knowledge of Latin, and knew nothing at all of Greek.*

A passage of the second volume would lead us to extenuate more readily the credulity which has hallowed the name of that monstrous miracle-monger of our own days, the notable Prince Hohenlohe. In matters of faith, at least, the vulgar have seldom been cried down for aping their betters; and it must assuredly be deemed lawful, that the fooleries achieved by the more enlightened at Frederic's court should be quoted in vindication by the less enlightened, who fill the court of his highness the knight-errant of the actual *regina celi* of Catholic mythology.

* M. von Kleist, says our biographer, 'who was Canon of Brandenburg, together with several other noblemen of distinction, (among whom were generals and persons high in office), became acquainted with a charlatan, who gave out that he was able to discover hidden treasures by the aid of the devil. A species of honourable compact was formed between these several parties; its object was to practise this sublime art for the common benefit of the whole crew; and the impostor was not only richly remunerated in anticipation of his mysterious revelations, but he was promised a certain portion of the treasures which were to be revealed to them. There was no folly in which they did not embark with a view to effect their purpose; every species of mummery which could be extracted from the experience of witches and enchanters, was brought into play; and his Satanic majesty was cited before them by all possible modes of incantation, at every hour of the night, and in the most distant and deserted places. The greatest and most costly sacrifices were made in order to propitiate his adamant heart; but nought would avail; Belsebub was too wary to be caught in their toils. The *dernier resort* was at last adopted, and his altar was to be consecrated by a black ram, which had not a single white hair on any part of his body. But such an animal was not of easy acquisition; all Brandenburg, Mecklenburg, and the adjacent countries, were turned inside out, but without effect; foreign lands were explored in quest of the inestimable creature, and a remote corner of Lithuania brought it ultimately to light. The ecstasy of the party does not admit of description; the ram was obtained almost at the price of his weight in gold, and conveyed with religious care to Brandenburg; nor was a more perfect specimen of this genus ever offered up at the shrine of Bacchus. But with whatever diligence and attention the victim was at length conducted into the presence of the confederates, the peans addressed to the Spirit of Darkness remained bootless, and his diabolical excellency, whether from spite or ingratitude, remained deaf to their vehement supplications. That the parties concerned should not only have been disappointed of their expected treasures, but have brought themselves still nearer to their ultimate ruin, formed no unnatural *dénouement* of this farcical enterprise.'

This occurrence induces some observations on the narrator's part, which affords us a still more amusing peep behind the scenes, with which we close our notice of this interesting work:

'Is it unreasonable to express surprise, that men of rank and education, men who were not devoid of all intellect and merit, should be capable of committing such absurdities? And that this should happen under the reign of a princely philosopher like Frederic, among per-

sons moving about his very court and person? And yet under the nose of that same ruler, who wrote the sacred commentary on the *ass-hide*, Laméthrie, a most inveterate apostle of materialism, was known to beat the cross when it thundered; Maupertuis, who was as little of a Christian as the former, would kneel down every evening and say his prayers; d'Argens, whose mind was encumbered with no religious feelings at all, would avoid sitting down to dinner with thirteen persons, and devote the first Friday in every month, as a *jour de bonne fortune*, to the writing and opening of letters; the Princess Amelia would set out her cards, and have her future destiny expounded from them; and the whole court seriously believed in the white dame, who should make her *début* with a long besom in a certain apartment of the palace, and cleanse it out with might and main, in token of the approaching decease of some member of the royal family.'

NATURAL HISTORY.

The Library of Entertaining Knowledge, Vol. I. Part II. The Menageries: Quadrupeds, described and drawn from living Subjects, published under the Superintendence of the Society for the Diffusion of Useful Knowledge. 12mo. Knight, London. 1829.

THE completion of the first volume of the 'Menageries' has been looked for with impatience. The general interest attached to the subject so judiciously selected for the commencement of the new Library, the excellent sample afforded by the first part, the popular arrangement of its matter, the variety of entertaining anecdotes it comprised, and the easy and appropriate style in which it was written, created a desire for the speedy appearance of the continuation, which the society, under whose superintendence this series of works is publishing, have done well to indulge, as, we judge by their advertisements, they have deviated from their original intentions for the purpose of doing, by hastening the publication of another part of the 'Menageries.'

This second part contains the natural history of the camel, llama, giraffe, antelope, and deer. The account of the camel, and of the well-known peculiarities by which the care of an all-providing Nature has distinguished that animal, and adapted it for the desert regions in which it is its destiny to exist, is full of lively interest. The most curious particulars relating to its instinct, conformation, and habits have been diligently collected, not only from the reports of the most esteemed travellers, who have given the narrative of their journeys to the world, but from original sources of the same description, with which the public were before unacquainted. Of the latter class are the valuable communications, the result of recent observations, of Mr. Mac Farlane, the author of the newly-published work 'Constantinople in 1828.' One remark especially of this traveller suggests some curious reflections, on the nature of the antipathy which the horse is supposed to entertain for the camel, and which is strongly shown in some instances, while in others the symptoms of it are so slight as to give rise to the opinion that in the countries where both animals abound, an hereditary conquest of the prejudice has been effected*. This inference is not

* A curious instance of an antipathy of this kind in mules, and of the sensitiveness of those animals to the vicinity of the object of their disgust or alarm, occurred, a few years since, to the writer of this notice, on a journey from Palermo to Cefalù. The animals, which were three in number, became uneasy and scarcely manageable (although in a different degree, according to their individual strength and vigour) at a point of the road in which no cause for their alarm was perceptible either to the riders or their guide. The view in front extended only a few hundred yards; the sea was on one side, but all was calm; no Phœdra had been sighted; nor had the trident-bearing god sent any terrible monster to affray the beasts and work the revenge of a deluded parent: on the land side, every thing was equally tranquil; still the mules were restive, nor was it without difficulty that they were compelled to go forward; and it was some time after a promontory had been doubled that their uneasiness was explained by the overtaking a showman with his camel. It is worthy of remark, also, that the terror or dislike of the mules was even less strongly shown on a nearer approach to the camel, and when it

quite satisfactory; the conquest, we think, must be considered less an inherited virtue than the result of individual education. Camels we see led about the streets of European cities without occasioning any great confusion among our charioteers or horsemen; and surely the patience of our steeds in this case is to be attributed to their excellent training and subdued temper, it may be to a philosophical disregard of wonders common to brutes and men of experience, rather than to qualities descending from sire to son.

For the detail of the habits of the camel, we refer our readers to the 'Menageries,' chusing for their present entertainment, and as a specimen of the interesting nature of the contents of this second part, to extract from the natural history of antelopes, a short account of the curious species of that animal the springbok (the *antelope euchore* of Burchell), an inhabitant of Southern Africa, and well known to the colonists at the Cape. Its name of springbok is derived, we are told, from the extraordinary leaps it is in the habit of taking when hastening its pace. 'In these bounds,' says Burchell, 'the animals rise with curved or elevated backs high into the air, generally to the height of eight feet, and appearing as if about to take flight.' 'Some of the herds,' he adds, 'moved by us almost within musket-shot, and I observed that in crossing the beaten road, the greater number cleared it by one of those flying leaps; although as the road was quite smooth and level with the plain, there was no necessity for their leaping over it.' A peculiarity in the exterior of this animal, remarked by Burchell, as distinguishing it from all known species, is the very long white hair lying flat along the middle of the back, and nearly concealed by the fur on each side, except when the animal takes its extraordinary leaps, when it becomes expanded.

A remarkable circumstance in the natural history of this animal are its migrations in innumerable swarms from unknown regions in the interior of Africa to the abodes of man. The following description of these migrations is furnished to the 'Menageries,' by Mr. Pringle, to whom it was addressed by his correspondent Captain Stockenstrom, a native of the country, chief civil commissioner at the Cape:

'It is scarcely possible for a person passing over some of the extensive tracts of the interior, and admiring that elegant antelope the springbok, thinly scattered over the plains, and bounding in playful innocence, to figure to himself that these ornaments of the desert can often become as destructive as the locusts themselves. The incredible numbers which sometimes pour in from the north, during protracted droughts, distress the farmer inconceivably. Any attempt at numerical computation would be vain; and by trying to come near the truth, the writer would subject himself, in the eyes of those who have no knowledge of the country, to a suspicion, that he was availing himself of a traveller's assumed privilege. Yet it is well known in the interior, that on the approach of the *trek-bokken*, (as these migratory swarms are called,) the grazer makes up his mind to look for pasture for his flocks elsewhere, and considers himself entirely dispossessed of his lands until heavy rains fall. Every attempt to save the cultivated fields, if they be not enclosed by high and thick hedges, proves abortive. Heaps of dry manure (the fuel of the Sneeubergen and other parts,) are placed close to each other round the fields, and set on fire in the evening, so as to cause a dense smoke, by which it is hoped the antelopes will be deterred from their inroads; but the dawn of day exposes the inefficacy of the precaution, by showing the lands, which appeared proud of their promising verdure the evening before, covered with thousands, and reaped level with the ground. Instances have been known of some of those prodigious droves passing through flocks of sheep; and numbers of the latter, carried along with the torrent, being lost to the owners, and becoming a prey to the wild beasts. As long as these droughts last, their inroads and depredations continue; and the havoc committed upon them is of course great, as they constitute the food of all classes; but no sooner do the rains fall than they disappear, and was in sight, than at a distance, and when it was only by quickness of their scent that they could have been sensible that any object of their antipathy was near.

in a few days become as scarce on the northern borders as in the more protected districts of Bruinjes-Hoogte and Camdeboo.

'The African colonists themselves can form no conception of the cause of the extraordinary appearance of these animals; and, from their not being able to account for it, those who have not been eye-witnesses of such scenes consider their accounts as exaggerated; but a little more minute inspection of the country south of the Orange River solves the difficulty at once. The immense desert tracts between that river and our colony, westward of the Zeekoe River, though destitute of permanent springs, and therefore uninhabitable by human beings for any length of time, are, notwithstanding, interspersed with stagnant pools, and *vleys*, or natural reservoirs of brackish water, which, however bad, satisfies the game. In these endless plains, the springboks multiply, undisturbed by the hunter, (except when occasionally the Boesjesman destroys a few with his poisoned arrows,) until the country literally swarms with them; when, perhaps, one year out of four or five, a lasting drought leaves the pools exhausted, and parches up the soil, naturally inclined to sterility. Thus want, principally of water, drives those myriads of animals, either to the Orange River or the colony, when they intrude in the manner above described. But when the bountiful thunder-clouds pour their torrents upon our burnt-up country, reanimating vegetation, and restoring plenty to all graminivorous animals,—then, when we could, perhaps, afford to harbour those unwelcome visitors, their own instinct and our persecutions propel them again to their more sterile but peaceful and secluded plains, to recruit the numbers lost during their migration, and to resume their attacks upon us, when their necessities shall again compel them.'

To this, Mr. Pringle himself adds the result of his own observations as follows:

'To the above description of the migratory swarms of springboks, I have little to add from my own observation. I once passed through a most astonishing multitude scattered over the grassy plains near the Little Fish River. I could not, for my own part, profess to estimate their number with any degree of accuracy; but they literally *whitened*, or rather *speckled*, the face of the country as far as the eye could reach over those far-stretching plains; and a gentleman, better acquainted than myself with such scenes, who was riding with me, affirmed that we could not have fewer of these animals, at one time, under our eye, than twenty-five or thirty thousand.

'I am not aware whether any species of antelope nearly allied to the springbok is to be found in the northern parts of Africa, or in Palestine; but it is a singular circumstance that the name of this animal, in the Bichuana language, (*tache*), is precisely the same as that used in the Song of Solomon, to designate an animal of the antelope family, erroneously rendered *roe* in our translation.

'The springbok is easily tamed when caught young. I have seen it, in several places, reared as a plaything for the children, at the farms of the colonists,—sometimes playing like a pet lamb about the doors, among the numerous swarms of dogs and poultry,—in other instances accompanying the flocks of sheep and goats to pasture, and returning as regularly and quietly as the rest.

'Such facts demonstrate how easy it would be, with a little care and management, to enlarge the list of domesticated animals, by adding to them many species of such as are at present considered the most shy and impracticable.'

These swarms, it seems, do not come to the cultivated plains unattended. The Baron Cuvier says:

'The lion has been seen to migrate, and walk in the midst of the compressed phalanx, with only as much room between him and his victims as the fears of those immediately around could procure by pressing outwards.'

The wood-cuts seem as numerous, as faithful, and as full of character as those of the first part: and to the other recommendations of this volume, it is but justice to add, that it is, beyond all comparison, the cheapest book in the market.

HISTORICAL ESSAY ON MAGNA CHARTA.

An Historical Essay on the Magna Charta of King John; to which are added, the Great Charter, in Latin and English; The Charters of Liberties and Confirmation, &c. By Richard Thomson. 8vo. London, 1829. Major, and Jennings.

THIS publication deserves notice on account of the spirited style in which it is got up, and of the great taste displayed in its embellishments. We should be sorry that these should go unrewarded, yet the work is of such a nature that we fear a limited sale only can be expected for it. The admirer, however, of the most excellent of our ancient institutions, and of the charters more especially to which for so many centuries Englishmen have been accustomed to refer as the standard of their liberties, will be glad to find the history and the contents of these documents collected into a small compass, and illustrated by decorations no less beautiful in their kind than characteristic of the age in which the events to which they refer took place.

The principal of these illustrations is the discovery, by Archbishop Langton to the barons of England, of the charter of liberties granted by Henry I. The engraving, which is on wood, is taken from the painting preserved in the Picture Gallery at Oxford, and is executed by Mason, after a drawing by W. H. Brooke. The work is such as would be expected from the united labours of two artists so eminent in their respective branches. The cut, minute as it is, is perfectly beautiful; the figures of King John and of the ecclesiastics and knights of his age, and the drawings of castles and other buildings, most of them faithfully represented after authority derived from ancient monuments, which decorate the heads and corners of the pages, together with the initials and tail-pieces to the chapters, are specimens in which the simple style of drawing of ancient art is happily united with the freedom of execution of modern times. They are remarkable, moreover, for the true feudal character thrown into them.

From the vast mass of illustrative letter-press by which the characters are accompanied, we select, as a specimen of Mr. Thomson's mode of annotation, the following brief memoir of Eustace de Vesci, one of the twenty-five Securities for the performance of the engagements in the Magna Charta by King John. Memoirs of all the Securities are given in a similar manner.

'It has already been noticed, on page 16 of the preceding essay, that the name of Eustace de Vesci was intimately connected with the rise and progress of the baronial insurrections of the time of King John. He was the son of William de Vesci, sometime sheriff of Northumberland; and becoming of full age in 1190, the second year of Richard I. he gave 2300 marks, £1531. 6s. 8d. for delivery of his lands and leave to marry, in which year he also paid £12. 3s. 4d. for the Scutage of Wales. At another Scutage made for Normandy in 1196-97, the 8th of Richard I. he rated himself at £24. 6s. 8d.; which however he was acquitted of at that of Scotland, the 13th of John, 1211-12, as well as of the payment for twelve knights-fee in the Scutage for Wales. In the early part of the reign of John, Eustace de Vesci appears to have been employed by the sovereign, since in 1199 he was one of the ambassadors sent to William, king of Scotland; but in 1212, his fourteenth year, he fled into that kingdom with Robert Fitz-walter, upon their being required to give securities for their faithful allegiance. The reason alleged for their conduct was, that John was then an excommunicated man; but though the English possessions of De Vesci were seized upon, and his castle of Alnwick ordered to be destroyed, the whole of his lands were restored, upon the King's reconciliation to the Cardinal Pandulph. Henry Knighton, a canon-regular of Leicester Abbey, who lived in the time of Richard II. relates an improbable circumstance, particularly connected with this baron, wherein he affirms that the incontinence of John was the real cause of the general insurrection of the peerage against him, charging him with violating their wives, and then deriding them. He adds too, that Eustace de Vesci having married a very beautiful wo-

man—Margaret, daughter of William, king of Scotland—who he kept far distant from the court, John became enamoured of her, and carefully considered how he might possess her. Sitting one day at table with the baron, King John observing a ring which he wore, took it from him, and said that he had a similar stone, which he would have set in gold of the same pattern; and having thus procured it, he immediately sent it in De Vesci's name to his wife, charging her by that token instantly to come to him, if she ever expected to see him alive. Believing this message, she speedily departed to the court, but on her arrival there she met her husband, who happened to be riding out; and an explanation having taken place, a disguised courtesan was sent to the King as her substitute. Upon John's discovery of this deceit, he was so enraged that De Vesci fled into the north, destroying some of the King's houses in his passage; whilst many of the nobles who had experienced the same treatment going with him, they seized upon the King's castles, and at length were joined by the citizens of London. As this baron was so inveterate an enemy to King John, it is not surprising to find him a principal leader in the insurrection that followed: he was one of the peers who met at Stamford and Brackley, one of the twenty-five elected to govern the kingdom, one of those to whom the city and Tower of London were committed, one of those excommunicated by the pope, and one of those who invited Louis the Dauphin over from France. His own death was, however, intimately connected with this last rebellious and unpatriotic action. In attending his brother-in-law, Alexander, king of Scotland, to welcome the Dauphin, and to do homage to him for that kingdom, they passed by Barnard Castle, in the bishopric of Durham, then kept by Hugh de Balliol; and approaching too near to see if it might easily be captured, Eustace de Vesci was shot through the head with an arrow from the garrison, in 1216, the last year of the reign of King John. The armorial ensigns which Pine attributes to this baron are Quarterly Or, and Gules; those assigned by Banks are Gules, a Cross Argent; those quartered by the house of Clifford, as heirs general of that of Vesci, were changed into Or, a Cross Sable; but perhaps the most authentic bearing is Gules, a Cross Patonce, Argent. The male line of this family terminated in William, commonly called William de Vesci of Kildare, who was slain in the battle of Bannocksburn, July 25th, 1314, the illegitimate son of William, the grandson of Eustace. The female line ended in Margery, sole daughter and heir to Warine de Vesci, brother of Eustace, who married Gilbert Aton, of Aton in Pickering-Lithe, in the county of York. In 1315, the 9th of Edward II. Gilbert Aton, her great-grandson was found to be the right heir of William de Vesci, and to him the family estates in Yorkshire descended: the marriage of his great grand-daughter Margaret, with Thomas Bromfielde, brought the title of Vesci into the house of Clifford, by the union of Margaret her grand-daughter, with John, lord Clifford, who was slain in the battle of Towton, March 29th, 1461; from whom the present Lord de Clifford, of the family of Southwell, is descended.—Pp. 190—192.

The Dramatic Magazine, No. 5—July.

THIS is a new monthly periodical, confined, as the title imports, exclusively to matters connected with the theatre. It has reached its fifth number. The last contains a summary of the new pieces brought out at the two winter theatres during the late season. From this it appears, that out of sixteen produced at Drury-lane, four had been damned, and eight were highly successful. Of twelve dramas which were brought out on the boards of Covent Garden, three were damned, and three met with great success.

UDE ON LITERATURE.

It has been remarked, by historians of the human mind, that no great intellectual or moral revolution has ever been clearly foreseen by those men whose lives preceded it, or even its importance duly estimated by its contemporaries. Innovators in thought have seldom been considered in their own days as any thing more than pretenders or copyists; and there seems little chance that a great regenerator of literature will ever receive the honour due to him, unless he shall at the same time command the approbation of the world by indisputable supremacy in some other kingdom of renown. We have been long convinced that no reformer of book-craft can hope to receive justice in his own life-time, at the hands of men, unless he shall bring to his mental revolution a name otherwise as pre-eminent as that of Wellington, Mahmoud, or Rossini. That one of those giants should undertake the enterprise of literary improvement, we had little expectation. But while we were thinking with despair of conquerors, prime ministers, sultans, and *maestri*, a greater than them all appears; achieves the task which we feared would necessarily be the origin of contempt and hatred to him who should accomplish it; and guards and establishes his work by a previous fame more unquestionable, lofty, and general than that of statesman or artist. M. UDE HAS WRITTEN A BOOK ON LITERATURE.

The volume of which we speak, for into one volume has this author voluntarily restricted his mighty but modest intellect (like the Astral Angel of the Eastern tale, who, for love of a mortal maiden, confined himself within a pearl of her necklace),—the small though massive octavo lately prepared by M. Ude, resembles in every particular but its subject, the book which is at once the familiar alphabet, the scientific system, and the inspired Koran of Cookery. It has been but very recently completed; and we feel no ordinary pride in stating that its publication has only been delayed in order that 'The Athenæum' might convey to the public the first information of its existence, and a specimen of that unrivalled merit which will soon dawn in its orbéd brightness on the world.

We are happy to know that a taste as severe and exquisite as that which governed the meanest details of the former work, displays itself in every line of the new Institutes. A deep and delicate consciousness of the necessary relation between Literature and Cookery, has produced an appropriate correspondence in the style, arrangement, and decorations of the two volumes. This similarity, however, is always made subservient to the highest exigencies of a philosophic spirit. Of this we find, what appears to us, a beautiful example in the two frontispieces. We scarcely need inform our readers that in the beginning of the 'French Cook,' M. Ude is represented (as copied from a portrait) in furs and jewels, seated on a modern easy chair, and with a social and lively, though considerate temper, sparkling in his eye. In the book which we have the honour of introducing to public veneration, the same great man is exhibited to us as engraved by Mr. Deane, from an admirable bust by Chantry. His countenance is here in some degree idealised, and assimilated to the unearthly beauty of the Phidian gods. We believe that every one will feel with how nice a discernment the painting has been engraved for the book of Cookery, and the bust for the book of Literature.

The world, however, will perceive the force of this beautiful distinction but feebly in comparison with the vividness of our conception of M. Ude's design; for he has placed in our hands a little manuscript treatise on the natural connection between Painting and Cookery on the one hand, and Sculpture and Letters on the other. In this he points out that pictures have always been considered the most appropriate decorations of the eating-room; that the dining-halls of Roman luxury were blazoned with pictures; that the masterpiece of Leonardo Da Vinci was painted on the

wall of a refectory, and that the ancestors of many an English peer smile from the canvas on the prandial enjoyments of their successor. On the contrary, do we not always see the library adorned with busts and statues; and the pen of eloquence, and not the ladle of culinary art, called in to complete the sculptured monument by an epitaph? The Hindoos, little skilled in painting, have no refined dish but curry, and are debarred, by their religion, from eating either fowls or beef; while the statues of Hindostan are innumerable, and frequently elegant, and the books of the Brahmins engage and repay the studies of a Wilkins and a Schlegel. The painter, like the cook, draws the subject of his art from all the regions of nature; the vegetable painted by the one is dressed by the other; the ocean, reproduced by the pencil of Collins, has supplied fish for Mr. Crockford's table; and the oxen, which move and ruminate, and all but low in the pictures of a Ward, are employed to furnish raw materials for the enchanted stew-pan of an Eustache Ude. The man lives in the statue and the book; and the barbarian child, that has never entered either a kitchen or a library, would recognise, by an intuition more certain and precious than the notices of the senses, the similarity, or, in a spiritual sense, the identity, between the varied colours of a dinner-table and those of a picture, and between the pale lights and the dark shadows of a printed sheet and a sculptured marble. M. Ude concludes his essay by showing that the Greeks and Romans, admirable for literature and sculpture, were comparatively unimportant as cooks or painters; but that among modern nations, the arts of the spit and pencil have obtained a development unknown in the times of antiquity. We intend to submit the treatise, of which we have thus abridged a part, to the congenial eyes of the German lecturer on dramatic literature and the British authors of the *Guesses at Truth*.

The title of M. Ude's work runs as follows:

*'The French Man of Letters, a System of Fashionable and Economical Literature, adapted to the Use of English Families. By Louis Eustache Ude, ci-devant Cook to Louis XVI. and the Earl of Sefton; late Steward to the United Service Club; to his late Royal Highness the Duke of York: now Maitre D'Hotel at Crockford's Club, St. James's Street; Doctor of the Sorbonne; Provost-elect of King's College, London; and Author of a Philological and Philosophical Commentary on the Deipnosophists of Athenæus, and the *symposia* of Xenophon and Plato; and of a critical Preface to Napoleon's early work, the *Souper de Beaucaire*. With an Appendix of Observations on the Reading of the Day—New Method of Fashionable Authorship for Boudoirs and Drawing-rooms, as practised by the Writer for many Ladies of Rank—History of Literature.—Rules for Cutting-up—On the choice of Books, &c.'*

This title does not take notice of a preface, from which we make the following extract, and which corresponds to that of the author's work on cookery.

'I have published,' emphatically writes M. Ude, 'a Book on Cookery. Of the indirect effect of that work on the morals, manners, and opinions of England, it is not for me to speak. I leave to others to proclaim that what mechanic's institutes and infant schools are slowly accomplishing for the lower classes, has been at once achieved for the higher by a single volume. It has sufficed for me to contemplate with silent satisfaction the sure predominance of truth over error, of a philosophic spirit over vulgar and confused empiricism; of knowledge complete and harmonious, over the blind guesses of ignorance, and the rude and inconsistent experiments of semi-barbarous kitchens. I have exulted with a tranquil and modest triumph, in the inevitable success of my labours; and it has been to me no slight testimony of the superiority of my favourite art over every other mode of human activity and intelligence, that while years of hostility, and month after month of nightly contest (fatal alike to sleep and eating, to the enjoyment of the bed and the supper-table,) were hardly enough to settle the Roman Catholic question; one retired student brought about by a single

volume a revolution of far higher importance and more lasting benefit. The distinctions of sects are partial and transitory. But every man to live must eat; and to all who eat, cookery is of paramount interest.

'These reflections might have been sufficient for the happiness of many men. To mine they were not so. No sooner had I finished my labours in one department, than I began to turn my eyes to another. And I speedily determined that I would write a book on literature. My views were directed in this line by the following considerations. All that men can know relates either to their bodies or their minds. The material and the spiritual world are the two spheres in which the region of humanity is appointed. Cookery is the highest of physical arts, and Literature of metaphysical. For a man who has laid down the boundaries and laws of the one, it will be a new triumph to develop to the utmost the nature of the other, and to arrange its results in a lucid order. He will thus, as it were, have legislated for both the kingdoms of human nature; and all the phenomena of existence will find their explanation and their rule in one or other of his systems. I foresaw with a rapt and prophetic eye the time when, by my intervention, the twin stars of literature and cookery shall reign over all the host of heaven, and govern by their subtle influence the movements of every thing on earth. If any one shall seek to determine the respective value of these two powers, I will answer that a comparison between cookery and literature is not so much fruitless or erroneous in its conclusions as unphilosophical in its design. Let us imitate the wise caution of Rousseau, who has left it uncertain whether Julie was more admirable a beauty, a letter-writer, or an epicure. By the constitution of human nature we necessarily look at the pen and the fork, as different in their essences no less than in their objects; and to attempt to estimate the relative values in the system of the universe of ink and soup, is to forget that nature has unchangeably decreed the gall-nuts to grow in the forest, and the ox to wander in the meadow. Neither is it allowable to imitate the later platonists of letters and gastronomy, and to trace the ascending series of dishes, till they lose themselves insensibly in the lower regions of literature. The two must be considered as necessarily parallel, and not as possibly one continuous line. We must compare the respective portions of each; look at an *entremet* side by side with an epigram; study a "rump of beef, Flemish way," with regard to a Tragedy from the German, and discover the hidden relation between Tongue à la Maintenon, and Mr. Canning's speeches.

'These were some of the views with which I began my labours; I had the satisfaction of finding, on farther examination, that the method which had been so valuable in the study of cookery, might be applied with equal success to literature. I have read the books of my day, and I have published this treatise. With my two volumes in my hands, I will boldly present myself at the tribunal of posterity; and if any man can assert that he has done more than I have accomplished for the development and gratification of the intellect and the palate, I consent that his name shall be written above mine in the Temple of Memory.'

We proceed to quote some of the directions of 'the French Man of Letters,' and we persuade ourselves that they will be no less satisfactory to the world than those of 'The French Cook.' After a good deal of introductory matter, M. Ude proceeds as follows:—

(To be continued.)

THE CURATE.

(Continued from p. 395.)

AND strange it were had these things not been so!
If men, but nobler beasts, had will to seek
Beyond their world for life and light! They speak
Most vainly, who by pride, or worse pretence
Upborne, contend that in this sphere of sense,
Aught may by men be found, save sense alone:
This tree's a tree, no more; this stone a stone

To the world's eye, to organs made to scan
The things without: it is the soul of man
That through the husk can see the life of things,
Can mark the inborn power from which there springs
The form, and in the ideal world behold
The truth of shades which are before us rolled
From realms of death; each perishable shade
A chain which doth the inward light invade!
Therefore I hold them guiltless whom the power
Of elevated thought found not, ere the hour
When elevation, like a mantle, fell
Upon mankind in Jewry; when to tell
The wondrous tale that through the clouds of death
We rise to truth and glory, which our breath
Blots from us,—Came the Eternal, and bowed down
To suffering and sorrow! We may own
Thus much and hurt no creed! Therefore they toiled
To harmonize with things of sense, and spoiled
Creation of its soul; which some inquired
With strength, perchance from heaven, apart pursued
Unheeded by their kind, in woe and pain
Labouring, till they the diadem did gain
Which good men wear! But we from light who win
Our being, whose life is light, no venial sin
Be sure admit, when with a careless sneer
We read the wondrous lines in which appear
The seeds of that surpassing harvest, given
To famished multitudes from gracious Heaven;
The dim, faint flashes of the day-spring nigh
While yet the east was dark! He thought as I,
And while with awe profound he traced the mind,
Checked in its loftiest flight by links which blind
The wisest men to earth, he saw the might
Of Heaven preserving through the Pagan night
Some pale, dim streaks of twilight; and revered
The ark which bore the precious freight, nor feared
To think him more than man to whom was shown
Such truth. And often when in lighter tone
His wearied mind sought rest, the tale he read
Of him, the Lydian hind, who won the bed
Of a proud queen, by the enchanted ring
He found in the earth, or of the isles which fling
Their dot-like peaks high through the Atlantic wave,
Which rolls in silence o'er the ocean-grave
Of a sunk continent; and oft in thought
Transported, he would ask, if there he sought
For virtue, he might find it? In the halls
O'er which the slimy ooze, and sea-weed crawls,
And in the temples where the water-snakes
Mock the rich flanes, and patient coral makes
His natural floor, blotting the art of man!
Thus for a while the even tenour ran
Of his pure days, fed from the eternal wells
Of poetry, whose lustrous fountain swells
Yet in his soul, for, as I think, he still
Remains what then he was, unchanged by ill.
At length the withering news were brought that death
Had struck his sire, and that the latest breath
Of the old man with anger had pursued
My unoffending comrade. Long he rued
In after life the arts by which impelled
The old misanthrope his gentle son expelled
From the paternal wealth. Now lone he stood
Amidst the world, most rich in the only good
Which never fails young hearts, in hope, but reft
Of all but hope. The lands and house were left
To strangers, 'That the faith might be made strong
In worldly means;' and though this grievous wrong
Was by the law reversed, long time had fled
Ere to his home he came. But he being bred
Mid hardships till he loved them, this small cure
Accepted from a friend, on which secure
From want, in duty's loved pursuits he past
The golden-pinioned hours. But at the last,
Said Ellen, he was married? You recal
My erring tale, I answered; and if all
The good which men may find on earth can be
Made tenfold dearer by the intensity
Of love, there is no ill which doth not breed
Increase, a thousand-fold when in our need
We look for love, and find hate: such, alas!
In manhood as in youth his fortune was!
'Twas at this time that I first fixed my home
In yonder village: then I loved to roam

As now, o'er hill and mead; and oft at set
Or golden break of day, together met,
We stood on peak and headland till his eyes
Ran o'er with joy at sight of earth and skies
Clothed in their wondrous beauty. With what joy
At times like these he marked the jocund boy
Who in ten thousand childish tricks exprest
The new-born happiness which filled his breast:
How kindly would he train my thought, to see
The wealth which science finds in rock and tree!
Then conjured by his art before my eyes
The dim earth-piercing palaces would rise;
Then sparkled with unearthly rays of light
Ice-fretted roofs, begemmed with stalactite;
And diamond-columned caverns 'neath the sea,
Built where the pearl and coral masons be,
Hung their cool roofs before me, bright with streams
Of scattered water-drops alive with beams
Which flung their starry splendour far and wide
Startling the darkness, while on every side
The sea-flowers wove soft wreaths, and living stone
Self-shaped appeared for nymph's or triton's throne!
Then wondrous tales he mixed of plant and flower:
Taught how the fruits which decked our autumn-bower
Had once been seeds, which on the wafting wind
Had floated the appointed bloom to find,
Within whose cradle rocked they slept away
The lagging hours till summer's genial ray
Awoke their life, and gave them power to spring
From their soft couch, the frail and fading thing
Which else in barren beauty must have past
A useless life. And when the rainbow cast
Its twined colours o'er the sky, he told
To my enchanted ears the story old
Of the devouring deluge, and the ark
Which o'er the boundless pool, a lone, frail bark
Bore all mankind; and of the wondrous pile
Which rose on Shinar, when with fruitless wile
Men thought to brave the Almighty. With such talk
This kind instructor filled our lonely walk;
And higher often mingled, when the stream,
The violet, or any common theme
In his most eloquent converse told a tale
Of loftiest import: then on the warm gale
The painted moth that floated was the sign
Of spirits tending to a sphere divine—
And thus the pleasant years went by.

DEATH OF THE AUSTRIAN GIRAFFE.

[The following account of this melancholy event is given in the leading article of a morning paper. We borrow it without any scruple; because, as there is no human being who does not read the ———, or at least ought not to read it, our readers will merely be presented a second time with intelligence and opinions which must now form a part of the national mind. The translations from the French journals, we beg leave to say, are all taken from that popular source; indeed, nothing but the classical purity which distinguishes that paper could justify so literal a version of French idioms.]

On Monday evening an express was received from our ambassador at Vienna, announcing the melancholy intelligence of the death of the Giraffe, which was sent to the Emperor of Austria by our ally the present enlightened Pacha of Egypt. As we have always considered the donation of these animals to the three great potentates of Europe as an act which had an important influence on the balance of power, we are particularly sorry for an event which may give the ambitious Muscovite any hope of disturbing the equilibrium of Europe, and facilitating his unprincipled designs of aggrandizement at the expense of our ancient and valued allies, the Mussulmen. We should fear also, that this untoward event might tend to disturb the balance between the two remaining Giraffes. In the lamentable absence of a free press no accounts from Austria clear up the mystery of his fate. Surmises are numerous, and several of them have an air of probability; but it would be better to make the matter certain. Let our ministers direct Lord Cowley to demand a specific answer from the Emperor himself. The Emperor had better give us a straightforward answer. If he does not, if he trifles with us, he is not safe on his throne. Let him take warning—we have said it.

At a cabinet council, which was held immediately, and at which, in spite of all assertions to the contrary, we fearlessly maintain that ALL THE CABINET MINISTERS ATTENDED, it was determined that the news should be conveyed to the Giraffe at Windsor. Congeniality of intellectual construction pointed out Mr. ——— as the fittest medium of communication with an irrational being: and that eminent statesman discharged the task with his usual address. The interesting foreigner received the news with the most exemplary resignation, and consoled himself after his accustomed manner, by eating some gingerbread-nuts. From what we could collect, he entertained no alarm respecting his own fate, and appeared fully sensible of the superior advantage which he enjoyed in living under a constitutional government.

Our volatile neighbours, the French, appear to have been much excited by the news, as will appear from the following extracts from the Paris papers just received:

EXTRACTS FROM THE FRENCH PAPERS. (*Messenger des Chambres.*)

'JULY 3rd.—We insert the following advices from Vienna:

'VIENNA, JUNE 19th.—They say the Giraffe which has long been in a very delicate state of health, is in great danger. Strict orders have been issued to prevent any conversation on the subject. It is said that something unexpected will transpire.'

'JUNE 20th.—Yesterday there was a meeting of the court physicians, at Schönbrunn. The result was by no means calculated to still the alarm entertained respecting the health of the Giraffe. Couriers were sent off to the commanders of the Hungarian regiments in Italy.'

'JUNE 22nd.—The Crown Prince demanded admission, yesterday, to the sick-bed of the Giraffe. Will you believe it? He was refused. Metternich's audacity is inconceivable.'

'JUNE 23rd.—The dreadful news is no longer a secret.—The Giraffe is dead. Several arrests have taken place in consequence. It is rumoured that the fatal event took place on Saturday, and has been kept secret in order to further some intrigues of Metternich. What effect will this unexpected catastrophe have on our relations with the Pacha?

(*Gazette de France.*)

'JULY 3rd.—The secret conspiracy, which by its dark machinations prepares the overthrow of the altar and throne, has consummated another crisis of the infernal tragedy! Another victim is fallen! Another martyr swells the bloody list of the holocausts of Liberalism! The Giraffe of Austria is dead! A strict silence is preserved respecting the cause of this catastrophe. Some rumours have even dared to point out the illustrious Metternich as the assassin. Where will the innocence of these scelerates stop? But it is vain for the bravoes of a desperate cause to trust in the confusion of mind caused by the mist of falsehood which they have raised. The authors of this crime are known. Let them tremble! for Europe shall know that the infernal agents of an imbecile administration, which tarnishes the honour of the descendants of St. Louis, have perpetrated a foul murder, in order to accustom the canaille to deeds of blood, and prepare the subversion of all monarchy and religion.'

(*Constitutionnel.*)

'JULY 4th.—Chamber of Deputies. Presidency of M. Royer Collard.

'The discussion of the supply of the Navy was resumed. Several speakers having delivered their sentiments,

'The PRESIDENT said.—The minister of the Interior demands the parole. (*Strong sensation.*)

'M. MARTIGNAC.—Penetrated with the most profound grief, I announce to you a fatal event. The rumours which have agitated the civilized world are but too true. The Ambassador of Austria has announced the death of the Imperial Giraffe.

'Murmurs of grief.—M. Martignac bursts into tears.—All the members rise.—The Chamber presents an animated spectacle for a quarter of an hour.—Several deputies rush up to M. Roy.—"M. Portalis is absent."—The right of the left section of the centre right preserve an immovable aspect.—M. Benjamin Constant goes out to put on his costume.—The

noise subdues.—A morne silence prevails for eight minutes.

M. ROYER COLLARD.—The Minister of the Interior will resume his report.

M. MARTIGNAC.—Yes, Messieurs, you feel as I expected. The expression of your sentiments does not impair the dignity of the Chamber. (*Bravo!*) But it does not agitate itself here of regretting irremediable evils. It is necessary to take measures for the future. (*Prolonged bravos.*) We must recollect that we too have a Giraffe: and that we must preserve the links which bind us to the rulers of Egypt. (*Bravos on the right. A voice from the extreme left.*) "*M. the Minister is a Turk in heart.*" When the enlightened Pacha of Egypt determined to amalgamate the Mussulman character with the civilization of Europe, he sent three Giraffes to Europe. He honoured with these rare presents the illustrious houses of Hohenzollern, of Guelf, and of Bourbon. An unexpected visitation has deprived the descendant of Rudolph of Hapsburg, of the sacred consolation of administering the rites of hospitality to an illustrious stranger. It would be wicked for us to conceal the news that we have received from the Cabinet of St. James's.—(*Strong sensation.*) The air of Windsor has affected a constitution which nature had adapted to an African temperature. The Giraffe of England has experienced debilitation of knees from the British malady of the country. Yes, Messieurs, he has the gout,—the *affroyable* gout—and he has shown a strong penchant for suicide.

Several voices from the right.—Aha! Messieurs les Anglomanes! voilà les effets d'une Constitution!

M. KERATRY.—Non, non—c'est le droit d'aïnesse! (*Bravo!*)

M. MARTIGNAC.—What then must be done? I hear you anticipate my reply. Every thing must be done, Messieurs, to preserve the honour of France, and console the descendant of the great St. Louis. The supply of biscuits for the Giraffe is not sufficient. (*Murmurs.*) I assure you such is the case. Let us increase it; and though we may thereby make a temporary addition to the burdens of the nation, I trust to the liberality of the Grand Nation, which has always prided itself on setting an example to Christendom of the generous discharge of the sacred functions of hospitality towards the distinguished strangers who have visited its shores, and thereby extended its renown to the furthest extremities of time and space.

(*This peroration of the minister excited a deep feeling. Fifty-seven deputies rush to the tribune. A scene of confusion ensues.*)

THE PRESIDENT.—M. Syriens de Marinhac has the parole.

M. S. de M.—Ah! my God! I have not my costume. I will speak without it.

THE PRESIDENT.—M. de Marinhac I call you to order. The law forbids you to speak in an improper dress. The law must be respected. *Le Général* has the parole.

LE GENERAL.—I invoke the names of justice, of glory, and of France. (*Deep attention.*) The sighs of the veterans who have covered themselves with wounds and laurels accuse us of inattention to the honour of Frenchmen. Yes, Messieurs, my heart is torn with unutterable anguish when I utter the mournful words which truth sends forth from my bosom.—The honour of France is tarnished.

(*Loud cries of yes! yes! from all parts—and "It is the imbecile ministry which has done it."*)

M. le GENERAL.—No, Messieurs, it is not the ministry. Truth reigning eternal in my heart compels me to say it is yourselves. (*Deep sensation.*) It is you who have pulled down your country, from the high station to which it was raised by the immortal Napoleon.

(*No! No! He was a tyrant, a regicide.*)

M. le GENERAL.—I know Messieurs, that I tread on dangerous ground; but truth compels me to do justice to the shade of a great hero. He would not have turned a deaf ear to the sighs of his invincible soldiers. What would he have done? Can you doubt, Messieurs, to what he would have been impelled by his love of glory, of humanity, and of science? That great man wished to raise France to the pinnacle of glory. He wished to make it the only repository of science. He wished to bring to a common theatre all the noble monuments of art and na-

ture, which chance had scattered among nations which were unworthy of them. Can you doubt, then, what that great hero would have done? Can you doubt that he would have demanded the giraffes from Austria and the proud islanders? Can you suppose that, if madness had led to a refusal of his just demands, he would have hesitated to vindicate the national honour by arms? He would have led forth his legions, his invincible legions, to the field of honour. The eagles of France would have spread their victorious wings on the banks of the Danube and the Thames. Ten million deeds of heroism would have honoured human nature;—a million warriors would have inscribed their glorious names on the book of honourable death;—a thousand fields would have been rendered illustrious in the page of history by as many sanguinary triumphs;—and millions of families would have had the sweet regret of mourning their heroic brothers and parents, who had sacrificed their lives for the honour of France. Doubtless, the rare genius of that hero would have been again triumphant. Doubtless, the leopard and the black eagle would have crouched before him, and yielded the beautiful beasts of Africa to the moral influence of victory. The citizen would reflect on the glory of his country when he looked on the living trophies in the Jardin des Plantes, and the trumpet of fame.—Ah! Messieurs! what have we not lost in the loss of a hero! That his name may be blest by the people whom he honoured, and the veterans whom he led to victory! That his bright example may be imitated by a degenerate people! It is not yet too late. I propose war with Austria in order to administer some consolation to the wounded honour of our country, and vindicate the outraged feelings of Europe, Christendom, and Natural History. (*The Chamber is stupified with admiration. Murmurs of applause burst out.*)

M. SYRIENS DE MARINHAC.—Yes, I perceive it. In the accents of the honourable deputy, in the words of M. the Minister, in the reiterated bravos of two desperate factions, I hear the tones of anarchy—the distant mutterings of the counter-revolution—

Voices from the left.—Aha! always the counter-revolution!

Voices from the right.—Bravo! Bravo!

From all parts cries of "Question! Question! Aux Voix!"

M. S. de M.—I speak to the question—

Voices from the left.—No, no! What is the question?

M. S. de M.—The question is, whether we shall respect the king and religion—

Voices from the right.—Yes, yes! bravo! live religion.

Some on the left.—No, no! that is not the question. It is you who dishonour religion, and endanger the monarchy.

M. S. de M.—No, scélérats of liberality, it is you. I speak to the question—what is the question?

From the left.—Aha! the Jesuit! he does not know. A deputy.—It is the war with Austria! (*Cries of Aux Voix.*)

Another.—No! it agitates itself of the Marine. (*Aux Voix.*)

Another.—No, no! it rolls on the Catholic religion. (*Aux Voix.*)

Another.—No, no! it is the king! the giraffe! (*Aux Voix.*)

Several others.—No! it is the charter. (*Cries of Vive la Charte.*)

(*M. Charles Dupin rushes to the tribune. M. S. de Marinhac tries to keep him out, and exerts force. Blows of fist interchange themselves. Seven or eight ultras pull M. Dupin by the skirts of the coat. A dozen liberal deputies endeavour to pull M. S. de Marinhac out of the tribune by the collar. The President agitates his bell.*)

Cries of "Order!" "respect the President!"

From the right.—No! he is an atheist, a liberal!

M. S. de Marinhac.—Messieurs, the sacred cause of religion—

MR. C. DUPIN.—The increase of knowledge and liberty—

From the right.—Down with knowledge and liberty!

A liberal Deputy to M. S. de Marinhac.—You are an ultra, a beast, a slave, a Jesuit, one condemned to the gallies, (forcé.)

A royalist Deputy to M. C. Dupin.—Aha! atheist! liberal! traitor! scelerat! thief! incendiary! assassin! one condemned to be broken on the wheel! (*roné.*)

M. the PRESIDENT.—Behold words which it seems to me are a little strong! Messieurs, recollect the dignity of the Chamber—

No! no! you are a liberal! an ultra! unjust!

(*The tumult is at its height. All the members beat themselves. The question of adjournment is put and carried. The sitting is closed.*)

We are sorry to see that our neighbours understand liberty so little. Their infidelity and ferocious democracy are exhibited in their lavish abuse of our happy island, and their admiration of the cowardly tyrannical Corsican whom we beat at Waterloo. Why their deputies set to a-beating themselves at last (we cannot misunderstand "*se battent*") seems rather inexplicable. If they wanted a beating, they might easily get it by a little more insolence to us. The victor of Waterloo will not tarnish in the cabinet the honours he has gained in fields of blood. We have still the gallant fellows who beat ten times the number of the *invincible heroes*, and the moral superiority which those who live on beef and ale must always have over those who get nothing but frogs and vinegar.

TIMBUCTOO.

THE Swedish Consul at Tripoly, M. Graberg de Hemso, justly presuming that the result of the inquiries respecting Timbuctoo, of a person who, like himself, had resided so many years in Morocco and Tripoly, would be interesting to European readers, has addressed a paper on the subject to a friend at Florence, who procured its insertion in the "*Antologia*" of January last. Mr. Hemso first examines the etymology and pronunciation of the name of the city, and seems to doubt the correctness of those who have derived it from *Tin*, a dwelling, and *Buctu*, which, in the language of the country, is the proper name of a woman, from whence it is inferred that the place took its name from some female of great celebrity among the Africans of the Interior. To this, Mr. Hemso objects that in his frequent intercourse with Moorish and Arab inhabitants of the interior of Africa, he had never met with one who could give him any account of the existence or history of such a personage. So far is certain, he says, that the Arabs pronounce the name Tun-buk-tu, and have done so at least since the fourteenth century; for the celebrated African traveller of that epoch, Mohammed Ibn Battuta, has expressly remarked that the first syllable of the word consists of the consonant Ta T, and the vowel Dhomma U, and that it is pronounced tan and not tin.

The population of Timbuctoo, says Mr. Hemso, cannot exceed 100,000 souls. Abd-es-Salam Schiabini, who visited the city about forty years ago, estimates the number of inhabitants at 50,000; later travellers reckon it considerably less. A merchant of Gadama, who has made several journeys to the city, who possesses houses, wives, and slaves there, and who has himself at times dwelt a whole year in the city, positively affirms that the population is not greater than that of Tripoly. In this, however, he is supposed to comprise only the natives and residents, and it is inferred that the number of inhabitants is much greater at the periods when Timbuctoo is filled by the caravans which flock thither, at certain seasons, from all parts of Africa.

There appears to be no doubt that the government of Timbuctoo was independent, and vested in the hands of the native negroes and pagans until it was subdued by the Fellatas, a new warlike nation, which at present acts a conspicuous part in central Africa. When Schiabini made his journey, he found Timbuctoo a dependancy on Houssa. At a later period it was under subjection to the King of Bambarra.

The Dscholibab (Joliba), or the Nile of the Negroes, does not flow by Timbuctoo. The celebrated traveller, Ibn Battuta, had already determined this point so early as the beginning of the fourteenth century. Another river, however, which, in the lan-

guage of the natives, is called Gain, passes near the city in its course, and falls afterwards into the Joliba.

Timbuctoo is not surrounded with walls, nor does it appear that the city ever had walls. The houses are constructed merely of a single story, and are wholly devoid of regularity and symmetry. The Mahometans dwell in suburbs of their own, and were not allowed to settle in the town.

The account of Benjamin Rose, says M. Hemso, as is remarked by Mr. Dupuis, is the best yet given of this city, although the author of it had never visited Timbuctoo himself, but had derived the materials of his description from frequent communication with those who had been there. Some, perhaps, he adds, may justly give the preference to that of Schiabini, the succinct brevity of which deserves more credit.

The dominant religion in Timbuctoo was paganism, a few years ago, and Mr. Hemso expresses a doubt whether the Fellatas have so soon accomplished the establishment of the laws of the prophet in its place. The women of Timbuctoo, according to M. Hemso, are in general handsome, and seem to enjoy the most perfect liberty. Schiabini positively affirms that this is the case, and he is corroborated by the personal testimony of a living witness, the merchant of Gadama, already mentioned. Mr. Hemso concludes his account by saying that his esteemed friend, Major Laing, was certainly the first European traveller who had succeeded in reaching Timbuctoo.

THE DRAMA.

King's Theatre.

ONCE more 'Cenerentola'! There is something so exquisitely agreeable in this opera, that we can never witness it without being put in good humour, nor think of it without being inclined to prattle about it. Therefore, although it has already been the theme of our criticism more than once this season, we cannot resist the temptation of saying one or two final words, to serve as prompters to our memory when the season shall be over.

The excellence of this representation arises from a combination of those three stars, Mademoiselle Sontag, Signori Zuchelli, and Donzelli. The failure is the substitution of Galli for a singer of more comic and versatile temper. The part of Dandini, though not so agile and lively as the average of buffo characters, nevertheless requires a sedate humour, a compressed and half dignified absurdity, which Signor Galli is utterly without. He may improve, he has improved in the articulation of the music, but he cannot become an actor, unless it be of serious parts. Our praise has been lavished on Zuchelli's *Don Magnifico usque ad nauseam*. It is, however, so completely his masterpiece in comedy, that some stress may be laid upon it, and be excused. The commencement of the air, 'Miei rampolli femminini,' actually teems with richness of comic expression; and although, perhaps, there is something like a comparative weakness towards its close, yet there is exhibited throughout sufficient force and nicety of execution to set this singer at the head of his bass fraternity. We have seen the scene between him and Dandini, in which the discovery is made of the cheat put upon him, so much better filled out by Pellegrini than by Signor Galli, that a sense of disappointment unavoidably steals upon us despite our excessive admiration of one of the principals in it, and no mean approval of the other. The impatience of the Baron to know the destiny of his daughters,—the tantalising delay of the satisfaction required,—the gradual perception of the plot, and his aristocratic disdain of the fellow whom he just crouched to as a sovereign prince,—this was capital, and cannot fail to be long remembered. His share in the concerted pieces is effective as usual; and this reminds us of the 'true prince' and his sweet lady love, whose celebrity in their respective parts is assuredly not undeserved. The former supports the interest of an *amorous*, with a most gallant bearing; and it puzzles us to think

why 'instinct' should not have detected him, according to Falstaff's code, much earlier than he is really undisguised. But for Cenerentola, how wise and happy a monarch was he, who could steal such a one from her dust and cinders! The singing of Mademoiselle Sontag is more liquid and silvery than ever. From the simplicity of 'Una volta c'era un Re,' to the flowery ornament of 'Non piu mestu accanto al fuoco,' the intermediate styles, as well as the extremes, are most true in point of tone and expression, most delicious in sentiment, most wonderful in execution. And then her portion of the quintett, 'Nel volto estatico,' and of the sestett, 'Questo è un nodo avviluppato,' what can be more masterly, more prominent without destroying the unity of the whole, more marked without becoming ostentatious? In the first, we never remember any thing sweeter than her falling into the air, and leading it in the high regions of her voice, a glittering beacon to the others, as they accompanied her along the more terrestrial levels. Into the harmony, complicated as it is, of the sestett, her voice winds and flies along with the utmost certainty, and lightness, and beauty. It resembles the casual bits of sunshine floating here and there on a wavy sea, beneath the uncertainties of a cloudy autumnal sky. Bright and lovely indeed is the display of so much purity in style, mingled with such vigour of organic power. On Cenerentola her fame may well be rested, without going further or higher.

English Opera House.

'THE Sister of Charity,' a new melo-drama produced at this theatre, on Thursday, was completely successful. It seemed to have been written expressly to bring into contrast the opposite powers of those two admirable performers, Keeley and Miss Kelly; and to those who remember the 'Noyades,' and 'The Serjeant's Wife,' of last season, composed exactly on the same principle, it will be sufficient to say, that 'The Sister of Charity' is as good, if not better, than its predecessors of last year, and its effect equally confounding to the feelings of the audience. People are obliged, indeed, to laugh with one eye and cry with the other; and to observe this conflict of smiles and tears, on the countenance of a pretty neighbour, is almost as interesting as the performance itself. It is owing to the excellent management of Keeley, and his very quiet and subdued style of humour, that the two feelings are made to harmonise rather than clash with each other. The following instance will illustrate this strongly, and serve at the same time, with one or two additional circumstances, to tell the story. An officer of a party of Austrians, demands of Paulo, a peasant, (Keeley) why he has intruded himself so near his lines; he answers, 'Why, Sir, if it please your honour, I came to see my sister Nannetta the poor girl who was taken prisoner by your brave soldiers for carrying bread to the starving smugglers, led out to be shot, at twelve o'clock, to the minute.' The tragic tone of mimicry in which the last words are pronounced, is irresistible in two ways at once. Sister Ursula, a nun, the reputed sister of Nannetta, but in fact her mother by an Austrian of rank, whom she has not seen for seventeen years, recognizes in Captain Weimar, one of the officers of the Austrian detachment, her seducer, and the father of the unfortunate girl who has been condemned to almost immediate execution. This character is of course personated by Miss Kelly, and in a powerfully affecting scene, she discovers herself to Weimar, for the purpose of obtaining his interference on behalf of their child. After a vain attempt to move the sternness of his superior officer, who will only grant him an hour's respite, Weimar sets out to obtain a pardon, in that interval, from head-quarters. In the meantime Sister Ursula obtains an interview with the prisoner; prevails upon her to escape disguised in the nun's dress, and remains for execution in her stead. While this has been doing, Paulo, having eluded the vigilance of a sentinel, by a most comical ruse de guerre reaches the smugglers, whose hiding-place was inclosed by the Austrian lines, and leading

them down from the hills by an unknown path, secures the person of the Austrian commander, who had taken up his quarters in Paulo's cottage. This inflexible worthy being compelled to write a warrant of reprieve, in a language which the peasants do not understand, commands the instant execution of the party who bring it. These are Nannetta and her lover, one of the smugglers, who arrive just in time to save Ursula's life at the sacrifice of their own. In a heart-rending scene, where the soldiers endeavour to separate Ursula and her child, the moments are protracted until the arrival of Weimar, whom accidents had delayed, with a pardon.

It will be seen, from this imperfect outline, that there are several situations peculiarly suited to the exhibition of Miss Kelly's powers; and though the language of the piece is by no means eloquent of itself, still it is sufficiently simple and unaffected to become, in the utterance of Miss K., eloquent and affecting to the last degree. The most striking situation was the one which, in any other hands, would have appeared too common-place to listen to at all; it was where with difficulty she prevails on Nannetta to escape in her dress, and afterwards from a window of the prison watches her faltering departure beyond the line of sentinels. It is even better on the whole than a scene it reminded us of in the 'Serjeant's Wife,' which we remember was almost too horrible and blood-chilling for a mind the most melo-dramatically disposed. There is certainly nothing on the English stage, and in the absence of Pasta, nothing in England, to be compared with the talent and exertions of this inimitable tragic actress; and the English Opera House will be long endeared to our recollections, as the theatre she has particularly chosen for their display.

It would be the greatest injustice not to notice Miss H. Cawse's performance of Nannetta; she sang her little song 'I won't be a Nun,' admirably, and was throughout as interesting as she could possibly be in the presence of Miss Kelly.

Another piece was brought out at this theatre in the beginning of the week, under the title of 'The Middle Temple, a new Comic Operetta.' We understand it is by no means new, though we confess never to have seen it before; we can answer for it also, that it is not an Operetta; yet, it certainly does justify the appellation of comic. In this regard, we need scarce say more for it than that two of the characters are played by that merry little couple, Keeley and his bride, (late Miss Goward); who indeed are the life and soul of all the comic entertainments at this theatre. We think, indeed, the manager scarcely acts fairly by Keeley, to work him so hard as he does at present: he bore a prominent part in all the three performances of Friday, and being encircled in a dance in the Middle Temple, the poor little man was obliged to appeal to the humanity of the audience by saying 'he had done a great deal already that evening, and had a great deal more left to do,' which to those who took all the circumstances into consideration, seemed a much more comical speech than any in the 'New Comic Operetta.' It succeeds, however, and deservedly.

Haymarket.

A new piece, in one act, was brought out here on Thursday, called 'Manceuvring,' translated or taken (whichever the term may be) by Mr. Planché, from a French piece with a similar title, 'Le Diplomate.' The plot is common-place, and otherwise very bad; the dialogue tolerably well written; the acting altogether good; but the reception the whole met with much better than either the composition or the acting deserved. A mischievous valet outwitting a cautious old gentleman on behalf of an imprudent young one, with a lady strictly guarded by one party and to be won by the stratagems of the other, is a subject which seems to have been universally interesting from the days of Menander down to the present, but on which we conceive every possible combination of incidents has been long since exhausted.

Yet such is the story of Mr. Planché's new piece, and such are four out of the five characters which kept the audience of the Haymarket in good humour on Thursday, notwithstanding the re-action of two other 'weary, stale, flat, and (we should hope) unprofitable' pieces which wore out the remainder of the evening. It is a lamentable state of things at our theatres, when we are obliged to seize with avidity such slender opportunities of giving vent to our cheerfulness and hearty disposition to laugh. To say that Cooper surpassed himself as the Count de Villa Mayor, the gentleman to be deceived, is hardly praising him sufficiently on this occasion. Vining was also good as Finesse, the Figaro of the piece; but the person who did most in redeeming us from melancholy was Mrs. Humby, in the character of a pretty (very pretty) but selfish and intriguing milliner, who almost persuaded us by her excellent acting (we suppose) that her part was really a well-drawn one, and characteristic of that class of her sex which she represented. A Mr. Brindall (whom we never saw before) played the part of a young gentleman in what we thought at first a gentlemanlike manner; but we find that though very easy to act the gentleman in looking angry or surprised, it is a matter of much more difficulty to look happy and pleased as a gentleman should do; accordingly, the repeated vows of Frederick to his fair one and her father on the consummation of his hopes, betrayed him to be no adept in that way. Mrs. Ashton, having nothing to do but look pretty, played her part indifferently well.

FOREIGN PLAYS IN PARIS.

A PROJECT is said to be in agitation in Paris, for the formation of a joint establishment for representations in the English, German, Italian, and Spanish languages. As to the performances of the three first of these tongues, no great difficulty seems to present itself: actors are probably more likely to be found than audiences; but whence a Spanish company is to be procured, we confess ourselves at a loss to divine. In the Peninsula itself, even tolerable performers are exceedingly rare: the profession is still regarded as vile, and is only followed by persons devoid of family-respectability, and education. The only three whom we can think of, who have appeared in our days at all likely to attract an audience in such cities as Paris or London, are now either dead or incapacitated. These are Rita Luna, Maiquez, and Quesol. The last was an excellent enactor of what, in the language of the country, are called the *gracioso* parts, humorous characters, valets, buffoons, &c.; he died in harness a few years since, at a very advanced age, and exiting to the last the admiration and applause of his countrymen. Maiquez was tragic, and was eminent in the high characters of the old Spanish plays. He was a man of very low extraction, but was considered in Madrid an excellent performer. The humbleness of his condition, or the low estimation in which men of his calling are held in Spain, did not shield him from the tyranny to which all ranks and classes have fallen victims in that distracted country. Suspected of liberal principles, he became an object of jealousy and persecution to King Ferdinand, and was banished from the capital. Under this infiction he died, some time between the first restoration and the proclamation of the constitution. Rita Luna was a female actress of extraordinary natural genius. Her excellence also consisted in the representation of the heroic characters of the old Spanish plays. Her powers were entirely derived from herself: she could neither read nor write; and in order to learn what she had to declaim, was obliged to have her parts read or repeated to her. She was living three years ago, but retired from the stage in consequence of old age. We have not since heard of her death.

The representation of Spanish musical pieces forms, we conclude, no part whatever of the scheme of the Parisian projectors. Any thing like theatrical music from Spain must be despaired of, so long

as the present state of things exists. It is well known, that all eminent composers are monopolized by the clergy to write church music: they are paid the best prices, but are laid under strict injunctions not to engage in the composition of any thing *profane*.

DIMENSIONS OF THEATRES.

THE following dimensions of several of the principal theatres of Europe may be fully relied on: they are from original measurements, with which we have been favoured by an artist of acknowledged talents. We doubt not that they will afford acceptable information to our readers:

	Naples Teatro S. Carlo.	Milan Teatro alla Scala.	London Covent- garden Theatre.
	Ft. In.	Ft. In.	Ft. In.
Depth from the front of the stage to the back of the pit	79 4½	77 5	52 9
Depth of the pit - - -	68 6½	64 7	44 3
Depth from the scenic aperture to the back of the pit	99 1½	96 5	63 5
Greatest breadth of the pit -	75 0½	71 5	51 0
Breadth of the scenic aperture	51 9½	50 2	38 4½
N. B. At Covent-garden Theatre this aperture, on ordinary occasions, is diminished more than two feet on each side by a sliding pilaster; no such contrivance exists in the other theatres.			
Breadth at the front of the stage	53 10	54 8	42 9½
Breadth of the stage behind the scenes - - -	115 0	121 3	
Depth of the stage - - -	147 8	149 5	
Total area from the scenic aperture to the back of the pit	Sq. feet. 6068	Sq. ft. 5701	Sq. Ft. 2772

At S. Carlo there are six complete tiers of boxes, each tier containing thirty-two boxes.

The boxes are each six feet nine inches wide.

At La Scala there are six complete tiers of boxes, each tier containing forty-one boxes.

The boxes are each five feet wide.

At Covent-garden there are twenty-eight boxes in each tier.

The largest theatre in Europe, however, is that at Parma, which, according to the estimate of the Ciceroni, of that city, is capable of holding 9000 spectators. It is no longer used.

The following are its exact dimensions, furnished us from the same quarter, to which we are indebted for the particulars above given of the other theatres:

GREAT THEATRE AT PARMA.

Depth from the front of the stage to the back of the pit - - - - - 152 7½

There is no proscenium.

Breadth of the pit - - - - - 90 3

Breadth of the scenic aperture - - - - - 40 0

Depth of the stage - - - - - 125 4

FINE ARTS.

Portrait of His Majesty in the Robes of the Garter; engraved on Steel by Mr. Hodgetts, from the Original Picture by Sir Thomas Lawrence, P. R. A. Colnaghi. London.

THE picture from which this engraving is taken is one of the most successful efforts of Sir Thomas Lawrence in the art of portrait painting: it is one of those performances, in short, in which the talent of conveying a faithful likeness is very happily united with the exercise of the imagination to produce a good picture without the sacrifice of personal identity. It is, in fact, the historical portrait of the present King; that resemblance of his Majesty, in which posterity, when they shall read, as they doubtless will do, that George IV. was the most polished and the handsomest prince of his day, will find a full corroboration of the record of the historian. Nor is it to the United Kingdom only that this splendid portrait will have preserved the memory of the lineaments of his Majesty: numerous repe-

titions have been made of the picture, to be presented to several crowned heads; and it is one of these repetitions which, having been transmitted by the King to Pope Pius VII., has an honourable place in the august Museum of the Vatican.

The particular painting, however, from which the engraving we are noticing is taken, is that expressly executed at the King's command, for the city of Dublin, and the publication of the engraving, at this moment of concession by his Majesty to his Catholic subjects of the sister kingdom, of a boon so ardently desired, and which had been in vain implored from his predecessors, is exceedingly politic and well timed.

Mr. Hodgetts, in the engraving, seems to have been influenced by an equal *con amore* feeling to that which inspired the pencil of the painter. The plate is most splendid, bright, and expressive; the drapery is executed in most effective style, full of powerful contrast; the figure is elegant and noble, and the head beaming with life and animation, and the gracious affability of a happy monarch. As the original is a master-piece in portrait painting, so is the plate a triumph in mezzotinto engraving.

SALE OF THE DRAWINGS OF THE LATE MR. BONINGTON.

AMONG the most interesting occurrences connected with the fine arts, which have happened during the present season, was the sale, last week, of the pictures, sketches, and drawings of the late promising artist, R. P. Bonington. The sale produced, altogether, upwards of £2250, and the avidity which was shown to possess the simplest works left by the deceased, and the prices to which his least important productions were raised by competition are quite remarkable. In most cases, no doubt, this eagerness originated in a true love of art and a well-founded admiration of whatever is excellent; in some, however, it too evidently proceeded from a less worthy motive, from affectation or caprice, or the mere blind desire to follow the fashion; for, on what other principle can it be explained, that the mere tracings of this artist, as memoranda or studies for his own use, and which might have been made just as well by any body else as by himself, were anxiously bid for, and run up to an extravagant price.

Among the most extraordinary, but, at the same time, most legitimate sums given for drawings, was that of £26. 10s. for a pencil and chalk view of the 'Ecole des Arts, Paris.' The drawing, however, was exceedingly clever and spirited, and, under all circumstances, well deserved the price at which it was knocked down. The painting in oil, which attracted so much attention in the exhibition last year, where it received very great and merited applause, 'Henry III. of France, receiving the Spanish Ambassadors,' was bought in at £84—a large sum, certainly, were the dimensions of the picture to be taken into consideration in such a case. The other pictures, for which the highest prices were given, were the 'Views of the Maffei Palace in Verona,' in oil, £73. 13s. 6d.; 'Part of Genoa and the Bay,' an oil sketch, £31; pencil sketch, 'View of Abbeville,' on coloured paper, £20; 'Mother and Child at Prayer,' cabinet picture, in oil, £105; 'Picture from Quentin Durward,' also in oil, £14. 10s. The Marquis of Lansdowne and Sir Thomas Lawrence were among the company present, and purchased largely.

NEW MUSIC.

'Oh, can I think of Days gone by,' as sung by Signor Velluti, written composed, and dedicated to him, by Thomas Welsh. Harmonic Institution.

THIS ballad has attracted considerable notice, as being the first English song publicly performed by Velluti. It presents a familiar, quiet, and unpretending melody, written (with the exception of the embellishments) within the very limited number of only eight notes, the E on the first line and fourth space, and is, therefore, easy to be compassed by

almost any voice. It consists of but one brief verse, each strain being written twice. A second verse might with great propriety be added to it.

Here's celebrated Quadrilles, including the admired Gallopade Cotillon, and the favourite Maracha, as danced at Almack's and the Nobility's Balls, composed, arranged, and respectfully dedicated to Mrs. Della Reive, by Joseph Hart. Mayhew and Co.

THESE beautiful airs, in the original edition of Herz, are difficult of execution, diffuse in their arrangement, (all the various strains necessary for dancing to as a quadrille being written out at full length,) and requiring a piano forte with the higher additional keys up to F. Hart has, therefore, simplified them, has brought them down to the level of his former arrangements, and rendered them more tangible for the multitude; but, like all abbreviated works, they are any thing but improved by his adaptation. However, they are much easier to be understood and performed, and may, therefore, be more generally useful.

'The Archer Boy,' the celebrated Cavatina, sung by Miss Love, in the historical play, 'The Partisans,' performed at the Theatre Royal, Drury-lane; written by Mrs. Cornwall Baron Wilson, composed by John Barnett. Barnett and Co.

A VERY pleasing and interesting trifle, quite in Barnett's best style of playful writing: extremely easy to be sung, the highest note being only E in the fourth space, and the lowest C below the stave; thus suitable to voices of low and moderate compass. It is an *allegretto scherzosamente*, in G, 3/4 time, much resembling in character Barnett's popular airs, 'The Light Guitar,' and 'Rise gentle Moon;' and, as sung by Miss Love in the drama, is very pleasing, and (we believe) was always encored.

Bochsa's Rondo, (a la Russe), arranged for the Piano Forte, and dedicated to Mr. W. S. Conran, of Dublin, by Augustus Meves. Cramer and Co.

A GAY, cheerful, and characteristic rondo vivace, in A, so much in the manner of Meves, that we should not have imagined it a mere adaptation.

'Gems à la Masaniello,' a Fantasia for the Piano Forte, in which are introduced the most admired Subjects from Auber's celebrated opera, 'La Muette de Portici,' by T. A. Rawlings. T. Welch.

A CLEVER, well-imagined, and brilliant effusion, possessing the most desirable qualifications of being shewy and pleasing without difficulty. A *moderato e maestoso*, by way of introduction, (of two pages in the key of E flat), precedes the 'Chœur du Marché;' this, by an appropriate cadence, leads into the very beautiful andante, 'Saint bien heureux;' and 'The Tarentelle (in G minor and major) is followed by the favourite 'Barcarolle,' (also in E flat), as a finale. The whole presents a very desirable, interesting, and brief piano forte piece, of excellent pretensions.

No. 3 of Twelve Italian Fantasias, Concertante, for the Flute and Piano Forte, composed by Raphael Dressler. Cocks and Co.

THIS third Number is arranged upon the admired airs, 'Buona Notte,' and Mozart's 'La mia Dorabella,' from his 'Così fan tutte,' and is equal in attractions to the former numbers of this pleasing work, (noticed in 'The Athenæum,' Nos. 69 and 83.) It is dedicated to Edmund Chambers, Esq., and published by Dressler, as his op. 74.

No. 2 of National Melodies, with Variations, for the Harp, composed by N. B. Challoner. Mayhew and Co.

THE Tyrolese air, 'Der Schweizerbue,' or 'The Swiss Boy,' with neat, familiar, and appropriate variations, expressly arranged for the harp, and written in the proper time, 4-8. After four pleasing and not difficult variations, an episode in the Sav-dominant of the key, leads ingeniously into one of

the most admired Swiss melodies, performing by Madame Stockhausen, and known as 'The Swiss Drover Boy of Appenzell;' this is followed by a short Waltz Scherzo Allegretto, as a finale; and the whole adaptation must be exceedingly desirable to a performer upon the harp of but moderate practice and acquirements, although it is by no means a puerile or trifling production.

The two favourite Barcarolles, and the Tarentula, from the admired Opera, 'Masaniello, ou La Muette de Portici,' arranged for the Piano Forte, with an Accompaniment (ad lib.) for the Flute, composed by D. F. E. Auber. Paine and Hopkins.

THIS appears to be an extract from some French edition, and is by no means so good an arrangement as we have before met with: at the same time, perhaps, there is no other publication in which is presented the three favourite dance tunes exclusively.

SOCIETY FOR SUPERSEDING THE NECESSITY OF CLIMBING BOYS FOR SWEEPING CHIMNEYS.

To effect the entire abolition of the cruel custom, of employing climbing-boys in chimney-sweeping, nothing more, we are persuaded, is required than to create a public conviction of the existence of some practicable and efficacious plan by which the necessity for having recourse to it may be avoided. It is with sincere satisfaction, therefore, that we read the last Report (the fourteenth) of the Society which has been formed with the view of superseding the use of climbing boys, and that we observe the progress lately made towards the attainment of the object of this excellent association. By the Report alluded to, we find that such an improvement has been effected in the machine for sweeping chimneys, invented under the auspices of the Society, that there are now very few cases in which it will not operate with complete success. The instrument so improved, has been submitted to the Surveyor of the Board of Works, and on the strength of a favourable written Report on it from him, a document, which is included in the appendix to the Report published by the Society, and through the influence of Mr. Secretary Peel, it has been adopted in the public offices, and by order of the Lord Chamberlain, in the royal palaces. The Annual Report of the Society contains, moreover, numerous testimonies to the effectual operation of the machine from various parts of the kingdom. It now seems to rest with the public, therefore, to complete the good work which has been so charitably and judiciously commenced. All that is required for this purpose is, that individual householders should insist on the use of the machine in the cleansing of their own chimneys, whatever objections servants or master-sweeps may raise against it. The latter are generally hostile to the improvement, because the employment of the machine demands a little more personal trouble, or a trifling additional expenditure on their parts; the management of it requires either the attendance of the master himself, or at least, of older and stronger boys than those who now generally perform the office; hence the charge of wages falls somewhat heavier. The present prices, however, are a fair remuneration for the labour of cleansing chimneys by machinery; and for the purpose of ensuring to individuals the opportunity of enforcing attention to their benevolent wishes in this respect, and of providing a remedy for cases in which masters are refractory, persons, provided by the Society with the necessary machines, are established in two distinct quarters of the town.* They cleanse chimneys by mechanical means only at the prices usually charged in the trade, and with superior cleanliness and effect.

The Society, however, while they appeal to the humanity of the public, urging them to concur in

* These establishments are at 13, Newton Street, High Holborn, Mr. Robert Day, and 2, Moor Lane, Fete Street, Cripplegate, Mr. Joseph Glass, the inventor of the machine.

putting an end to a practise so barbarous, do not propose to depend entirely on the effect of voluntary co-operation. 'Impressed,' they say, 'with the full conviction that, owing to the poverty, ignorance, indolence, and hardened habits, of most of the master chimney-sweepers, the indifference of many householders, and the prejudices of servants, the evil will never be wholly remedied, but by the aid of parliament, they have prepared a bill for the better regulation of chimney-sweepers, and their apprentices, the principal provisions of which are to prohibit climbing for the purpose of extinguishing fires in chimneys by any person under 21 years of age, after twelve months from the passing of the act; and to fix the lowest age at which it shall be lawful to bind a child apprentice to a chimney-sweep at fourteen years. The bill will be submitted to Parliament next session: the application was intended to have been made during that which has just closed, but was postponed in consequence of the devotion of so much of the time of the two Houses to the Catholic question. A revision of the Building Act, with the introduction of clauses providing for the future construction of flues in such a manner as to admit of their being readily swept by machinery, is also in contemplation.

The most cordial wishes for success, of every heart alive to the especial claims for protection of orphanage, infancy, and helplessness, not dead in short to the commonest feelings of humanity, must attend the labours of this truly Christian society.

ELEMENTARY EDUCATION IN FRANCE.

THE system of elementary education was not introduced into France until after the general peace, when a few friends to the country, aware of the advantages to be derived from its adoption, occupied themselves in endeavouring to establish it. A society for the purpose was formed, in 1815, and at the beginning met with all the encouragement from the public which could have been expected. The favour, however, in which it was held, did not proceed increasing in a degree adequate to the merit of the system; and, during the greater part of the time which has elapsed since the foundation of the institution, the support afforded it has remained stationary, or even declined, as will be perceived from the following statement recently published by order of the society, whose excellent objects, however, it is satisfactory to perceive, seem at length to be more justly appreciated, as within the last two years it has received a vast increase in its number of subscribers and funds:

Years.	Subscribers.	Subscribers lost.	Receipts.
1815 hf.-year	317	—	2,940fr.
1816	641	70	36,385 75c.
1817	686	165	—
1818	674	64	18,079 75
1819	402	309	20,800
1820	482	—	20,154 00
1821	456	50	16,572 62
1822	427	55	16,435 85
1823	406	42	27,427
1824	383	23	46,800 22
1825	423	—	—
1826	394	47	18,157 30
1827	600	—	21,036 75
1828	1408	—	43,974 70

The falling off in 1819 is attributed to causes connected with politics, and to the retirement from the administration of public affairs of General Desolles, a great promoter of the objects of the society, and who afterwards became its president. He died in the course of that year. The funds, it will be remarked, have not diminished in proportion to the defalcation of subscribers; owing to the zeal of a certain number of the members who have remained constantly faithful to the cause. In 1823, the funds of the society received an augmentation of 10,000 crowns, by the donation of a single individual. The juries at the assizes, convinced of the advantages derived to the country from the

* From the Report of the Secretary to the society

society, are in the habit of making a subscription in its aid. The Bank of France gives annually 2000fr., and the minister of the interior 1000. The year 1829 promises, with certainty, a still further and considerable increase of subscribers and funds. Twenty-eight societies, of a similar description, in different parts of France, correspond with that of Paris. Among other places, Lyons has a society established, with subscriptions to the amount of 150,000frs., to be paid within five years. This association offers to the masters desirous of establishing primary schools, to allow them the necessary funds for setting up schools for mutual instruction, on condition of their receiving five pupils gratuitously for every 100frs. advanced. This measure is represented to have been attended with beneficial consequences. At Marseilles, an old society for the promotion of Christian morality, has been converted into an education society. At Nancy, a Jewish school on the same plan is in existence, and corresponds with the society at Paris. At Rouen, the ancient school is continued, and a new one has been opened: a school for the instruction of adults has also been instituted. The three schools at Paris, under the direction, and maintained at the expense of the society, continue flourishing. That to which the appellation of Gauthier has been given after the Abbé of that name, who has so powerfully contributed to the progress of this system of education, is frequented by 237 children. Of the two schools for girls, that at the Halle aux Draps counts 410 children; that of the Clos de St. Jean de Lateran, 277. To the former of these, the name of Larocheffoucauld-Liancourt, so dear to France, is attached: to the other, that of Basset, after an estimable member of the society, lately deceased. The schools of Paris, including the three just mentioned, amount to thirty. According to the last year's statement, twenty-five of these furnished education to a total of 3,700 children. On the 1st of May, the whole number of pupils, children, and adults, in the thirty schools, was 4,177: of these, the adults amounted to 491, admitted to eight evening schools. By the exertions of the Comte de Chabrol towards the formation of new schools, or the enlargement of old ones, an increase is about to take place of 2,200 pupils. The Normal elementary school, founded by the Prefect of the Seine, is attended by 95 tutors, youths designed for master-ships, of the age of sixteen and seventeen years. An establishment, under the title *Maison Complète*, was opened in 1828, in the 12th Arrondissement, by M. Cochon. It consists of a hall for infants, and schools for boys, for girls, and for adults of the respective sexes. A Monthly Bulletin has been substituted for the *Journal d'Education*, formerly published by the society. The society expresses its acknowledgments to the British and Foreign Bible Society, for placing at its disposal, New Testaments for the purpose of being read in the schools.

VARIETIES.

MOGUL IDOL.—In the Museum of Natural History and Antiquities of Moscow, is a statue of the Mogul Idol Yamântaga, held by the Moguls of the religion of Lama or Bouddha to be the god of destruction. This image was formerly a part of the rich cabinet of antiquities presented to the University of Moscow by the late M. Demidoff. The greater part of the contents of that cabinet fell prey to the flames in 1812. The statue consists of the figure of a man with sixteen feet and thirty-four hands. It has the head of an ox, surrounded by six other heads, somewhat of human form, but differing with each other in grotesqueness of character. Above these seven heads is placed an eighth, equally monstrous, which, in its turn, is surmounted by a ninth, but this is of great beauty. All these heads are surrounded by the representations of flames, and the necks have collars composed of figures of human skulls. The statue embraces a woman, and holds in its hand the symbols of destruction and regeneration; the feet rest on similar symbols. The statue is about

five inches in height, and is of excellent workmanship. Two professors of Moscow, M. Fischer and M. Schmidt have published a work descriptive of this idol, with plates representing a front view and a profile of the figure. In this work it is maintained that Yamântaga is composed of two Sanscrit words, *yama*, (hell, gulph, abyss,) a word which also exists in the Russian language, and signifies a ditch, a hole; and *antaka* (destruction): that the Idol comes from India, and is no other than the Siva of the Indians. The religion of the Bouddhists is not considered by the authors as a schism in the worship of Brama, but on the contrary, they hold that the former was of separate and earlier origin than the latter. It is contended that modern Bouddhism differs from the ancient, which has been modified by other religions. We shall probably obtain no certain knowledge of Bouddhism until the long-expected appearance of the history promised by M. Abel Remusat.

INSECTS IN AMBER AND COPAL.—In the Transactions of the Royal Academy of Sciences of Stockholm, for 1825, is a Treatise on the Insects in Copal, with descriptions of several new genera and species found in that substance. The contents of these articles are represented as calculated to throw light on the phenomenon of the existence of insects in amber, since those which are observed in copal, are in some cases more abundant, in others, more clearly to be seen than in amber. The following conclusions are drawn from the observations on the two substances. In copal, insects of all kinds are to be found: the butterfly is most rare, wood insects are the most abundant: a striking analogy exists between the insects found in copal and amber; in both, several genera and species, not otherwise known, are observable; from them both important conclusions may be drawn as to the geography of insects: kinds, for instance, which have hitherto been considered European exclusively, are found beyond the borders of our quarter of the Globe: in the warmer climates, not only are larger insects produced, but a greater number of smaller ones, which have been overlooked by collectors: lastly, in these substances proofs are found that the parasite insects of the Southern regions differ less from those of the same kind in the Northern countries, than the insects of these respective regions in general. The article describes four new genera of insects with their species discovered in copal, viz. *Palmon bellator clavellatus et capitellatus*; *Pronopus acanthomerus*, *Articerus armatus*, and *Chalimura longipes*, besides several new species belonging to genera already known.

LORENZO DA PONTE.—The writer of the poetry to the Don Juan and other operas of Mozart, Lorenzo da Ponte, a native of Cesena, which was also the birthplace of Pius VII., is still living at New York, where, after having experienced many and great vicissitudes of fortune, he enjoys, in his eightieth year or thereabouts, comfortable and easy circumstances. He carries on the business of a bookseller, and has lately published his memoirs, in four volumes. Among other interesting matter, it contains a curious account of Casanova.

HYDROPHOBIA FROM BATHING FEET IN COLD WATER.—Dr. Barth, a German physician, in his work lately published, entitled 'Medical Observations,' mentions the extraordinary case of a man, forty years of age, who was attacked with all the symptoms of hydrophobia, from checking the perspiration of the feet. The patient was habitually subject to this inconvenience, in an extraordinary degree; and, on one occasion, after bathing the feet in cold water, he was attacked with tetanic spasms, and contraction of the throat. An infusion of elder flowers, which he attempted to swallow, was rejected with violence: at the same time, the outside of the throat swelled excessively, and a suffocating rattling took place. This effect was renewed whenever a liquid was approached to the mouth. Mustard poultices applied to the chest and calves of the legs, an anodyne lavement, and a bath of hot water, heightened by salt and cinders, provoked a profuse general perspiration, and the patient recovered.

OXFORD PRIZES.

THE Oxford University prizes for the last year have been awarded as follows:—

Latin Essay.—'Quibus potissimum rationibus gentes a Romanis debellatae ita afficerentur ut cum victoribus in unius imperii corpus coalescerent?'—To Mr. Sewell, Fellow of Exeter.

English Essay.—'The power and stability of Federative Governments.'—To Mr. Dennison, Fellow of Oriel.

Latin Verse.—'M. T. Cicero cum familiaribus suis apud Tusculum.'—Mr. Wilmot, Scholar of Balliol.

English Verse.—'Voyages of Discovery to the Polar Regions.'—Mr. Cloughton, Scholar of Trinity.

BOOKS PUBLISHED DURING THE WEEK.

The New Forest, by the Author of 'Brambletye House,' 3 vols. post 8vo., 1l. 11s. 6d.
The Loves of the Poets, by the Authoress of 'The Diary of an Ennuyée,' 2 vols. post 8vo., with Frontispiece, 21s.
Old Court, a Novel, 3 vols. post 8vo., 1l. 11s. 6d.
Sir Philip de Gasteney, a Minor, by Sir Roger Gresley, post 8vo., 8s. 6d.
The third and concluding volume of Memoirs of Josephine, post 8vo., 10s. 6d.
Blue Stocking Hall, a Novel, 2nd edit., 3 vols. post 8vo., 27s.
Dr. Grauville's Travels to St. Petersburg, 2nd edition, improved, 2 vols. 8vo., 2l. 2s.
The German Pulpit, being a Selection of Sermons, by the Rev. R. Baker, 8vo., 10s. 6d.

AMERICAN AND ENGLISH REVIEWS AND MAGAZINES.

THE Second Volume of THE EXTRACTOR (perfect in itself) is now ready, price 2s. 6d.—This Volume contains all the Voyages, Travels, Tales, Lives, New Discoveries, and Inventions, of Interest to the general reader, that have appeared in the American and English Reviews, Magazines, and Journals, published during the last six months.

"The second volume is by no means inferior to the first."—*Sun*, July 1.

OPINIONS OF VOL. I.—"The Extractor" is an extremely entertaining miscellany. It contains a vast quantity of matter."—*Literary Gazette*.

"This work contains nearly all the subjects with which miscellaneous literature and popular science is conversant."—*Edinburgh Lit. Journal*.

"This work is a most valuable compilation."—*Oxford Lit. Gazette*.

"The editor has shown great skill and tact in the execution of his difficult task."—*Monthly Review*.

J. Ware, 150, Fleet-street; and may be had of all booksellers.

INVALUABLE DISCOVERY.

ROWLAND'S ODONTO, or PEARLY DENTRIFICE, a vegetable preparation of confirmed efficacy, for Beautifying the Teeth, and Strengthening the Gums.—Experience already characterizes Rowland's Odonto as the most infallible in felicitous result of any Dentrifice ever offered to public notice. Pleasant in application, though powerful in effect, this salubrious, assuasive, and invigorating specific, accelerates, without pain, the cutting of the teeth, and averts fatality, hitherto so prevalent at that critical period of infancy. To the adult, whose teeth are threatened with decay, and whose gums are scorbutic, Rowland's Odonto will prove a surprisingly effectual renovator, imparting soundness and brilliancy, with fair passage through life of determined duration, and entirely excluding the recurrence of toothache. To the indefatigable research of an Indian Botanist, the world is indebted for this sustainer and embellisher, in the Odonto, of 'the human face divine.' As, in fact, creating and preserving a fine set of teeth, and purifying the gums, Rowland's Odonto is generally recommended by the faculty; and by all who are desirous of excelling in personal attraction will be appreciated, on trial, as a truly invaluable acquisition.—Price 2s. 9d. per box, Duty included.—Imposture is already on the alert: the public is therefore requested to observe that the Genuine Odonto has the name and address, 'A. Rowland & Son, 20, Hatton-garden,' engraved on the Government Stamp, which is pasted on the wrapper—all other preparations styled Odonto are spurious and pernicious.

DR. LINGARD'S HISTORY OF ENGLAND, IN OCTAVO.

This day is published, the Third Edition, in 12 vols. 8vo. price 71. 4s. in boards.

A HISTORY OF ENGLAND, from the first Invasion of the Romans. By JOHN LINGARD, D.D. London: Printed for Baldwin and Cradock, Paternoster-row.

"This important and original work will be completed shortly. The 12th volume brings the History down to the Twenty-seventh Year of the Reign of Charles the Second, and another volume will conclude the work."

"The opinion of the public, touching the merits of Dr. Lingard as an historian, has been long since made up. Few men have risen to greater eminence in this elevated walk of literature, and we may say the utmost confidence affirm, that no man ever possessed, in a higher degree, many of the essential requisites of an historian. He is learned, industrious, and persevering; skilful in sifting evidence, weighing probabilities, and bringing out the prominent points of character: well acquainted with the principles of constitutional law, and the spirit of our elder as well as more recent institutions; a firm but not enthusiastic friend to liberty; sometimes strikingly original, often vigorous and powerful—always sensible and judicious in his observations: and, above all, invincibly pertinacious in exploring every source, however remote, from which any thing may be drawn calculated to throw light upon any of the LOCI OBSCURIORIS of our story."—*Caledonian Mercury*, June, 1829.

N.B. A few sets of vols. 1 to 7, in 4to. may be had, price 11. 15s. per vol. The volumes are sold separately.

A COMPLETE LAW LIBRARY.

Just published, Vol. X. in royal 8vo. price 17. 11s. 6d.

A PRACTICAL AND ELEMENTARY ABRIDGMENT of the Cases argued and determined in the Courts of King's Bench, Common Pleas, Exchequer, Appeal, and at Nisi Prius; and of the Rules of Court, from the Restoration in 1660 to Michaelmas Term, 4 Geo. IV., with Important Manuscript Cases, Alphabetically, Chronologically, and Systematically arranged and translated; with copious Notes and References to the Year Books, Analogous Adjudications, Text Writers, and Statutes, specifying what Decisions have been affirmed, recognized, qualified, or overruled; comprising, under the several titles, a Practical Treatise on the different Branches of the Common Law.

By CHARLES PETERSDORFF, Esq.

Of the Inner Temple.

"This publication contains, in addition to the Authentic Law Reports, the whole of the Practical and Useful Information to be found in the Year Books, Viner's Abridgment, Comyn's Digest, Bacon's Abridgment, Cruise's Digest, and in the Equity, Admiralty, and Ecclesiastical Reports, and all the Authentic Elementary Treatises, arranged under such divisions as will conduce to the most prompt and ready reference, and under such titles as will most probably occur to the mind of the experienced or of the uninitiated member of the profession. Anxious attention has been devoted to introduce practical Information on all subjects connected with the Law and Transfer of Real and Personal Property, Criminal Jurisprudence, and Sessions Law. Although the Cases are abridged only to Michaelmas Term, 1823, yet the Notes bring the Decisions and Statutes down to the day of publication."

Vols. I. to X. comprise above two-thirds of the entire work, and a volume is published every four months.

N.B. It can scarcely be necessary to point out to the Profession, that every article is entire; and that therefore, those persons who may defer taking the work till its completion, will lose the immediate advantage which would be derived from consulting the volumes as they appear, for the subjects which they respectively embrace.

London: Printed for Baldwin and Cradock, Paternoster-row.

TERRO-METALLIC TEETH.

DR. A. JONES, Surgeon-Dentist to his Royal Highness the Duke of Orleans, 43, New Bond Street, begs to acquaint the Nobility and Gentry, that, from many years' intense application, he has invented and brought to perfection, a New System of Fixing TERRO-METALLIC, NATURAL, and ARTIFICIAL TEETH, from one to a complete Set, which are so accurately fitted as not to be distinguished from the original, and answer all the purposes of mastication, articulation, &c.—Mr. A. J. continues stopping decayed teeth with his unrivalled Anodyne Cement, which in one minute allays the most excruciating pain; and by this means carious teeth are wholly preserved and rendered useful, even if broken close to the gums. This being a metallic composition, it becomes hard as enamel in a few minutes, will not decompose with the heat of the stomach, and resists the effects of acids, atmospheric air, &c.—Cleaning, and every operation incidental to Dental Surgery.—At home from ten till five.

COLOSSEUM, REGENT'S PARK.—The Proprietors of this magnificent EXHIBITION, invite the attention of the Public to the

NEW ARRANGEMENT OF ADMISSION.

To view the stupendous Panorama of London, from the principal Galleries,—the original Ball removed from St. Paul's Cathedral,—the Prospect from the summit of the Building,—and the Saloon for the reception of Works of Art

To view the Panoramas only

To view the Conservatories, Fountain, and Swiss Cottage

Children, half-price.—Open from 10 till 8.

SCULPTURE.

TAM O'SHANTER and SOUTER* JOHNNY.—These Statues, illustrative of Scottish Character, Costume, and the Poetry of Burns—Scotland's immortal Bard—executed by the self-taught Artist, Mr. THOM, are now exhibiting at 28, Old Bond-street. Since their arrival in Town, (23d April,) they have been visited by upwards of 30,000 persons, all of whom have expressed their admiration of them as works of art.—Admission, 1s.; Books with Observations, 6d.

* Cobler.

EXHIBITION OF DRAWINGS, by J. M. W. TURNER, Esq., R.A., consisting of VIEWS in ENGLAND and WALES, executed for a Work now in course of Publication, at the Large Gallery, Egyptian Hall, Piccadilly.

Admittance, by Tickets only, which may be obtained (gratis) of the publisher, Mr. Jennings, 2, Poultry, and 325, Oxford-street. Open from Ten till Six.

Subscriber's names received at the Gallery.

IMPROVED TERRO-METALLIC TEETH.

MR. HOWARD, 52, Fleet-street, (removed from 33,) having brought to perfection an important improvement in TERRO-METALLIC TEETH, respectfully solicits the attention of the Nobility and Gentry to his new method, which he is confident will be found on investigation to be far superior in natural appearance and durability to any ever before produced in England. They perfectly restore the articulation and mastication, and are not to be distinguished in any respect from the original teeth. 52, Fleet-street. At home from 10 till 4.

This day is published, Part I, price 3s., of

A NEW and COMPLETE HISTORY OF the COUNTIES OF SURREY and SUSSEX, forming the ancient Saxon Kingdom of South Seax, from the earliest period of authentic record to the present time; including Notices of every Object of Topographical, Antiquarian, or Commercial Interest; from actual survey, by THOMAS ALLEN, author of the History of the Palace and Parish of Lambeth, the Histories of the City of London, County of York, &c. Illustrated by upwards of One Hundred Views, from Drawings by Nathaniel Whittock, engraved on steel by H. Rolls, W. J. Cooke, Rogers, Shury, Lambert, Winkles, &c.

This Work will be printed in octavo, on paper of the best quality, and will be completed in about Twenty Parts, price 3s. each. Each Part will contain Six Views and Seventy-two pages of Letter-press.

A Royal Edition, on fine thick paper, with Proof Impressions of the Plates, on India paper, will also be published, price 6s. each Part.

London: Isaac Taylor Hinson, 4, Warwick Square; Holdsworth and Ball, 18, St. Paul's Church Yard; and sold by all Booksellers in Surrey and Sussex, and the adjacent counties.

Now publishing, No. V., price 1s., of

THE DRAMATIC MAGAZINE; embellished with finely-engraved Portraits of Mr. Mathews and Miss Foote, as Jonathan Oldskirt and Fanny, in "Who Wants a Guinea?" Contents: "Theatrical Journal," "Petition of C. Bucks, Esq., Author of 'The Italiane,'" with "Remarks"—Tragedy, Comedy, and the other departments of the Drama, considered.—List of all the New Pieces brought out during the past season at the Patent Theatres, with Remarks.—Letter from a Distressed Cheesemonger.—Reviews, Miscellanies, and Anecdotes.—Advice to Players, by Dr. Swift the younger.—Provincial Intelligence.

Published by Whitaker and Co., Ave Maria-lane; and at the Artists' Depository, 87, Charlotte-street, Rathbone-place.

A few Numbers may be had with coloured Plates, price 1s. 3d.

London: Printed and Published every Wednesday Morning, by F. C. WESTLEY, 155, Strand, opposite Newcastle-street.

LITERARY CHRONICLE.

No. 90.

LONDON, WEDNESDAY, JULY 15, 1829.

Price 8d.

DEVEREUX.

Devereux: a Tale. By the Author of Pelham.
3 vols. 8vo. Colburn, London, 1829.

THE writer of this book has gained a very considerable reputation among different classes of people. Many fine ladies think him a great philosopher; and he has been praised in our hearing by a party of Cambridge Fellows for his knowledge of fashionable society. And this we take to be the secret of that success which has induced some great authorities to call the author of 'Pelham' one of the first writers of the day. A class of persons, who think his works meritorious for some quality which they do not themselves understand (and therefore admire), happen to hear that he is admired by other classes of people for other accomplishments, and he thus obtains a sort of universal celebrity.

The chief characteristic of 'Pelham' was very properly stated by the author to be unbounded impudence; and the whole book is an admirable illustration of this quality in the hero. By this he is enabled fearlessly to claim praise for success in different pursuits in which no man ever was successful. He is at once a metaphysician and a fop; and must, of course, be in one or other of his characters a mere quack. It is not hard to decide in which of them he is an utter pretender. He describes his affected refinements with the greatest delight, and in extreme minuteness. He dwells on dress, cookery, and flirtation, with all the earnestness of a man who wishes to have it believed that he devotes his life to these things. We have been told, by persons who have undoubted taste and knowledge in such matters, that Pelham is really very ignorant of them. But this does not affect our assertion, that it is in them he wishes to excel. Archdeacon Travis was a bad Greek scholar, his trade not the less was critical theology. It is in a very different way that Pelham is ignorant of philosophy. He obviously thinks of it only as a means of display. The coxcomb character follows him even into the library and the groves of Academe; and he deals out his emphatic ignorance, and false and full-blown common-places with the very air of vulgar 'dandyism' and conceited audacity which distinguished him as a man of the world and a *soi-disant* fine gentleman. He tells us indeed himself that he put away his puppyisms as he increased in years and sense. But the rake in 'Valerius Maximus,' who threw off his crown of flowers, and became a philosopher, did not afterwards carry himself with the same vain-glorious and effeminate bearing which had marked him as a reveller.

When this work appeared and was thus spoken of, it was very easy to answer that the author was not exhibiting himself, but a creation of his brain. We need not inquire whether the book bore out this assertion, for the writer has since supplied us with other means of judging him. In the 'Disowned' the prominent personages are described as very different from that egregious pretender, Pelham. But we are sorry to know that the same character of ignorant dogmatism and school-boy conceit displays itself in every page; and the character of Mordaunt is merely an attempt to force on the acceptance of the world, in black velvet and gold lettering, that 'Westminster Review,' which, in its plain drab cover, had disgusted the instincts of mankind.

Last comes 'Devereux,' heralded and hailed as the master-piece of modern literature. We will tell our reader the story of the book. It is the supposed

auto-biography of a certain Count Devereux, who is stated to have bequeathed the MS. to future generations, (like Lord Bacon bequeathing his eternal legacy,) on condition that it should not be opened for a century. Count Devereux is grandson of Sir Arthur Devereux, a country gentleman of immense fortune, who leaves two sons. The elder, after spending some time about the court of Charles II., returns to his estates in the country. The younger enters the French service, becomes a distinguished soldier, and when he dies is a marshal of France, and father of three sons. These (with their mother) seek the protection of their childless uncle, and Sir William receives them into his house. Count Devereux, the auto-biographer, is the eldest of the three. He is noted even in boyhood for sarcastic wit, and (of course in a book by the author of 'Pelham') for extreme idleness combined with the most extraordinary talents and powers of application. His second brother, Gerald, is a clever and handsome lad; and the third, Aubrey, a gentle and delicate boy. The three go to the same school, and hate each other not only heartily but with the utmost malignity. A Jesuit, Montreuil, the father confessor of the family, and cut out by the long-established pattern of a Jesuit, attempts to gain all the influence he can over the young count, who, at the age of fifteen or sixteen, and knowing nothing whatever of the world, is a perfect match for the accomplished schemer. When the boys leave school, Morton (the count) falls in love with the daughter of a poor Spanish refugee (Isora); but, though she confesses that she loves him, she refuses to give him her hand, and he discovers that a person, whom he believes to be his brother Gerald, is his rival; the father and daughter disappear, and Morton goes to London, in company with a woman of fashion, a Lady Hasselton, whose gallant he becomes. In London, he of course makes himself an extravagant fine gentleman and coxcomb; he then discovers the retreat of Isora, the Spanish lady, and on her father's death secretly marries her. Sir William Devereux dies; and when the will is opened, Morton, the eldest brother and the favourite of the old knight, is only to receive £20,000, while the estates are bequeathed to Gerald. He returns to London, and a packet is given him, which he is assured will prove the will to be a forgery; but he is desired not to open it for a week; and, in the interval, two men break into his room, seize the papers, and murder Isora, while she interposes to save him from their blows.

In the mean time he has become a friend of Lord Bolingbroke's, and on that minister's disgrace and flight he accompanies him to France. Here he sees Louis Quatorze, and becomes a friend of the Regent, Orleans; he quarrels with Dubois, and, being sent out of France, takes service with the Czar Peter. At his death, Count Devereux, now a rich and celebrated man, quits Russia, and goes to Italy to study the question of the Immortality of the Soul. He satisfies his mind on the subject, but unhappily does not think fit to furnish us with any of the arguments which set him at rest. Having achieved this, he falls in with a hermit, in whom he discovers his brother Aubrey. The death of this youth had been announced several years before. But Count Devereux now learns, from a written confession, that this had been part of a plan of the Jesuit Montreuil. Aubrey had, it seems, with the sweetest and most seraphic expression, (which had deceived every one into believing him a saintly personage,) the blackest possible heart. It was he who had made love to

Isora, and been rejected by her; and he had been accessory to Montreuil's plan of forging a will which should transfer the estate from Morton to Gerald. It was he who had murdered Isora, and he had afterwards gone mad, and become a black penitent. He dies; and Morton returns to England, and kills the Jesuit. Gerald is dispatched in a fray; and the count rebuilds the old mansion-house, which had been burnt down, and writes his memoirs.

This story, probably, does not fill one-half of the three volumes; but, in the course of the count's wanderings, he happens to fall in with nearly all the remarkable men of that period, and more especially becomes intimate with Lord Bolingbroke, who is described at length; only the count does not seem to have known that he held any remarkable opinions. It is curious, that the descriptions of Devereux's eminent contemporaries are by far the cleverest things in the book, and yet have not the slightest business to appear in it; for a novel told in the first person should undoubtedly contain nothing which does not bear in some way on the character and fortunes of the hero: and that character and those fortunes would be altogether as intelligible and interesting as they now are, if Lord Bolingbroke, and all the wits of the time, were swept from the volumes. Devereux himself constantly tells us, that he was a man of peculiarly deep and earnest character; but the whole style of his memoirs is like that of 'Pelham,' and 'The Disowned,' one of indescribable impertinence and frivolity, full of agonies, ecstasies, and conceits; far-fetched poverty of expression, and ostentatious theories, which, while they are intended to be paradoxes, have truisms for their premises, and for their conclusions blunders. There are about five hundred phrases or sentences in the work which this proud, severe soldier, so remarkable for his afflicted and solitary spirit, points out to the wonder of the circulating libraries as either peculiarly witty or sublime, by having them printed in Italics; nor would we insinuate that he was wrong in so doing, for it saves a reader a great deal of trouble to be told, on the best authority, where there is a fine thing, and what he is expected to admire.

The portrait of Lord Bolingbroke, about which there is much cackling in the notes to this work, and in some periodical publications, is evidently very satisfactory to the writer. And we should, indeed, have expected that such a man as St. John, of all eminent Englishmen the least English, and more a pretender to talents and accomplishments which he had not, than ever was any one who really had so much to be proud of,—we should have expected that he would be the ideal and model for such a mind as that which produced 'Pelham' and 'Devereux.' But we are also persuaded, that what this author admires in Bolingbroke is not his real merit, but the false glare of his trickeries and assumptions. It is certainly a fine thing and a great triumph for any man's vanity to be allowed to treat the opinions of the world, and the monuments of history, and truth itself with an aristocratic and insolent superiority. This, by the aid of rank and talent, Bolingbroke did, and was admired, and is now (thank Heaven!) nearly forgotten. But it will not do for a mere literary handicraftsman to clothe himself in the tattered and moth-eaten ermine of the peer, and mimic his lordly bearing.

For our parts, we profess to be but little skilled in nice matters of criticism. We own that, but for the statement of the editor, we should have supposed the work before us to be the composition, not of Count Devereux writing a century ago, but of some book-

compounder of our own day. Its folly and conceit might have belonged, indeed, to any century since the flood; but its mock passion and 'intense' exaggeration could scarcely have been displayed by an Englishman in any age before our own. It could never be necessary in any time before our own to point out that a dwarf in convulsions is not a giant.

We must add, that there is a good deal of smart talent in some of the scenes of society described in these pages; and probably we may give in our next number a clever conversation at a supper of the French wits.

THE LIFE OF LOCKE.

The Life of John Locke, with Extracts from his Correspondence, Journals, and Common-Place Books. By Lord King. 1 vol. 4to. pp. 404. Colburn. London, 1829.

(Second Notice; see p. 420.)

IN our previous notice of this work, we made a few general remarks on the character of Locke's mind and the value of his writings, and subjoined one of his letters, which appeared to us remarkable for spirit and cultivated talent. We now proceed to give an account of the contents of Lord King's volume. The first division of it contains little except a few letters of Locke, one of which we have extracted, and there are two others, written about the same time and from the same place, and no less remarkable for lively ability. A short one to his father is chiefly noticeable as being even more than ordinarily affectionate. Then follow large extracts from Locke's journals, beginning in the year 1675 (he was born in 1632.) They are a curious medley of notices recorded during his journeys and residence in France, and relating to almost every conceivable subject: books, works of art, dress, machinery, eating, religion, the pretty face of a damsel at an inn, parasols, tapestry, mathematics, soldiers, markets, monks, and natural philosophy. Mingled with these are long trains of speculations; and the whole presents an admirable picture of a quiet, observant, acute, and instructed mind. We will extract a passage, all the spirit of which is curiously inconsistent with doctrines deduced from his great work by later reasoners:

'JUNE 24th.—There are two sorts of knowledge in the world, general and particular, founded upon two different principles; *i. e.* true ideas, and matter of fact, or history. All general knowledge is founded only upon true ideas; and so far as we have these, we are capable of demonstration or certain knowledge: for he that has the true idea of a triangle or circle, is capable of knowing any demonstration concerning these figures; but if he have not the true idea of a scalenon, he cannot know any thing concerning a scalenon, though he may have some confused or imperfect opinion concerning a scalenon, upon a confused or imperfect idea of it; or when he believes what others say concerning a scalenon, he may have some uncertain opinion concerning its properties; but this is a belief, and not knowledge. Upon the same reason, he that has a true idea of God, of himself, as his creature, or the relation he stands in to God and his fellow-creatures, and of justice, goodness, law, happiness, &c. &c., is capable of knowing moral things, or have a demonstrative certainty in them. But though, I say, a man that hath such ideas, is capable of certain knowledge in them, yet I do not say that presently he hath thereby that certain knowledge, no more than that he hath a true idea of a triangle and a right angle, doth presently thereby know that three angles of a triangle are equal to two right ones. He may believe others that tell him so, but know it not till he himself hath employed his thoughts on and seen the connection and agreement of their ideas, and so made to himself the demonstration; *i. e.* upon examination seen it to be so. The first great step, therefore, to knowledge, is to get the mind furnished with true ideas, which the mind being capable of knowing of moral things as well as figures, I cannot but think morality, as well as mathematics, capable of demonstration, if men would employ their understandings to think more about it, and not give themselves up to the lazy, traditional way of talking one after another. By the knowledge of natural

bodies, and their operation reaching little farther than bare matter of fact, without having perfect ideas of the ways and manners they are produced, nor the concurrent causes they depend on; and also the well management of public or private affairs depending upon the various and unknown humours, interests, and capacity of men we have to do with in the world, and not upon any settled ideas of things. Physique, polity, and prudence, are not capable of demonstration, but a man is principally helped in them by the history of matter-of-fact, and a sagacity of enquiring into probable causes, and finding out an analogy in their operations and effects. Knowledge then depends upon right and true ideas; opinion upon history and matter-of-fact; and hence it comes to pass, that our knowledge of general things are *eternæ veritates*, and depend not upon the existence or accidents of things, for the truths of mathematics and morality are certain, whether men make true mathematical figures, or suit their actions to the rules of morality or no. For that the three angles of a triangle are equal to two right ones, is infallibly true, whether there be any such figure as a triangle existing in the world or no. And it is true, that it is every man's duty to be just, whether there be any such thing as a just man in the world or no. But whether this course in public or private affairs will succeed well,—whether rhubarb will purge, or quinquina cure an ague, is only known by experience; and there is but probability grounded upon experience or analogical reasoning, but no certain knowledge or demonstration.

'By having true and perfect ideas, we come to be in a capacity of having perfect knowledge, which consists in two parts: 1st. The knowing the properties of the thing itself; thus he that hath the true idea of a triangle, may know, if he will examine and follow the conduct of his reason, that its three angles are equal to two right ones, and the like. 2nd. The knowing how it stands related to any other figure, of which he has a perfect idea; viz. that of a triangle. But without the having these ideas true and perfect, he is not capable of knowing any of these properties in the thing itself, or relative to any other, though he may be able to say, after others when he has affirmed it, that the three angles of a triangle are equal to two right ones, and believe them to signify truth; though he himself knows not what these words signify, if he have no true ideas of a triangle or right angles, or knows them not to be true, if he have not made out to himself that demonstration which is by comparing the ideas and their parts together.

'The best Algebra yet extant is Outred's, though to all Algebra there needs but two theorems of Euclid, and five rules of Descartes, but those who are not masters of it make use of more.

'"*Les esprits populaires s'offence de tout ce qui repugne à leurs préjugés*;" one ought to take care, therefore, in all discourses, whether narrative or matter-of-fact, instructive to teach any doctrine, or persuasive, to take care of shocking the received opinion of those one has to deal with, whether true or false.'—Pp. 120—122.

Between his French diary and the documents relating to his loss of the studentship, the noble editor inserts a very curious paper, containing Locke's directions to a foreigner for seeing the wonders of England. We confess they strike us as scarcely worthy of the eminent person from whom they proceeded; and it would be wiser to imitate his own practice in travelling on the Continent than to follow his precepts. The document, however, is so singular for the light it throws on many petty details of that period, and is so well adapted to interest our readers, that we give it as we find it in the book:

'ENGLAND.—1679.

'The sports of England, which, perhaps, a curious stranger would be glad to see, are horse-racing, hawking, and hunting. Bowling.—At Marebone and Putney he may see several persons of quality bowling two or three times a week all the summer; wrestling, in Lincoln's Inne Field every evening all the summer; bear and bull-baiting, and sometime prizes, at the Bear-Garden; shooting in the long-bow and stob-ball, in Tothill Fields; cudgel-playing, in several places in the country; and hurling, in Cornwall.

'LONDON:—See the East India House, and their magazines; the Custom-House; the Thames, by water, from

London Bridge to Deptford; and the King's Yard at Deptford; the sawing windmill; Tradescant's garden and closet; Sir James Morland's closet and water-works; the iron mills at Wandsworth, four miles above London, upon the Thames; or rather those in Sussex; Paradise by Hatton Garden; the glass-house at the Savoy, and at Vauxhall. Eat fish in Fish-street, especially lobsters, Colchester oysters, and a fresh cod's-head. The veal and beef are excellent good in London; the mutton better in several counties in England. A venison pasty and a chine of beef are good every where; and so are crammed capons and fat chickens. Railles and heath-polts, ruffs, and reeves, are excellent meat wherever they can be met with. Puddings of several sorts, and creams of several fashions, both excellent, but they are seldom to be found, at least in their perfection, at common eating-houses. Mango and saio are two sorts of sauces brought from the East Indies. Bermuda oranges and potatoes, both exceeding good in their kind. Cheddar and Cheshire cheese.

'Men excellent in their Arts.

'Mr. Cox, in Long Acre, for all sorts of dioptical glasses.

'Mr. Opheel, near the Savoy, for all sorts of machines.

'Mr. —, for a new invention he has, and teaches to copy all sorts of pictures, plans, or to take prospects of places.

'The King's gunsmith, at the Yard by Whitehall.

'Mr. Not, in the Pall-Mall, for binding of books.

'The Fire-eater.

'At an ironmonger's near the May-pole, in the Strand, is to be found a great variety of iron instruments, and utensils of all kinds.

'At Bristol see the Hot-well; St. George's Cave, where the Bristol diamonds are found; Ratcliffe Church; and at Kingwood the coal-pits. Taste there Milford oysters, marrow-puddings, cock-ale, metheglin, white and red muggets, elvers, sherry, sack, (which, with sugar, is called Bristol milk;) and some other wines, which, perhaps, you will not drink so good at London.

'At Gloucester observe the whispering place in the cathedral.

'At Oxford see all the colleges, and their libraries; the schools, and public library; and the physic-garden. Buy there knives and gloves, especially white kid-skin; and the cuts of all the colleges graved by Loggins.

'If you go into the north, see the Peak in Derbyshire, described by Hobbs, in a Latin poem, called "*Mirabilia Pecci*."

'Home-made drinks of England are beer and ale, strong and small; those of most note, that are to be sold, are Lambeth ale, Margaret ale, and Derby ale; Herefordshire cider, perry, meade. There are also several sorts of compounded ales, as cock-ale, wormwood-ale, lemon-ale, scurvygrass-ale, college-ale, &c. These are to be had at Hercules Pillars, near the Temple; at the Trumpet, and other houses in Sheer Lane, Bell Alley; and, as I remember, at the English Tavern, near Charing Cross.

'Foreign drinks to be found in England are all sorts of Spanish, Greek, Italian, Rhenish, and other wines, which are to be got up and down at several taverns. Coffé, thé, and chocolate, at coffee-houses. Mum at the mum houses, and other places; and Molly, a drink of Barbadoes, by chance at some Barbadoes merchants. Punch, a compounded drink, on board some West India ships; and Turkish sherbet amongst the merchants.

'Manufactures of cloth, that will keep out rain; flanel, knives, locks, and keys; scabbards for swords; several things wrought in steel, as little boxes, heads for canes, boots, riding-whips, Rippon spurs, saddles, &c.

'At Nottingham dwells a man who makes fans, hand-bands, necklaces, and other things of glass, drawn out into very small threads.'—Pp. 123—126.

After the narrative of Locke's deprivation, we find some extracts from the journal kept by him in Holland. To these succeed a few letters, and then an account of some of his works, chiefly extracted from Dugald Stewart. We next find two long letters from Lord Ashley, afterwards the excellent and philosophic Shaftesbury; and these we are inclined to hold as among the most valuable in the book; but, unhappily, it would be almost useless to submit them to the general reader without a more extended commentary than we have space to give. The statement

made by Lord King as to the controversy between Locke and Stillingfleet, is quite inadequate, both as to extent and comprehensiveness: a just account of the grounds assumed by the two antagonists, and the deduction of the controversy to our own day, (for so long has it been maintained by successive opponents,) would be one of the most valuable books that could be written. After some miscellaneous matter, several letters of Newton are published; they chiefly relate to his theological views; but from one of them it appears that Locke believed in the possibility of multiplying metals, which Newton, as might be expected, discredits, though by no means so decidedly as any educated person would at present. The letters from Lord Somers are not very remarkable; but several from Lord Peterborough are full of talent, and we should like, if we had sufficient room, to amuse our readers by one or two of them. There is a good prospect, however, that the whole life and character of this extraordinary man will soon be given to the world by the fittest of all living biographers. A letter from Locke himself to a Mr. Cudworth is curious, as it contains many inquiries as to the state of India, and shows that amid declining years and broken health he was eager as ever for knowledge, even on subjects apparently the most remote. A considerable number of letters to his relative, Mr. King, (afterwards Lord Chancellor,) are published in the volume, and are admirable for the good sense, knowledge of the world, and kindness, which display themselves in every line.

Of the extracts from his common-place book and miscellaneous papers, we shall say nothing but that they perfectly sustain his character for acute and honest speculation, though they add but little to our knowledge of the man, or of his opinions. No advantageous examination of them could be made without a wide and difficult comparison of all his published writings, such as would be totally unfit for the extent and nature of this journal. We will conclude with the quotation of one of his letters, which gives us his judgment as to the only one of his English contemporaries, (make what abatement from his fame you will,) who was of larger and more vigorous mind than himself:

'DEAR COUSIN,

Oates, April 30, 1703.

'I am puzzled in a little affair, and must beg your assistance for the clearing of it. Mr. Newton, in Autumn last, made me a visit here; I showed him my Essay upon the Corinthians, with which he seemed very well pleased, but had not time to look it all over, but promised me if I would send it him, he would carefully peruse it, and send me his observations and opinion. I sent it him before Christmas, but hearing nothing from him, I, about a month or six weeks since, writ to him, as the enclosed tells you, with the remaining part of the story. When you have read it, and sealed it, I desire you to deliver it at your convenience. He lives in German St.: you must not go on a Wednesday, for that is his day for being at the Tower. The reason why I desire you to deliver it to him yourself is, that I would fain discover the reason of his so long silence. I have several reasons to think him truly my friend, but he is a nice man to deal with, and a little too apt to raise in himself suspicions where there is no ground; therefore, when you talk to him of my papers, and of his opinion of them, pray do it with all the tenderness in the world, and discover, if you can, why he kept them so long, and was so silent. But this you must do without asking why he did so, or discovering in the least that you are desirous to know. You will do well to acquaint him, that you intend to see me at Whitsuntide, and shall be glad to bring a letter to me from him, or any thing else he will please to send; this perhaps may quicken him, and make him despatch these papers if he has not done it already. It may a little let you into the freer discourse with him, if you let him know that when you have been here with me, you have seen me busy on them (and the Romans too, if he mentions them, for I told him I was upon them when he was here) and have had a sight of some part of what I was doing.

'Mr. Newton is really a very valuable man, not only for his wonderful skill in mathematics, but in divinity too, and his great knowledge in the Scriptures, wherein I know few his equals. And therefore pray manage the

whole matter so as not only to preserve me in his good opinion, but to increase me in it, and be sure to press him to nothing, but what he is forward in himself to do. In your last, you seemed desirous of my coming to town; I have many reasons to desire to be there, but I doubt whether ever I shall see it again. Take not this for a splenetic thought: I thank God I have no melancholy on that account, but I cannot but feel what I feel; my shortness of breath is so far from being relieved by the renewing season of the year as it used to be, that it sensibly increases upon me. 'Twas not therefore in a fit of despondency, or to prevail with you to let me see you, that in my former I mentioned the shortness of the time I thought I had in this world. I spoke it then, and repeat it now upon sober and sedate consideration. I have several things to talk to you of, and some of present concernment to yourself, and I know not whether this may not be my last time of seeing you. I shall not die the sooner for having cast up reckoning, and judging as impartially of my state as I can. I hope I shall not live one jot the less cheerfully the time that I am here, nor neglect any of the offices of life whilst I have it; for whether it be a month, or a year, or seven years longer, the longest any one out of kindness or compliment can propose to me, is so near nothing when considered, and in respect of eternity, that if the sight of death can put an end to the comforts of life, it is always near enough, especially to one of my age, to have no satisfaction in living.

'I am your affectionate cousin,

'And humble servant, J. L.'

TRAVELS TO CONSTANTINOPLE.

Travels to and from Constantinople in the years 1827 and 1828, or Personal Narrative of a Journey from Vienna through Hungary, &c. to Constantinople, and from that City to the Capital of Austria, by the Dardanelles, &c. by Captain Charles Colville Frankland, R. N. 2 vols. 8vo. Colburn, London.

SOME half-dozen years since, we had the honour of being succeeded as inmates of a miserable hovel, graced with the pompous name of 'Lazzeretto of Syracuse,' by a frank and hearty Englishman, of whom we subsequently heard the following anecdote. About six years (more or less) previous to the period of which we were speaking, Mr. M—— felt a strong desire to become a settled man, and having wherewithal to make a life in town comfortable, he engaged a proper dwelling in a suitable quarter of the capital, and furnished it in a style of splendour becoming his affluence. The upholsterers out, friends were let in, and a merry house-warming took place. Among the guests was a gentleman who was about to depart the following evening for Paris. Mr. M——, who felt that a little change and relaxation after the worry and annoyances of repairing, painting, and furnishing, would be beneficial, volunteered to accompany his friend as far as Calais. It was but the jaunt of a few hours, and three or four days would witness his return. The silk inexpressibles and half-dozen shirts, accordingly soon found their place in the valise; and the twenty-fourth hour after the workmen had dragged their reluctant heels over the threshold of Mr. M——'s new domicile, saw the master himself on board the Calais steam-packet, at the Tower-stairs. Once on the other side of the channel, our jovial friend had too much of the social spirit to allow his companion to go alone from Calais. The new furniture would not spoil in a week, and now that foot had been set in the land of Monsieur, it would at any rate be as well to see Paris and the Palais Royal. To be brief, the Calais trip of our worthy countryman had not seen its termination when we fell in with him in the ancient Ortygia. That was in the year 1823: he was then on his return a second time from Alexandria. Six years more have now elapsed, nor have the damask chairs been yet uncovered. We have more than once had occasion to make inquiries for our friend; he was still wandering, nor had we long lost sight of him, when opening the new book of Captain Frankland, with an early copy of which we

have just been favoured in time for a notice, but not for a review, in this week's 'Athenæum,' we find him the same affable, cordial person as ever—locked in the familiar hug of a Capuchin friar, a recluse in the vicinity of Mount Lebanon, the acquaintance of a former visit to the convent of Solima;

For the sake of this fellow-traveller who had accompanied Captain Frankland thus far, we will give the latter whatever advantage may ensue from an early notice of his travels. We will deviate for once from the rule which we prescribe to ourselves, and furnish our readers with a sample of the contents of his journal before we have had the opportunity of giving the book a thorough perusal.

We alight on a somewhat diverting picture of petty vexations to which the eastern traveller is but too often subjected. Captain Frankland has spent a day at Baalbeck, and is desirous of proceeding on his journey to Damascus:

'I arose before the dawn, to urge the preparations for departure; but, to my no small astonishment, found that my muleteer had decamped, after having induced Giacomo to pay his wages up to last night. I now found the evil consequences of paying Arabs beforehand. He had however forgotten to take with him his mules and his mulet; these I therefore instantly seized upon, resolving *en dernier lieu*, to proceed on to Damascus without him. I despatched Giacomo in search of him, who returned with a message from him, saying that he had made a better bargain to go on to Zahle, a Christian town at the eastern foot of Mount Lebanon, from whence he could carry dried grapes, and figs, and corn, back to his native village, Buckfaya, and that he was afraid to go on to Damascus, dreading ill usage in that city. The fact was he wanted to force me to increase his wages, by leaving me, as he thought, destitute of the means of continuing my journey.

'I now sent for the Cogia Bashas, the only magistrates in the place, and told him how I was situated, and that by agreement made at Buckfaya, I had a right to take the mules on to Damascus, should I desire to do so; that all I required at his hands was justice, for which I hinted I was both willing and able to pay; and concluded by saying, that if he did not choose to force the muleteer to perform his contract, I should proceed on my journey without waiting for him; and in the event of my passage being opposed, that I was resolved to shoot both the mules, as the only means left in my hands of punishing the muleteer for his treachery.

'The Cogia Bashas said that I had reason on my side, and despatched some of his myrmidons to look for the delinquent, who was hidden somewhere in the town. We waited very patiently for him a long while; and as he did not make his appearance, the Cogia Bashas told me I was at liberty to depart without him, and that he would send some of his people with me to protect me, and bring the mules back from Damascus. I was upon the point of starting, when the muleteer arrived, accompanied by a great many others of his profession, Christians of Zahle, a very fierce and powerful tribe of Arabs; these men were all armed, and seemed resolved to screen the muleteer from punishment.

'The Cogia Bashas was overawed, but still said that he would do justice; and proceeded to open his court upon the flat roof of a house near which we were standing. The Metoalis grouped themselves on one side, and the Christians of Zahle on the other side of the Cogia Bashas. I sat down a little in front of them all, backed by the Greeks of the town, having Giacomo, as my dragoman, on my right hand, on his feet, and Ponto on my left.

'I now, through my interpreter, repeated all that I had before said to the Cogia Bashas, and insisted that the muleteer should be well bastinadoed for his breach of agreement, which punishment, I said, I would certainly inflict upon him with my own hands, should the Cogia Bashas suffer himself to be deterred from doing his duty, by the friends of the muleteer, who, I doubted not, were all as great rogues as himself.

'The Cogia asked the culprit what he had to say in his defence; and upon receiving no answer, gave a nod to some of his people, who moved forward to seize the muleteer. The Christians of Zahle interposed to save him, and the Metoalis retired; upon seeing this, I ran

into the centre of the group and seized him by the arm, calling upon Giacomo to assist me in dragging him away. The men of Zahle again interposed to save their fellow mule-driver, and I was compelled to relinquish my grasp.

"We all sat down again as tranquilly as if nothing had happened; and it appeared to me, that I should obtain no justice at the hands of the Cogia Basha, who was evidently afraid to execute the law. I endeavoured again to rouse his spirit, by an appeal to his avarice, and greatly vaunted to him the justice and magnanimity of the Turkish magistrates in general;—all was in vain, and I was proceeding to mount the mules, and to set off in spite of all obstacles, when a Metoali offered to supply me with horses at a cheaper rate than I was paying for the mules.

"This was too advantageous an offer to be refused, and I eagerly accepted it, as it seemed to be the only means of compromising the business with honour to myself. The mules were therefore unloaded, and the muleteer suffered to depart with a whole skin. He, however, had been heartily frightened, and perhaps abundantly punished by the anxiety he must have felt, while under the dread of the bastinado.

"All being now seemingly arranged, the crowd gathered around me, and began to examine my arms, and every article of my equipment; they were more particularly struck with my English pistols, but could not be induced to believe that they would carry far. To gratify their curiosity, I fired one at a black mark upon a wall at some distance, and was lucky enough to strike it. The pistols were rifles, of which description of arm the Turks have no notion. They seemed all very much surprised and delighted.

"One of the Greeks, a fine athletic fellow, armed up to the teeth, came forward and said, that the English were the only people in the world capable of making such weapons; and asked, when England would do something for the Greeks of Syria, as she was doing for those of the Morea.

"I was surprised at his boldness in asking such a question among so many Mussulmans, and did not at first make him any reply; but he, observing my caution, bade me not be afraid; he said that the Greek and Arab Christians in Baalbeck were more than a match for the Metoali, who were indeed themselves as anxious for a change in the order of things as the Christians. I then told him that it depended entirely upon themselves, and upon their own good and courageous conduct, when the sympathies of Englishmen should be attracted towards the cause of the suffering Christians of Syria; but that if they really desired an improvement in their political state, they should depend upon their own exertions, and their own virtues, to obtain it for them, and not upon the aid of foreign arms, which perhaps might eventually be turned against themselves.

"I now returned to my quarters at the Greek curate's, awaiting the arrival of the promised horses; but after waiting some time, and seeing nothing of them, I sent Giacomo to find out the Metoali who had engaged to furnish them immediately. After some delay the Metoali came, but said that the horses were out at grass, and could not be caught up until the morrow, unless I would raise the price which we had agreed upon. His drift was very clear, and he made quite sure of obliging me to pay nearly double the agreement, knowing that the muleteer had set off for Zahle, and that I was totally unprovided with the means of getting forward.

"I was, however, resolved not to submit to any thing like imposition, foreboding that should I once begin to show any symptoms of weakness, attempts of this sort would never end. I called the curate and several of the Greeks, to witness that I was willing to fulfil the agreement which had been made in sight of them all; but that I would not yield to such dishonest attempts upon my purse; that I would rather remain at Baalbeck until the arrival of the first caravan, than allow myself to be imposed upon. That I had frequently heard of the bad character of the inhabitants of Baalbeck, and that however unwilling I might have been to place faith in such general reports, I was now too fully convinced of their being as bad as they were represented to be, and that their conduct to an unprotected stranger was unworthy of any but a set of robbers and ruffians. I then called for

water, and washed the dust of Baalbeck off my hands and feet, in sight of the multitude, showing them the abhorrence and contempt with which I viewed their proceedings towards me.

"The curate now began to take my part, observing that I had spoken "true words," and that the Greeks felt as I did, and would see me righted. Upon this, an immense fracas between the armed ruffians took place in the court-yard; the Greeks all insisting upon my side, and the Metoali against me. Had I not known the nature of Oriental squabbles, I should have anticipated bloodshed; the flashing eyes, wagging beards, uplifted hands, and drawn handjars, all giving apparent indication of such a denouement. After a great deal of shouting, stamping, foaming, and spitting, the mob grew quieter, and all subsided into a calm; each individual sitting down upon the ground as if nothing had occurred. I was reclining meanwhile upon my carpet, watching the event, my man Giacomo looking very pale and uneasy at the storm which had so suddenly gathered around us. The Greek curate at length came to me, and informed me that the Metoali had been obliged, by the Cogia Bashi, to fulfil his agreement, and that I might expect the horses in a short time.

"At fifteen minutes past ten, the cattle came, and I own that I did feel considerable delight in getting into my saddle, and taking leave of such a set of Philistines as these said Baalbeckians, unhurt in person or purse. I made, of course, a trifling present to the curate and the Cogia Bashi, both of whom seemed delighted with my generosity; indeed, to the honour of the curate be it spoken, I had some difficulty in persuading him to accept my gift, and even at last, it was only under the pretext of his distributing it in alms to the poor of his communion, that he would receive it. I saw no more of the Emir's people, nor did I hear another syllable about the present which he usually expects."—Pp. 73 to 83.

The horses, however, were after all but a bad exchange for the mules, since they proved miserable hacks. We may leave them for the present, therefore, in the certainty of being able to overtake them when we please. We purpose in a very short time to put their metal to the proof.

MEMOIRS OF THE EMPRESS JOSEPHINE.

Memoirs of the Empress Josephine. Vol. 3. 8vo. Colburn, 1829.

THIS is the third volume of a work, of which the earlier ones appeared a few months ago. The book contains a good deal of tediousness and some folly. But mingled with this we have found some original anecdotes, and a more detailed account of an interesting and celebrated woman than ever before existed. The present volume consists almost entirely of letters, some of which are curious, but the majority insipid and worthless. We extract a letter from Josephine to Napoleon, which seems to prove that he was nearly as susceptible of jealousy as of ambition.

"Is it possible, general, that the letter I have just received comes from you? I can scarcely credit it when I compare that letter with others now before me, to which your love imparts so many charms! My eyes, indeed, would persuade me that your hand traced these lines; but my heart refuses to believe that a letter from you could ever have caused the mortal anguish I experience on perusing these expressions of your displeasure, which afflict me the more when I consider how much pain they must have cost you.

"I know not what I have done to provoke some malignant enemy to destroy my peace by disturbing your's; but certainly a powerful motive must influence some one in continually renewing calumnies against me and giving them a sufficient appearance of probability to impose on the man who has hitherto judged me worthy of his affection and confidence. These two sentiments are necessary to my happiness, and if they are to be so soon withdrawn from me, I can only regret that I was ever blest in possessing them or knowing you.

"On my first acquaintance with you, the affliction with which I was overwhelmed led me to believe that my heart must ever remain a stranger to any sentiment resembling

love. The sanguinary scenes of which I had been a witness and a victim constantly haunted my thoughts. I therefore apprehended no danger to myself from the frequent enjoyment of your society, still less did I imagine that I could for a single moment have fixed your choice.

"I, like every one else, admired your talents and acquisitions; and better than any one else, I foresaw your future glory; but still I loved you only for the services you rendered to my country. Why did you seek to convert admiration into a more tender sentiment by availing yourself of all those powers of pleasing with which you are so eminently gifted, since, so shortly after having united your destiny with mine, you regret the felicity you have conferred upon me?

"Do you think I can ever forget the love you once cherished for me? Can I ever become indifferent to the man who has blest me with the most enthusiastic and ardent passion? Can I ever efface from my memory your paternal affection for Hortense, the advice and example you have set before Eugene? If all this appears impossible, how can you for a moment suspect me of bestowing a thought on any but yourself?

"Instead of listening to traducers who, for reasons which I cannot explain, seek to disturb our happiness, why do you not silence them by enumerating the benefits you have bestowed on a woman whose heart could never be reproached with ingratitude? The knowledge of what you have done for my children would check the malignity of these calumniators, for they would then see that the strongest link of my attachment for you depends on my character as a mother. Your subsequent conduct, which has claimed the admiration of all Europe, could have no other effect than to make me adore the husband who gave me his hand when I was poor and unfortunate. Every step you take adds to the glory of the name I bear: yet this is the moment that has been selected for persuading you that I no longer love you! Surely nothing can be more wicked and absurd than the conduct of those who are about you, and are jealous of your marked superiority!

"Yes, I still love you, and no less tenderly than ever. Those who allege the contrary, know that they speak falsely. To those very persons I have frequently written to inquire about you and to recommend them to console you by their friendship, for the absence of her who is your best and truest friend.

"Yet, what has been the conduct of the men in whom you repose confidence and on whose testimony you form so unjust an opinion of me? They conceal from you every circumstance calculated to alleviate the anguish of our separation, and they seek to fill your mind with suspicion in order to drive you from a country with which they are dissatisfied. Their object is to make you unhappy. I see this plainly; though you are blind to their perfidious intentions. Being no longer their equal you have become their enemy, and every one of your victories is a fresh ground of envy and hatred.

"I know their intrigues, and I disdain to avenge myself by naming the men whom I despise, but whose valour and talents may be useful to you in the great enterprise which you have so propitiously commenced. When you return I will unmask these enemies of your glory—but no; the happiness of seeing you again will banish from my recollection the misery they are endeavouring to inflict upon me, and I shall think only of what they have done to promote the success of your projects.

"I acknowledge that I see a great deal of company; for every one is eager to compliment me on your success, and I confess I have not resolution to close my doors against those who speak of you. I also confess that a great portion of my visitors are gentlemen. Men understand your bold projects better than women, and they speak with enthusiasm of your glorious achievements, while my female friends only complain of you for having carried away their husbands, brothers, or fathers. I take no pleasure in their society if they do not praise you; yet there are some among them whose hearts and understandings claim my highest regard, because they entertain sincere friendship for you. In this number I may distinguish Mesdames d'Aiguillon, Tallien, and my aunt. They are almost constantly with me, and they can tell you, ungrateful as you are, whether I have been cognat-

thing with every body. These are your words, and they would be hateful to me were I not certain that you have disavowed them and are sorry for having written them.

"I am terrified at the numerous perils which surround you, and of the extent of which I should have had no idea, had not Eugene insisted on my writing to entreat that you will not fly in the face of danger and unnecessarily expose a life which is precious not merely to your family and friends. Remember, that on you depends the destiny of your companions in arms and of millions of soldiers who would not have fortitude to endure the hardships to which they are exposed, but for the encouragement which your presence affords them.

"Do not, I conjure you, over exert your strength. Listen not to the dictates of your own ever-active mind, but to the advice of those who love you. Berthier, Bourienne, Eugene, and Caffarelli, who are more cool than you, may sometimes view things more justly. They are devoted to you, therefore, listen to them; but to them only, and you and I shall be happy.

"I sometimes receive honours here which cause me no small degree of embarrassment. I am not accustomed to this sort of homage, and I see it is displeasing to our authorities, who are always suspicious and fearful of losing their newly-gotten power. Never mind them, you will say; and I should not, but that I know they will try to injure you, and I cannot endure the thought of contributing in any way to those feelings of enmity which your triumphs sufficiently account for. If they are envious now, what will they be when you return crowned with fresh laurels? Heaven knows to what lengths their malignity will then carry them! But you will be here, and then nothing can vex me.

"But I will say no more of them nor of your suspicions, which I do not refute one by one because they are all equally devoid of probability; and to make amends for the unpleasant commencement of this letter, I will tell you something which I know will please you.

"Hortense, in her efforts to console me, endeavours as far as possible to conceal her anxiety for you and her brother, and she exerts all her ingenuity to banish that melancholy, the existence of which you doubt, but which I assure you, never forsakes me. If by her lively conversation and interesting talents, she sometimes succeeds in drawing a smile from me, she joyfully exclaims: 'Dear mamma, that will be known at Cairo.' The fatal word immediately calls to my mind the distance which separates me from you and my son, and restores the melancholy which it was intended to divert. I am obliged to make great efforts to conceal my grief from my daughter, who, by a word or a look, transports me to the very place which she would wish to banish from my thoughts.

"Hortense's figure is daily becoming more and more graceful. She dresses with great taste, and though not quite so handsome as your sisters, she may certainly be thought agreeable, when even they are present.

"My good aunt passes her life in suffering without complaining, consoling the distressed, speaking of you, and writing poetry. For my part, my time is occupied in writing to you, hearing your praises, reading the journals, in which your name appears in every page; thinking of you, looking forward to the time when I may see you hourly, complaining of your absence, and longing for your return; and when my task is ended I begin it over again. Are all these proofs of indifference? You will never have any others from me, and if I receive no worse from you, I shall have no great reason to complain. In spite of the ill-natured stories I hear about a certain lady, in whom you are said to take a lively interest. But why should I doubt you? You assure me that you love me, and judging of your heart by my own, I believe you.

"Heaven knows when or where you will receive this letter. May it restore you to that confidence which you ought never to have lost, and convince you more than ever, that as long as I live I shall love you as dearly as I did on the day of our separation. Adieu—believe me—love me, and receive a thousand kisses."

THE UNITED STATES.

Travels in North America in the years 1827 and 1828.
By Captain Basil Hall, Royal Navy. 3 vols.
8vo. Cadell, Edinburgh.

We sincerely rejoice, that after the crowds of ignorant and trifling people who have lately travelled in the United States, and published their observations, a man of talent, knowledge, and reflection has at last paid a visit to that remarkable country, and spoken out for the instruction of Europe. We have not space in our present number to speak as we should wish of Captain Hall's labours; but we can at least furnish a sample of his manner.

'At present I mean to speak only of New York, which is the most populous, wealthy, and, in many respects, the most important of the whole. This state had recently adopted a new constitution—remodelled from that adopted in 1777,—and it came into operation on the 1st of January, 1823. By this instrument, the legislative power is vested in a Senate and House of Assembly; the Senate, consisting of thirty-two members, who must be freeholders, chosen for four years; and the House of Assembly, consisting of one hundred and twenty-eight members, who are elected annually by the whole people of the state, the right of suffrage being universal.

'I was extremely curious to see how a legislature formed on such principles would proceed, and I visited the capitol with the truest wish to be well pleased with all I saw and heard. The hall of the House of Assembly was not unlike the interior of a church; with a gallery for strangers, looking down upon a series of seats and writing-desks, ranged on the floor in concentric semicircles, the Speaker's chair being at the centre, and over his head, of course, the large well-known picture of General Washington, with his hand stretched out, in the same unvaried attitude in which we had already seen him represented in many hundreds, I might say thousands, of places, from the capitol at Albany to the embellishments on the coarsest blue china plate in the country. Each member of the house was placed in a seat numbered and assigned to him by lot on the first day of the session.

'After prayers had been said, and a certain portion of the ordinary formal business gone through, the regular proceedings were commenced by a consideration of the fourth chapter of the Revised Laws. It appeared that a joint committee of the two houses had been appointed to attend to this subject, and to report the result of their deliberations. The gentlemen nominated had no trifling task to perform, as I became sensible upon a farther acquaintance with the subject. All the existing laws of the state, which were very voluminous, were to be compared and adjusted so as to be consistent with one another; after which, the result was printed and laid before the legislature;—so that each chapter, section, and clause might be discussed separately, when, of course, the members of the Committee of Revision had to explain their proceedings.

'Some of the chapters were so completely matters of form, and related to topics upon which no particular interest was felt, that they passed without any opposition. Others, again, which it was supposed would cause no discussion, proved sources of long debate. On the first day I attended, I was sorry to hear from an experienced friend, that in all probability there would be no discussion, as the chapter, No. IV., which related to "the rights of the citizens and inhabitants of the state," was one so perfectly familiar to every native, that it must pass without delay. When the third section, however, came to be read by the clerk, as follows, a subject was started which led the assembled legislators a fine round. "A well-regulated militia," said this clause, "being necessary to the security of a free state, the right of the people to keep and bear arms cannot be infringed." Upon this being read, a member rose, and objected to the article as illogical in itself; and even granting it were altered in this respect, it was totally needless, as the same clause was distinctly given, not only in the constitution of the United States, but in that of the state of New York; and, finally, it was quite out of place in the statute book. This appeared simple enough; but another member got up, and vehemently defended the revisers of the laws for having brought forward this chapter, and this particular

section; adding, that if ever the Americans relaxed in their exertions and reiterated declarations of what were their rights, their liberties would be in danger. A third gentleman followed, and declared himself so much of the opinion of the first speaker, that he should move, and accordingly he did move, that the whole chapter relating to the rights of the citizens, be rejected, as out of place. This led to a warm discussion by four or five members, none of whom spoke above a few minutes, excepting one, gentleman, who addressed the House, now in "committee of the whole," as it is called, no less than five times, and always in so diffuse and inconsequential a style, that I could with difficulty comprehend how he had earned the reputation of a close reasoner, which I found him in possession of. He not only objected to the article alluded to, but, without the least pretence of adhering to the subject under discussion, or to any thing analogous to it, read over, one by one, every article in the chapter, accompanying each with a long commentary in the most prosy and ill-digested style imaginable. During this excursion among the clouds, he referred frequently to the History of England, gave us an account of the manner in which Magna Charta was wrested from "that monster King John," and detailed the whole history of the Bill of Rights. In process of time, he brought his history down to the commencement of the American revolution, then to the period of the declaration of independence—the articles of confederation—and so on, till my patience, if not that of the House, was pretty well worn out by the difficulty of following these thread-bare commonplaces.

'The next member who spoke declared his ignorance of Latin, and his consequent inability to study Magna Charta—which, I presume, was a good joke—but thought that, if these occasional opportunities were lost of impressing upon the minds of the people a sense of their rights, their immediate descendants, who were not so familiar, of course, as they themselves were, with the history of their country, to say nothing of posterity, would gradually forget their own privileges; "and then," said he, "the Americans will cease to be the great, the happy, and the high-minded people they are at the present day!"

'At length a man of sense and habits of business got up, and instantly commanded the closest attention of the House. He had been one of the committee, he said, appointed to revise the laws, and as such had voted for the insertion of the particular clause, not from any great or immediate good which it was likely to produce, but simply because it was consistent with other parts of the American Government, and because it was suitable to the present genius of the people, to make these frequent references to their rights. "Here," he observed, "is a fair opportunity to enumerate some of these rights, and I trust the committee will see the propriety of embodying these few but important precepts in the revised code of laws which is to become the standard authority of the state."

'I imagined this clear explanation would put an end to the debate; but the same invincible speaker who had so frequently addressed them before, rose again, and I don't know when the discussion would have ended, had not the hand of the clock approached the hour of two, the time for dinner. A motion to rise and report progress was then cheerfully agreed to, and the House adjourned.

'I do not pretend to have done justice to this debate; in truth the arguments seemed to me so shallow, and were all so ambitiously, or rather wordily expressed, that I was frequently at a loss for some minutes to think what the orators really meant, or if they meant any thing. The whole discussion, indeed, struck me as being rather juvenile. The matter was in the highest degree commonplace, and the manner of treating it still more so. The speeches, accordingly, were full of set phrases and rhetorical flourishes about their "ancestors having come out of the contest full of glory, and covered with scars—and their ears ringing with the din of battle." This false taste, waste of time—conclusions in which nothing was concluded—splitting of straws, and ingeniously elaborate objections, all about any thing or nothing in the world, appeared to me to arise from the entire absence of those habits of public business, which can be acquired only by long-continued and exclusive practice.

'These gentlemen were described to me as being chiefly farmers, shopkeepers, and country lawyers, and other persons quite unaccustomed to abstract reasoning, and therefore apt to be led away by the sound of their own

voices, farther than their heads could follow. It is probable, too, that part of this wasteful, rambling kind of argumentation may be ascribed to the circumstance of most of the speakers being men, who, from not having made public business a regular profession or study, were ignorant of what had been done before—and had come to the legislature, straight from the plough—or from behind the counter—from chopping down trees—or from the bar, under the impression that they were at once to be converted into statesmen.

'Such were my opinions at this early stage of the journey, and I never afterwards saw much occasion to alter them; indeed, the more I became acquainted with the practical operation of the democratical system, the more I became satisfied that the ends which it proposed to accomplish, could not be obtained by such means. By bringing into these popular assemblies men who—disguise it as they may—cannot but feel themselves ignorant of public business, an ascendancy is given to a few abler and more intriguing heads, which enables them to manage matters to suit their own purposes. And just as the members begin to get a slight degree of useful familiarity with the routine of affairs, a fresh election comes on, and out they all go; or at least a great majority go out, and thus, in each fresh legislature, there must be found a preponderance of unqualified, or, at all events, of ill-informed men, however patriotic or well-intentioned they may chance to be.

'On the same distrustful principle, all men in office are jealously kept out of congress, and the state legislatures; which seems altogether the most ingenious device ever hit upon for excluding from the national councils, all those persons best fitted by their education, habits of business, knowledge, and advantageous situation of whatever sort, for performing efficiently the duties of statesmen: while, by the same device, the very best, because the most immediate and the most responsible sources of information are removed to a distance; and the men who possess the knowledge required for the purposes of deliberation are placed out of sight, and on their guard, instead of being always at hand, and liable to sudden scrutiny, face to face, with the representatives of the nation.' Pp. 29—37.

REAL PROPERTY REPORT.

First Report made to his Majesty by the Commissioners appointed to inquire into the Law of England respecting Real Property, Inheritance, Dower, Curtesy, Fines, and Recoveries, Prescription, and Limitation of Actions. 8vo. pp. 114. Clarke. London, 1829.

If there be one circumstance more cheering than another for the future prospects of society, it is the suspicion which is awakening in every class, that the old boast about our national perfection is the mere dream of ignorance and conceit; and that though we have been blessed with the privilege of sitting at the feet of our ancestors, we have not imbibed from them—simply because it was not in their power to bestow upon us—the full measure of wisdom that is to fall to the lot of humanity. '*Dans un temps d'ignorance*, says Montesquieu, '*on n'a aucun doute*,' and wrapped up in a state of contented ignorance, in which we never dreamed of doubting, we did not so much as conceive the possibility of imperfections in any part of our institutions; while knaves and bigots were not wanting, in the varying departments of our social relationship, to bind the bandage still closer around our eyes. But now, not the winter, but the spring time 'of our discontent draws nigh.' The frost under which our national energies had stagnated is unsealing,

'*Solvitur acris hiems gratâ vice veris et Favoni*,' and in this moral thaw new channels of thought are bursting from their fountains, and all society displays the symptoms of life and activity. Responding to the public impulse, even dedicated classes have come forward, and applied themselves with zeal and honesty to the renovation of their respective departments; and we see symptoms of a day approaching in which we may hope to jostle honest men in the streets, instead of having to go about in search of them with lanterns.

The Report which stands at the head of our article is a creature of the times. Whether it be to a complete revolution of the whole system of our jurisprudence that we are ultimately to look for a substantial reform in the laws of real property, is a question on which much difference of opinion is entertained, and we do not now pause to canvass it. It can scarcely, however, be denied, even by the warmest advocates of the revolutionary process, that, in the mean time, until a new organization be adopted, much good may be done by working upon and ameliorating the old—by lopping off its redundancies, expunging its fictions, simplifying its modes of action, and for certain insulated rules and principles produced in the temper of a by-gone age and a different condition of society, substituting others more conformable to the spirit of our own. Thus speaking of the defectiveness of the modes now in use for the transfer of property, the commissioners say, in their Report,—

'This proceeds in a considerable degree from rules and maxims which once were suitable and rational, being maintained when the state of society and the modifications of property are changed. *** A long succession of upright and able judges have corrected many abuses, and introduced many improvements; yet their decisions have occasionally exhibited a strange vacillation between rigid adherence to technical forms and respect for the principles of enlightened jurisprudence. They have found themselves unable to break through principles purely arbitrary. Thus, although military tenures have long been abolished, the incidents of military tenure are still often referred to in judicial argument; and the manifest intention of the parties to a deed is at this day liable to be defeated, because the law supposes there must always be a tenant seized of the freehold to attend the lord's court, and to defend any real action that may be brought by an adverse claimant.'—P. 7.

It is to this *corrective* rather than to any *substitutional* system of reform that the commissioners have addressed themselves; and we think we may pronounce that in the execution of their task they have neither betrayed a disposition to shrink from the exposition of evils, nor the warp of professional prejudice to induce them to underrate their extent.

They state that they 'have proceeded to examine the existing state of the law of real property in this country, and to consider how far it may be corrected and improved in its two great divisions of *enjoyment* and *transfer*.'

Under 'enjoyment' they include those modifications which, whether for good or for evil, are rather the creatures of national taste and habit than of law, and fall less within the province of the lawyer, as such, than of the political philosopher; as, for instance, the restrictions upon the establishment of perpetuities, the limitations of entails, and the modifications of the testamentary power. Those are accordingly briefly dismissed with a sweeping tribute of praise, the justice of which it is not now our province to inquire, and it is to the latter alone 'the modes in which estates in real property are created, transferred, and secured,' that the attention of the commissioners is directed. On this, the present Report is but the first of a series, and indeed it is prefaced with the observation,—

'We feel we have as yet made but little progress in the wide field of investigation presented to us. The whole law of real property is so connected, that alterations to be recommended in one branch cannot be definitively arranged without an understanding as to the manner in which others are to be regulated; and if any legislative measures are to be founded on our suggestions, it may be expedient that they should all be brought forward at one time, as parts of a systematic reform.

'We trust, nevertheless, we shall not be thought to have exercised unwisely the discretion vested in us, by thus early stating to your Majesty the course we are pursuing and the opinions we have formed. On some important questions we have, after much deliberation, arrived at conclusions which we now venture to announce for the consideration of your Majesty. We conceive that it will be an advantage to us to act under the public eye;

and from the free discussion to which the Report of our proceedings will probably give rise, we anticipate much useful information and assistance in the further prosecution of our labours.'

The immediate subjects of the present Report are Inheritance, Dower, Curtesy, Fines, and Prescription and the Limitation of Actions. Each is prefaced with a sketch of the law relating to it, drawn up with so much perspicuity, that if it cannot, according to the old proverb, be read running, it may at least be understood with a reasonable portion of attention.

With respect to Inheritance, the two most important points to which the attention of the Commissioners has been drawn, are the exclusion of the ascending line, and of the half-blood.

In consequence of an idiotic maxim of law, founded upon feudal principles, whenever a proprietor dies, leaving lineal ancestors, however near, not only do more remote relations succeed to his property, in preference to these, but, in the absence of collateral relations, under no circumstance can they take at all. Thus, to use the language of the Report—

'An estate may pass to the younger brother of the father, and upon his death it may pass to the father as his heir; but rather than go at once to the father or the mother of the deceased proprietor, the law directs it to escheat, that is, to fall for want of an heir, to the lord of whom the land was holden; that is, in most cases, to the Crown.'

And again, in reference to the half-blood.—

'It has been laid down in the above statement, that collateral relations, in order to be let in to inherit, must be of the whole blood of the person from or through whom they are to derive their claim. Thus, a brother of the deceased proprietor by the same father, but a different mother, cannot inherit to the deceased proprietor, whether he took by purchase or descent. The estate will rather escheat; and the same is the case with an uncle, half-brother of the father, and so on. This rule, like that which excludes the lineal ancestor, has long been felt to rest on no sound principle, and to be hard in its operation.'—(p. 11).

Both rules, it is accordingly proposed to abolish; introducing in one instance, on failure of lineal descendants, the direct ascending line, in preference to collateral, and in the other, subject to a preference in favour of the half-blood, as between persons claiming through the same ancestor, destroying altogether the distinction between whole and half-blood.

It is pretty generally known that, under the present system, the wife is entitled to dower, out of all lands of which the husband was seized, for what is technically termed a legal estate of inheritance, at any period during the marriage. Upon equitable estates, however, or those in which the husband, instead of being invested with the legal seisin, is possessed only of the beneficial ownership, dower does not attach. But the Commissioners state that dower, instead of a substantial benefit to the wife, has in practice been only found an incumbrance on the transfer of property, and it is now almost the universal custom, on taking conveyances of estates, to have recourse to an artificial contrivance described in the Report as—

'A conveyance to uses, to bar dower which, while it confers the whole beneficial ownership, and an absolute dominion over the legal estate, prevents the legal estate so vesting in the purchaser as to make the property subject to the wife's dower.'—(p. 17).

Many inconveniences, however, have been found attendant upon this contrivance, and the title of dower itself, when the precaution has not been taken, giving birth to many more, it is proposed as a remedy, to abolish its existence, except upon property of which the husband may happen to die possessed, but to extend its attachment as well upon that of which the husband was entitled only to the equitable ownership, as to that of which he was seized of the legal estate. This will have the double advantage of abolishing an absurd distinction, and of removing an impediment to the transfer of property.

The law of curtesy, it may be as well to premise, that which gives to the husband an estate for his fe, in the real estates of his wife, in the event of his arriving, conditional on his having by perception of rent, or other similar act, obtained during the life of his wife, what the law terms 'a seisin in fact,' and upon there having been issue of the marriage. Both these conditions it is proposed to abolish, with a provision that the right by curtesy should be restricted to a moiety only of the estate when the wife may have died leaving issue of a former marriage inheritable to it.

But the most sweeping cleansing out of the great Augean is to be found under the head of 'Fines and Recoveries.'—After an admirable exposition of the manifold mischiefs and absurdities of these assurances, the Commissioners boldly recommend for their costly and cumbrous machinery, the substitution of a simple declaratory instrument.

We believe there are few branches of the law, the opping of which would be attended with greater advantages; and most cordially do we agree with the Commissioners in the confidence with which they express their opinion—

'That the abolition of them would be highly beneficial to the owners of real property, while it would relieve both counsel and solicitors from much useless learning and responsibility.

'Several centuries,' says the Report, 'have passed since fines and recoveries were first used as common assurances. With some exceptions they seem to have been since looked upon with a sort of veneration by successive generations of lawyers, who, from their having formed part of their legal studies, and from the working of the machinery, having grown familiar [we might add profitable] to them, have become insensible to the consideration that their utility arises solely from the circumstance, that the law has provided no simple and direct means of effecting the important objects, in regard to real property, to which these processes have been, as it may be said, forcibly applied. So powerful is habit, that men are satisfied with the effect produced, and disregard the intricacy and the expense of the process, and the dangers to which it leads.'—(p. 31).

From the universal concurrence which seems to prevail upon the propriety of abolishing them, however, it appears that this veneration has now subsided; and we believe fines and recoveries will go to their long home without so much as one funeral dirge to show the respect of the lawyers to this remnant of our Protestant Constitution.

The last subject of Report—Prescription and the Limitation to Actions,—is one of considerable importance to every purchaser, and indeed to every possessor of property. At present no possession short of sixty years is capable of conferring an absolute title to lands, and in those in which there are interests created to take effect upon the termination of a previous estate tail, so long as there remain issue inheritable under that entail, unless the entail itself have been destroyed, no period, however long, will bar those interests, and the right to them may accordingly remain in existence for centuries. The consequence is, that in purchases of land, not only has the title in every instance to be investigated for full sixty years back, but, if there be any reason to suspect that there have been, though at a remote period, interests created to take effect upon the termination of an estate tail, the title has to be carried back for a much more remote period to ascertain the reality of their existence. It is obvious that this examination cannot be conducted without prodigious cost and trouble, and the difficulties of carrying it to a successful termination often prevent the sale of the property. Yet does the occasion for all this exist to no purpose, or a bad one; for either the object is to secure protection against individuals, who, in their ignorance of their rights, are as likely to lay claim to the empire of China as to the property in question; or else it is impolitic, after a long continuance of enjoyment, to allow men to be disturbed in their possessions by those whose neglect has operated as a sort of tacit confirmation of title, or to whom, in the balance of pains and pleasures, the gain would not weigh a

feather in comparison with the loss to be sustained by the other party. Nor is this all:

'The statutes,' say the Commissioners, 'which have been passed to create or vary the periods of limitation, have had no regard to uniformity or consistency, and have laid down rules which do not depend upon the nature of the right to be acquired or defended, but upon a number of technical distinctions, with reference to which a confused and unprofitable variety of remedies is afforded to the claimant.'—P. 39.

To obviate these evils, with exceptions for one or two special emergencies, which we have not space to allude to, the Commissioners propose substituting one remedy, and one period of limitation, for the present heterogeneous jumble of times and actions; and with certain provisions for disabilities, with cases of fraud and trust, they propose twenty years to be the universal period of limitation.

Prescriptive rights to profits and easements to be taken and enjoyed over the soil of another, present still greater difficulties in dealing with them than other species of property, for the title to these can only be established by either proof, or presumption taken as a substitute for proof, of an adverse enjoyment from so remote a period as the coronation of King Richard I. To date the period of prescription from the time of Noah's coming out of his ark would be scarcely more absurd; and the Commissioners propose substituting 'for this time,' as it is called, 'whereof the memory of man runneth not to the contrary,' the more rational legal memory of sixty years.

The Report ends with allusions to subjects of future inquiry, and the formal draughts of the propositions on the subjects of this.

The specimen which the Commissioners have thus given of their labours, entitles them to the confidence of the public; and we trust no evil genius will arise to turn this Report into what it has been too often the fate of many good reports on the subject of law and other reform to become—'*vox et preterea nihil.*'

THE BRUNSWICK.

The Brunswick, a Poem. In Three Cantos.

"Fallen, fallen, fallen, fallen."—Dryden.

8vo. pp. 108. Marsh. London, 1829.

THIS is not as we feared a poem or a denunciation concerning his Majesty's Protestant rebels in Ireland. It relates to a matter now well-nigh forgotten; and is so clever that we wish its author had treated a subject of more stirring interest. The great fault of the poem is, that it adds nothing (but more careful execution) to a style created by Byron, and sustained by him with as much talent as is likely ever to be employed in a similar fashion. The sudden change from groans and agony to mocking laughter, the easy verse, the rapid picturesque, and often grotesque delineation, the odd startling rhymes, the satire, and the eloquence, the very form of the stanza, all are here as they are in *Don Juan*. And we really know not that any Englishman alive can write more fluent and sparkling verses than those before us. The author, however, would do more wisely if he would abstain in future from direct and continued imitation of eminent men: he is clever enough to stand alone; and will never gain more than a fifth rate reputation by leaning on another man's fame. That the style he has chosen is fundamentally vicious we imagine he already knows; and has deliberately made his election. And we presume there can be little hope of persuading the public that its liking for *Don Juan* is as erroneous in criticism as in ethics. We will therefore do no more than make an extract which we think will satisfy our readers on the point which the author, we suppose, was chiefly anxious to establish, namely that he is a very clever fellow.

The nominal subject of the three cantos, is the fall of the Brunswick Theatre:

'In life, as in our voyages there seems,
One mighty moment when the truth comes o'er us;
In life 'tis when the sweet home-sheltered dreams
Of youth subside, and the world stands before us,

The great, bold, busy world, with all its schemes:—
At sea, 'tis when we leave the wave which bore us
All gently near the shore with tranquil motion,
And feel the vast and undeniable ocean.

'Some early rush into life's ocean—some
Bid later farewell to domestic joys:
But soon or late the hour is sure to come,
Which all our early bloom of heart destroys.
Me ling'ring long in the sweet lap of home
Fancy and Hope long cheated with their voice;
Long kept me stranger to the sick'ning strife,
And all the cold realities of life.

'But ah! full sure, the disenchanted came,
And all at once the fairy vision broke;
Hush'd was the voice of hope, the dream of fame,
And bright romance was shiver'd at the stroke;
The sounds I hear around me are the same,
But where the charm in every voice that spoke?
Gone, gone for ever with the light which shone
Within my breast—the charm was there alone.

'What was my heart before?—a joyous dwelling,
Whose chambers echoed to a sparkling throng,
Where infant Hope his hundred tales was telling,
While all the passions listened to his song;
Where music on volupitous gale was swelling,
And life in one bright stream was borne along;
Fancy was there, and Love his garlands wreathing,
And all the flow'rs of life their sweets were breathing.

'Behold it after—many a dreary token
Is scatter'd o'er the halls where gladness rung,
Gay garlands wither'd, and proud arches broken,
And high-toned instruments of joy unstrung;
And many a wish that was in rapture spoken
Hath died away with thoughts no longer young;
While tort'ring memory, like a gloomy ghost,
Yet lingers there, and murmurs, "All is lost!"

'And then we rush into the great gay world,
New-modelling our notions with our state,
The flag of mental freedom is unfurl'd,
And dipp'd in colours of our future fate,
And old opinions from their thrones are hurl'd,
Where they have lain for ages like old plate;
We melt them down, we mould them to our use,
Strong as our feelings, various as our views.

As on we march, the world a thousand ways
Turns from the truth our wayward wand'ring view;
But most the giant Prejudice o'eraways;
With antique garb of many colour'd hue,
Time-rusted sceptre, eye that shuns the gaze,
And specious voice, he lulls his hapless crew,
Who mean their vows for Truth, nor deem them paid
To such foul monster in her guise array'd.

Some Interest guides—some Passion goads along—
Some Pleasure leads in her alluring train—
Some Custom urges with a force as strong;—
These rule the blindfold world, and give to men
Opinions various, violent, and wrong;
Which brings me to my subject back again;
The diff'rent views of people to relate,
About our Theatre's untimely fate.

The largest class in all the King's dominions
Are these who have no notions of their own,
But having fish'd for orthodox opinions,
Adopt them with a grave and solemn tone;
Antiquity's admirers, custom's minions,
Who always are for letting things alone—
These thought, good souls! 'twas providential quite,
That the thing fell by day, and not by night.

'Tis providential when your banker fails,
If you have only half your fortune there;
Among your cattle when the rot prevails,
'Tis providential if it any spare;
'Tis providential, whatsoever ails,
It is not something worse, and I dare swear
'Tis providential when

There happen'd some most wonderful escapes
Upon the morning when the Brunswick fell.
Some call'd it mere good luck in various shapes;
But it's more orthodox, and quite as well

To call it providential—I, perhaps,

May name a few, but should I try to tell
Each case of providential interference,
Before I finish'd it would be a year hence.

One hen-peck'd gentleman had set his mind

On going there quite early, but his wife
Most providentially was disinclin'd

To hurry, so detain'd her dearest life,

Who, as is usual in such case, repin'd,

Grumbled and then gave way after short strife,
And reach'd the Brunswick, sorely vex'd and bother'd,
Just too late by ten minutes to be smother'd.

Another would have shar'd the gen'ral crunch,

But providentially drank over-night

A monstrous quantity of whiskey-punch,

And waking in the morn bewilder'd quite,

Incapable of breakfast or e'en lunch,

He stay'd at home to set his stomach right,

Where bile and acid wag'd a horrid strife,

And nursing thus his liver, sav'd his life!

Another had engag'd to meet a lady,

(Engagements which men punctually attend,)

And at the time was sitting in a shady

Apartment with his fair and smiling friend,

When, had he not this assignation made, he

Must then have met a brick-and-mortar end;

Thus evil may be done that good may come,

A sentence which I us'd to think a hum.'

The Church in Danger from Herself; or, the Causes of her present Declining State Explained. Dedicated to the Archbishops of Canterbury and York. By the Rev. John Acaster, Vicar of St. Helen's, York, and Domestic Chaplain to the Right Hon. the Earl of Mexborough. 8vo. pp. 171. Seeley, 1829.

THIS is a very earnest and spirited appeal to the heads of the Church of England by one of its ministers. He maintains, and proves, we think, to the conviction of every man, that the church is in no danger but from itself, and that from itself, in its present state, it has almost everything to fear. Indifference, negligence, and worldliness, suffered to run their course, unchecked by the operation of ancient and wholesome, but now slumbering laws, are indeed, as Mr. Acaster states and enforces, the great powers at work for the ruin of the establishment. The author is an honest, a pious, a grave, and eloquent man; and, though we might probably differ from him on some serious points of doctrine, would to Heaven that all the clergy were partakers in his zeal and wisdom. Of all the changes that could be devised for the renovation of the church, (on which its safety will necessarily depend), we are inclined to attach the chief importance to a reform in the education of the young men designed for its ministry. But there are few, if any, of Mr. Acaster's propositions which ought not to be strenuously acted on.

Godsberg Castle: a Poem. By Miles T. Stapleton, Author of 'La Pia, or the Fair Penitent.' 8vo. pp. 51. Ridgway, 1829.

THIS is another of the thousand and one signs of the age. It adds nothing to the current thought of our poetasters, but it is strongly impressed with the character communicated to our literature by two or three remarkable men. It is full of the careless, fluent description introduced by Scott, and of the mad contortions of Byron. But we cannot say that it displays a great deal of the genius of either. The cover, however, is roseate, and the story bloody.

Chozar and Sela; or, The Siege of Damascus; and other Poems. By James Fletcher, of Clare Hall, Cambridge. 12mo. pp. 117. London, 1829.

It may be stated as a general rule, that no one in our day can reasonably look either for profit or reputation from a volume of juvenile poems. Mr. R. Montgomery, to be sure, may be cited against us. But he wrote about the 'Omnipresence of the Deity,'

published in quarto, and had his portrait engraved, with the hair curled and parted on the forehead, so as to overpower at once the lovers of luxurious printing, the religious public, and the young ladies. Mr. Fletcher has emitted a very modest volume, and one which we suspect will attract much less attention. We hope for Mr. Fletcher's sake that it may not be panegyricised in periodicals, or sold to the extent of half a dozen editions. He is evidently a young man of considerable and very improvable talent, and we doubt not that he will turn out a person of high merits and accomplishments if nothing occurs to sell his book, and to persuade him that he is already a great poet, because at eighteen he writes very flowing imitations of Lord Byron and Moore. If his book pays its expenses he will inevitably be persuaded that he is in truth a heart-broken outcast, and will spend his time in apostrophising Ahriamenes instead of reading mathematics. It would really be much wiser and pleasanter to become at once 'a gay man' than to go on persuading oneself that the Cam is the Cocytus, and the world a stage on which young gentlemen are designed to enact sublime melancholics.

Westminster Review, No. XXI. London.

'THE Westminster Review' no longer arrays beneath its whity-brown banners that small but obstinate phalanx of reformers, à l'outrance, to which the work has been indebted for its character and station in the field of polemics and of literature. Those serried squares, that iron front of Aristotelic discipline, have melted like the visionary armies of Ossian, before the breath of some impracticable editor or proprietor; and their place has been supplied by bands of light troops and skirmishers, whose tactics are amusingly different. A remnant of the faithful, however, still appear to impart some portion of the old leaven to the present entertaining number. A paper on the *greatest-happiness* principle, in reply to the attack of 'The Edinburgh' on 'Mill's Essay on Government,' ought either to have been better or worse written:—worse, if it was only intended to fight the northern sophist with his own weapons; better, if a hope were entertained of arriving at the real moral basis of political science. A review of 'The Parliamentary Report on the Civil Government of Canada,' is a far more favourable specimen of the 'faith as it is in Bentham,' and is incomparably more worthy of attention than any political pamphlet of late date which has come before us. It forms the sequel to a former paper in the same review on the same subject; and consummates the exposure of a system of ecclesiastical and civil misrule, petitioned against by eighty-seven thousand aggrieved individuals, and condemned by a Committee of the Commons House of Parliament.

The Extractor, or Universal Repertorium of Literature, Science, and the Arts; comprehending, under one general arrangement, the whole of the popular, scientific, valuable, and entertaining articles of interest to the general reader, from the American and English Reviews, Magazines, and Journals. Vol. II. Ware. London. 1829.

WERE this work literally what on its title-page it professes to be; did it comprehend 'the whole of the popular, scientific, and entertaining articles carefully compiled, digested, and methodized from the American and English reviews, magazines, and journals,' it is quite clear that it would be the most discreditable publication that ever issued from the press. As it is, however, the sources whence the matter with which this publication is filled are so numerous and so vast, and many of them, although occasionally containing matter of universal interest, are, generally speaking, so exclusively devoted to branches of knowledge, about which a small class of individuals only concern themselves, that it is doing a service to the public, and a benefit rather than an injury to the works from which the articles are taken, to extract them. The quarterly volume before us contains nearly five hundred and fifty pages of thickly printed letter-press, in double columns, selected from a variety of

periodical publications; but we believe, in only one or two cases are there more than two articles taken from the same journal.

The Life of Mahomet. Published by the Society for Useful Knowledge. 8vo. pp. 32.

THE author of this pamphlet is evidently one of a set whose elaborate and hollow pedantry is infinitely more intolerable than that of the school-men. The forms those logicians might be filled with a spirit of life and creation by a man of genius, and sometimes were so. The affectation of our modern English schoolmen, which they are pleased to call a *method*, is far too narrow and minute to contain any thing much larger than a quibble, though we confess the experiment has not often been tried by its inventors. We have looked backwards a few months to notice the performance named above, because we think it peculiarly unfitted for the purpose which it is intended to serve, and because we are anxious to entreat that Mr. Hallam and Sir James Mackintosh will not permit their names to appear on the covers of any more such productions. This one is chiefly noticable for its author's want of comprehension, both as regards the character of Mahomet and the spirit of his system.

A New and Complete History of the County of York, by Thomas Allen, Author of 'History of Lambeth,' and illustrated by a Series of Views, Engraved on Steel, from Original Drawings, by Nathaniel Whittock. 8vo. Hinton. London. 1829.

OUR readers, we trust, will dispense, without murmuring, with our pronouncing an elaborate opinion on the historical and topographical parts of this publication. In the former, the author, if not elegant, is at least impartial; and in his account of the eventful transactions of which the extensive and populous county of York was the theatre, at the period of the contest between Charles I. and the Parliament, he, wisely considering the probable diversity of political opinion among the readers he would desire to conciliate, contents himself with giving details, without troubling himself to express an opinion.

The illustrations are in general good and appropriate. The best are a view of the sumptuous 'Minster,' 'Heath Hall, near Wakefield;' and 'Hull Docks.' We cannot say so much for the engraving of 'Trinity Church, Leeds,' which is stiff and harsh.

Deutsches Lesebuch, or Lessons in German Literature, by J. Rowbotham. London, 1829.

THE author of this collection, already known to the public by his German and French Grammars, has added, in this publication, one more to the many translations so useful in the study of languages. Although the lessons are neither abundant nor very select, they are better than the collection of Crabb, and more worthy of recommendation than those known under the title of 'Historisches Magazin.' The author, moreover, deserves praise for the attempt to combine in different progressive sections, the Hamiltonian system with the improvements suggested by various philosophical grammarians. The first section, however, in which the method of inter-linear translation is united with a liberal translation, appears confusing, for a beginner, without being of any use to him.

SHADES OF THE DEAD.

NO. I.—MILTON.

ONE of the most remarkable changes in the history of the world is that which has substituted the action of circumstances for the influence of individual character. To questions whether this revolution be useful or mischievous, only the one answer can be returned—that it is necessary. But omitting, for the present, all discussion as to the political results of this alteration, we may yet observe, that nothing can be more pernicious than to let it extend to the moulding of our own minds. For whether any man's well-being can be destroyed by adverse fortune (to which almost all Pagan wisdom and example, no less than Christianity, bear witness in the negative), it is clear that the most favourable accidents can never secure it. Yet our education generally tends to turn attention, not on the virtues and accomplishments of illustrious men, but on the precepts left to us by them, or to be drawn from their lives, for advancing ourselves in society, and prudently governing our conduct.

It would, therefore, be in our age especially useful to set up before the eyes of men, the portraits of the great minds which now exist for us only in their thoughts or actions; and to display them for the reverential love of later times in their living personalities, and surrounded, as golden statues in a temple, by unstained and sacred air. Such tasks are not dear to those whom profit or vanity has made skilful in bookcraft, and the attempt is thus remitted to workmen who want perhaps almost every quality required for its success, but the earnestness with which they would willingly devote themselves to its achievement.

Milton stands apart from nearly all the men who hold a permanent place in the estimation of the world. With scarcely an exception, their memories are still, as it were naturally joined to the affairs of society. Shakspeare is read perhaps less for his poetry than for the number of practical maxims, and sayings, and descriptions of general application which crowd his pages. Newton retains his place in fame by the physical direction of his pursuits. Bacon is crowned with both these diadems. But the fourth great name of England dwells aloft, and equally remote from the business of the day and the studies of natural philosophy. The merchant cannot learn from him to grow rich. He has left no proofs to the mathematician. The man of the world can find in his writings no directions for his carriage in courts and assemblages. In the eyes of the present generation his political opinions are an obsolete fancy; his system of church government a baseless dream; and his plan of education but a grotesque rarity for literary museums. He is even hateful to many for his defence of regicide; he is distasteful to more for his heretical doctrine; the works which employed the longer portion of his life are difficult and gloomy, and now half hidden by the rust and cobwebs of the two centuries which have introduced to popularity such different theories from his; his poetry, to persons who read for amusement, is far too massy and learned, and furnishes food but little grateful to the majority of those in whose views his religion is not contemptible.

Whence then comes it that he is still spoken of as a bright and almost an awful spirit? It assuredly does not arise from the merely accidental conformity of a few of his opinions with those of some modern politicians. They employ his eternal name for their own low momentary purposes. They use a forensic lens to kindle from that sun their heaps of weeds and so breed a stench in the nostrils of their enemies. But he spoke so little to the crowd, he lived so long ago, his faith was so sincere, and his morality so exalted, that he will never receive from them that cordial idolatry which rewards their recent champions. He has lately been panegyrised by them in this country, as the Bible when it was taken to Rome after the sack of Jerusalem might have been applauded by some Greek adventuring rhetor-

ician, who had looked for an hour into the volume. And neither can the reverence felt for him be explained by the religious frame of his longest poem. For some of our most admired religious authorities have declared that the Rev. Mr. Pollok's 'Course of Time,' is superior to 'Paradise Lost.' Pure poetry will not maintain an author in the thoughts of Englishmen, or Spenser would not be almost forgotten. There must be some cause different from all these for our national admiration of Milton, and it can be found in nothing but the dignity of his character. That, careless as the learned and the popular are becoming of such titles to renown, is still a claim on the sympathy of mankind; and so it must ever be, unless we shall sink into a horde, externally civilized, but morally uncultivated.

Milton was abundantly skilled in the dialectic art; he had a divine intuition into the logic of poetry; but he was not particularly remarkable, among men of genius, for penetrating and comprehensive intellect. This is very clear from his political and theological writings. His 'Scheme of Government,' is that of a purely ideal commonwealth, and has the fault common to the greater number of such conceptions, that it never could be practised except among beings for whom no government at all would be necessary. His opinions as to a Church Establishment are of exactly a similar description. And no imagination less powerful than his could have realized such visions to any mind. Nor could these phantom plans have obtained in the thoughts of a nation the living force necessary to their action, unless every man had been able to breathe into them from himself a breath of existence as powerful as that with which they were imbued by their Creator. But this could not be. The roots by which institutions hold to the minds of most men and draw nourishment from them, are custom and antiquity, far more than the feeling of security, the love of order, and the reliance on acknowledged right, which influence the few thoughtful heads. Milton cut off these roots in himself, and nourished his theory by stronger and deeper ones, penetrating below the surface into the reason and freedom of his nature. His plans are glorious manifestations of his character. But in politics no more than in poetry could he lay aside the austere and magnificent individuality of his mind, and think for others from a knowledge of what they are, instead of considering them as repetitions of his nobler self. He knew little of the tangled complication of modern society, of the reciprocal action of various classes, which have grown up and been sanctioned by centuries, of all the differences made by the increasing importance of property between the commonwealth of England and that of Rome. He saw, in his idea of Rulers, the combined elements of a moral and a civil guardianship, resembling, but for their elective title, an old priestly aristocracy. The people were, in his eyes, a body whose freedom would best be secured by obedience to these governors; and he took but slight account of that great middle mass of unripe active intelligence which did not exist in the ancient world, but of which the power over civil affairs and literature is the most remarkable characteristic of modern times.

His political opinions with regard to circumstances are of little value as rules for practice. He did not belong to the age in which he wrote, nor peculiarly to any age. He saw no more of the subtle springs and interwoven tendencies of his own day than of any other. He would have walked as much alone in the time of Elizabeth as in that of Charles. And though living in any period of public movement, he would have flung his gigantic shadow over the field of battle contested by dwarfish combatants; his motives would have been entirely different from theirs, and he would have stridden among them without belonging to either faction, though turning perhaps the victory at his will. His political treatises can teach the active statesman very little, but they are splendid and living evidences, for him who reads aright, of the freedom and earnestness which were as necessary to the mind of Milton, as the air of heaven to the world of animal existence. They are

more than this; they are memorable assertions of that possible freedom of human nature, which, though incapable of being made the broad ostensible basis of a government, must be more or less implied in every polity designed to hold together beings at all superior to the brutes. In them, as it were he calls to witness God and man, that liberty is our natural inheritance; and though not knowing or heeding that where it does not exist in the minds of men, institutions pretending to embody it must be hollow and dead, he is yet an inspired moral teacher, proclaiming that for freedom in himself it is every man's first vocation to labour, and his second to struggle for its recognition in the laws of his country. And thus it is, that where it was possible for Milton to succeed there he was successful. He taught to all Europe that the death of Charles was not a mere violence of an aimless and criminal faction, but a deed which could alone make evident the birth and rigour of a new power, a hitherto unheard-of self-reliance among the citizens of a modern state. The execution of that sovereign (than whom a falsar and more treacherous never existed) is now maintained by almost all men to have been both foolish and wicked. But in how different a spirit was it defended by Milton from that in which it was treated of by the Royalists, who condemned it, not as a separate offence, but as part of a rebellion more just and necessary than any foreign war that England ever waged. And mistaken though he probably was in his defence of the English people, let us not forget how nearly the language and doctrines of that mighty pleading are akin to those of the *Areopagitica*, the first great proclamation of a principle which has now become the most familiar and most valuable inheritance of every one among us.

His views of church government are indeed far more opposed to any thing that could safely be practised, than his political theories. But we may draw from them at least the moral of the utter worthlessness of hierarchies and ceremonies without our own co-operation. To Milton such aids were unnecessary. The ladder is needless for him who has an angel's wings. But he has taught us more eloquently than almost any man, that the very ladder of God will not enable the cripple or the sluggish to mount to heaven. In this, in all, he contends for the activity and freedom of the individual mind. It was the treasure which he unceasingly guarded; it was the citadel which he spent his life in defending; it was the faith of which he was the great apostle. And what though he overlooked the humble needs of the wayfaring Christian, who fears to stand alone least he should fall; the time shall come when the meanest and the weakest will be lifted side by side with Milton, and feel that they are upheld by that inward and self-subsisting force on which they now dare not rely.

Nor are his poems less remarkable than his prose writings, for the evidence they afford of the personal loftiness and concentration of his character. It was the glory of Shakspeare to make himself master of the universe as it is; and on that account there is no conjunction of affairs, no subtle variety of character, to which some passage of his dramas is not applicable. It was the glory of Milton to create for himself a universe of his own; and, therefore, every line of his works shows to us an instance of the employment of ordinary materials in relation to a high, internal, moral end. Shakspeare modelled out of his own pure metal a bright image of every thing around him, and a thousand noble human sculptures. The great blind poet collected all that the world could supply of valuable, and melting it into one rich Corinthian substance, cast with it a statue of himself, exhibiting man in his most divine form, and to be recognised by men as long as they shall retain their likeness to God.

Milton's independence of his age, and of all but the laws of his own excellence, is no less remarkable in these poems than in his other writings and in his life. He was in faith a Hebrew prophet; and in knowledge and culture a Greek philosopher. 'Paradise Lost' is the noblest mythological creation that

ever existed. It does not connect itself indeed with the popular belief of any time or country; for Milton of all men was least able to throw himself into another set of thoughts than his own; and those who demand that he should have done so, and lament that his angels are not the angels of our childhood, nor his fiends the devils of a puppet show, forget that the living principle of Milton's being, his sublime and statue-like *aloofness*, must have been destroyed before he could have thus written. Conscience was the moving power, imagination the great instrument, of his mind. For the sport of fancy, the agility of busy Intelligencer he had little propensity.

It is curious to observe how the general opinion has decided with regard to the relative merit of his poems. 'Paradise Lost' is, by the consent of almost all, the greatest poem of England; while 'Paradise Regained' is scarcely more familiar to the majority of educated persons than 'Gondibert,' or 'The Purple Island.' The one which images the struggle and agony of the universe in the task of self-determination, which contains the gigantic impersonations of evil, and the disastrous rout of human hope, finds an apt correspondence in the breast of every one. But the lovely child of the old age of Milton, the serene proclamation of the power to conquer, the even and majestic triumph of tempted humanity, has perished from the memory of the nation as completely as if it had been laid in the sepulchre of its author.

Until there is a stronger inclination to raise out of that oblivious dust what remains to us of his productions, there is but little chance that we shall think of erecting and vivifying the image of himself; yet around what retired student does so calm a glory rest as that which encircles Milton? From his age, so fertile in the greatest men, we look in vain for his compeer, and shrink from setting in comparison with him the perturbed spirit of Vane, the virtue of Falkland, slender and feeble, though pure as diamond, or the less austere morality of the pregnant and fervid Taylor. We see Milton surrounded by a conflict, for humble honesty the most fearful that can exist; but we see him passing through it triumphant. Unlike Hobbes, the cowardly sophist, who fled from England at her utmost need, he left the land which his education and tastes made dear to him above all others, and which he could scarcely have hoped again to visit; he broke away from a train of affectionate admirers, and the ennobling sphere of the old Roman greatness, and came to submit himself to the whirlwind by which his country was shaken. The days of a life which more lately bore the fruit of the 'Paradise Lost and Regained,' he employed in the toil of teaching, that he might devote his nights to the composition of treatises splendid enough to have dazzled a world, but that they were too lofty to engage the vulgar eye. In an age rioting with drunken opinions, he, too, was sometimes misled by a finer and more spiritual intoxication. But the man is untouched by the condemnation which lights on the intellectual error; his heroic, if not rather angelic, excellence remains undimmed, unapproached by censure; suspicion dares not look his memory in the face; his name stands among us as a monumental pillar, elevated enough to be a standard for human nature, and of which stain or decay cannot reach the lowest stone in the pedestal.

He may have erred as to divorce; but it was not from the strength of sensual passion or the weakness of conscience. He overlooked a thousand prudential considerations as to government; but from no want of reverence for the principle of law, or love for all that can maintain, purify, or exalt society. And if in moulding his idea of a church, he forgot that the limit which restrains may also secure and support, how glorious was the error (if the wretchedness of any error can ever by relation be glorified) compared to that of men who would compress and enslave the freest and the most self-sustained spirit on earth, even such an one as that of Milton himself.

Nor is he merely this severe and complete model, awful and holy, but as he is sometimes described,

scarcely at all engaging. The altar-flame which burns on the sacred mountain lighted also with a genial and kindly ray the low domestic hearth. He loved the country, and society, and cheerful books; and delighted in all the cordial elegances and delicate graces of life as keenly as those who far from being able to write the 'Defensio Secunda,' have never even read it. There is all the simplicity and all the liveliness that good Isaac Walton would have desired, in the glimpses that remain to us of his private life. We read of him inviting Mr. Lawrence or Cyriac Skinner to converse with him over wine, and thus to enjoy a pleasure, of which

'Who can judge and spare
To interpose it oft is not unwise.'

We hear of him composing an unrivalled poem in honour of a young lady, at the request of his friend Mr. Henry Lawes. And she, the heroine of 'Comus,' by a singular felicity, after the glory of being celebrated by Milton, achieved the greater glory of protecting Jeremy Taylor. How familiarly does he seem to have conversed with Elwood and his other friends about that which men are often jealous of seeing handled, the progress, namely, of his writings. How profoundly did he love the wife to whom he addressed that most saintly sonnet. And how beautiful, calm, and clear are the hints that remain to us of his latter days, when wrapped with a coarse grey coat, he sat in summer evenings among the flowers at his door, and rejoiced in the fresh air of heaven; or when more solemnly suited with black, he was placed in a room hung with faded green, and bent his pale sightless countenance over the organ on which he delighted to play. And amid the smoke and fury of the fiercest political battle waged in England since the Reformation, with what exquisite sweetness and modest sublimity does he recur to the romances in which, as a boy, he had looked for amusement; and from which, by the necessity of his own nature, he had drawn instruction and moral nourishment.

He had scorn, indeed, and vehemence for all the basenesses that met his eye. But let us not forget that the meekest Being who ever existed drove the money-changers from the temple with a scourge, and threatened to purge the garner with a terrible and destroying fan.

THE NORWEGIAN KNIGHTS IN THE SANDY DESERT.

From the German of La Motte Fouqué.

RUTBERT.

My Adelhard, of all the knights our Norway's snows
Have poured abroad to seek adventures and renown,
None ever had to bear a lot so hard as ours:
Here underneath the parching glow of Afric suns
To burrow through the desert by our mail weighed down,
With strange and loathsome beasts of prey to clog our
spears,
Or sometimes a magician, slight more ghastly still,
Who reels and sprawls and stains the ground with his
black gore.
In truth our brethren's tasks are nothing but mere sport:
Whether in ships they shave round cliffs stark stiff with
ice,
Or make the Asian Paynims bleed and fall and fly:
Whatever be their fate, 'tis bliss compared with ours.

ADELHARD.

What doomed us to these toils, my friend, but our own
choice?
Those chains alone rub sorely, which a stranger bound;
Not the arms we braced ourselves rejoicing in our
strength.
Slaves only murmur. To be free is to be glad.

RUTBERT.

True! But no man can keep in one unvarying mood
For years together. Times change strangely; so will
men.

What at one moment lifted us above the stars,
Will at another almost weigh us to the ground:
Almost indeed, not quite. A knight's heart still is true.

ADELHARD.

Aye! or he must have always been a recreant knight.

RUTBERT.

And thou couldst never deem so meanly of thy friend:
Of that at least I feel assured, my Adelhard.

ADELHARD.

Thy lance may sleep in peace amid the grass and flowers
Of this our desert garden: for I mean thee well.
Thou'lt never need thy spear against thy Adelhard.

RUTBERT.

I'm glad of it, e'en from the bottom of my soul.
It were sore pity that a quarrel should arise
Betwixt two knights whom God has blest with such
strong arms;
Whom every pilgrim wandering through the desert seeks,
As pillared rocks amid the sandsea standing firm;
In whom too all the dwellers on the blooming coast
Trust that our spears' sharp moving hedge will still fence
off

The wild barbarian race that haunt this weird waste;
Yes, who are known throughout the earth by one proud
name,

The giant pair, in friendship wondrous and in strength.

ADELHARD.

And yet, my Rutbert, yet thou murmurest at thy lot.

RUTBERT.

'Tis only that our mighty never-ceasing toil,
Though it bears fruit, bears such a thin and scanty crop,
As stands in no proportion to the gardener's pains.

ADELHARD.

Where will you find a gardener in this earthly world,
Who may not echo back that melancholy cry?
Whether with spade or pen, with sickle or with sword,
His taskwork be performed, one thing is always sure:
A perfect fruitage never will reward his toil.
This is because the world is fallen away from God,
A poor weak thing, that sins in dreams, and dreams
through sins,
Yes! doth not God himself give much, whence little
comes?

But let not mortals therefore idly fold their arms.

RUTBERT.

Behold that slaughtered lion there beside the brook,
That tawny serpent's rigid folds beamed with sand.

ADELHARD.

I know, 'twas thy brave arm that laid them prostrate
there.

RUTBERT.

Is that the way an idle dreamer folds his arms?

ADELHARD.

No truly! thy droll question makes me laugh outright.
But there's another duty, never to allow
Black vapours to o'ergloom our free and open hearts,
Driving fresh confidence from thence and cheerful joy.
All obstacles, when boldly clutched with fearless hand,
Will lose their sting, and only make our spirits leap.
But wherefore lookest thou thus astonished in my face?

RUTBERT.

I know not, can this be the selfsame Adelhard,
Who used so oft to wrestle with his fate of yore,
Whene'er it placed a burthen on his haughty neck?
And now forsooth—I thought, when thy pledged word of
late

Called thee away to Italy for knightly feats
From these our sandy posts of drudgery, of a truth,
When he returns from all those gaily sparkling climes,
His grumbling will keep time with the angry growling
winds,

And give them back their never-ending hollow mean.
Thou art returned; and preachest mirth and patient
cheer.

What wrought the marvel in thy once impatient breast?

ADELHARD.

Most gladly will I tell thee; but, if thou approve'st,
Would rather breathe it in the blither tones of song.

RUTBERT.

Ay surely! 'Tis the ancient custom of the North.
Sing on, my honest Adelhard, with lusty voice.

ADELHARD.

Midst of mountains
Flows a valestream,
Far gentler, more sure than our beloved Norway's
streams;
Softer the hill-slopes,
More leafy their trees,
Greener their carpet that yields to the maiden's foot.

But in this fairy scene
Many a ragged peak
Lifts up its naked brow into the sunny sky;
Many a stone-tower
Looks with a father's eye
Watchfully down on the huts by the riverside.

RUTBERT.

Your pardon, my good friend, how name they that fair stream.

ADELHARD.

We northern knights in our tongue harshly call it Etsch
But the Italian maid's soft lip shapes sweeter sounds.
Now prithee, do not any further thus break in
Upon my song. It wafts me to a muchloved spot:
And I ne'er brooked to have my deeds or words cut short off.

RUTBERT.

Friend, be not angry. Questions surely do no harm.
It was my pleasure in thy song that made me ask.
But sing away, and boldly: I'll not do't again.

ADELHARD.

And my steed bare me
Up to the oldest
Mossiest castle along the steep linden-path:
Dark was the evening air,
Dusky the linden shade:
Here, thought I, spirits dwell pent in these dreary walls.
Athwart the grey darkness
There met me a ghostlike man,
At the steepest most slippery turn of the rocky path,
And brushed along past me;
Almost did my roan steed
Blinded with terror start down the dizzying height:
But forcibly reining him
Forward I drove him
Up to the storm-beaten cloud-like tower's giant gate.
High from the casements
Lights peered through the ragged cloud;
Hollowly sounded my knock from the vaulted door.
But Rutbert, there's a question in thy roving eye.
Is it not so? Then ask it freely, my good friend.

RUTBERT.

'Twas not a question, friend, exactly. I but thought,
If all the ghostly horrors caged within that tower,
With single torches dimly flaring o'er black walls,
If such the terrors that fill thy song, my Adelhard,—
I know not—but the ostriches are hopping round,
Rolling their balls of ghastly white amid the dusk,
And stretching forth their serpent necks from clouds of sand;
Nightbirds are screaming, and the lion's furious roar
Comes hoarsely through his throat that gapes with drought
of blood,—

So that I scarcely know if this be fitting time
To tell the horrors of that tower. But 'tis begun;
So sing away what fearful sights within those walls
That night appalled thine eyes: for fearful sure they were.

ADELHARD.

Dark stone winding stairs,
Echoing chambers,—
Thus onward I went—before me a lamp-bearing page,
A page that spake not,—
Up steps, down steps;
Till we stopped at a door from within which looked out
a light:

The light peeped through the crevices
So stilly, so secretly:—
Back went the door,—O round green garden-like room!
O lady so smiling,
Bright locks floating round thee!
O thou at her bosom, thou laughing, thou blossom-like
child!

And forward to meet me
With noble kind greeting
The castlelord stepped looking friendly and full in my eyes.
Then at the round table
In the guest's seat he placed me:
Bright through the wellcut glass sparkled the blood-red
wine.

Far off the spectres
Prowled through the midnight air;
Here round three blest ones was stillness and gladness
and light:
homelike, so daylike

Was the friendly bright chamber,
No spirit of fear could ever dare enter therein;
Unless a song ushered it,
Or tales that creep shiveringly:
Then many an awful legend of Norway I sang.
Whereto the castle lord
With hand of might touched the harp;
For God had endowed him with lordly sway o'er the
strings.

Of too he buckles on
His helmet of gleaming gold,
And seizes his spear, and into the forest goes forth;
There mid a hunter's feats
Recollecting the combats
Which in the land of the Franks he lately had fought.
Then homeward returning,
By his gentle wife greeted,
And greeting the heaven that smiles in the light of her
eyes,

With his babe playing,
As with an angel child,
Tell me, doth he not live in a Paradise here below?

RUTBERT.

Ay, that he does; and tears of joy into my eyes
Have almost mounted at thy picture of bright bliss.
But how shall this console us dwellers in the waste?
It rather breeds a painful gnawing at the heart,
To hear of joy, from which our lives are thus shut out.

ADELHARD.

Oh Rutbert, thou art far far better than thy words.
When we are cutting through this ocean's dusty waves,
Weary, and parched with thirst, and almost choked with
sand,
Is it no joy, no comfort then, to know that here,
Though far away, amid the desert islands bloom
Thus bright with fruit, where nature's breasts so richly
swell.

RUTBERT.

Yes doubtless: the remembrance has rejoiced me oft.

ADELHARD.

And shall not I rejoice then, that a mate in arms
And mate in song, amid this earthly wilderness,
On such a rich oasis dwells, so fraught with joys?
Shall I not therefore ply my task with stouter heart,
And stouter more victorious arm, if God so wills?

RUTBERT.

Thy words refresh me, like the sight of Norway's snows.

ADELHARD.

And look at that fierce imp there, reeling through the dark
On a bewitched pale ostrich, mocking us. Come charge!

RUTBERT.

Charge! I ne'er grasped my lance with more triumphant
glee.

UDE ON LITERATURE.

(Concluded from p. 425.)

M. UDE begins the practical part of his work
with the following observations:

'Words are the foundation of literature.

'Any fragments of dictionary will serve for the first
vocabulary, provided the old expressions and obscurities
be carefully removed. The words will not otherwise suit
the taste of society. If they be properly prepared, they
will serve for every subject.

'When there is a good book-manufactory, words
should be always at hand; as the language must be set-
tled according to the work intended to be published.

'Many writers complain, and with reason, of the heavy
trouble of writing, but do not consider the immense num-
ber of words in a dictionary, particularly before it is
trimmed. The difficulty will be much diminished by at-
tending to the preceding direction.'—P. 1.

We will add some of the particular receipts, so as
to furnish our readers with a complete conception of
M. Ude's manner:

'13. *L'Essai de Santé, or Wholesome Essay.*—Put
into a thin octavo or pamphlet six truisms, half a smile,
and a quotation from Dr. Johnson. Moisten with milk
and water (No. 5); or if it be designed for gentlemen, as
they have stronger nerves, weak tea (No. 7) may be sub-
stituted. Let it mix so that the moral may appear only
by degrees; skim off all the difficulties, so that it may

be quite clear and simple. When skimmed, throw into
it two authorities, two examples, a metaphor, two lines of
Shakespeare stuck with three of Tate, and three maxims
for conduct. Let the whole be gently diluted till it fills
two hundred pages. Add a little pleasantry, either à la
Joe Miller (No. 90), or à la Westminster-Review (No.
21.) Having strained it through tabinet till it is free
from all allusions to Greta Green or scandal; serve in
a drab cover, and hot-pressed.'—P. 7.

'75. *Roman à la Mode. Fashionable Novel.*—You
must invent a coxcomb, some good livers, and several
accomplished young ladies. The coxcomb is to be pre-
pared in the following manner:—Send him to school,
where he must be the idlest and most learned, the most
ill-tempered and most popular of the boys; let him be
expelled for insulting the master, who must shed tears at
his departure. Dress him with sauce à la financière
(financier's sauce), and put him into a college; there let
him spend all his nights in gambling, and all his days in
riding, and become, by the judicious employment of the
rest of his time, the most profound Greek scholar and ma-
thematician of all his contemporaries. Give him a degree
à la noblesse (nobleman's way, No. 56), and let him come
rapidly into the world; fling in at hazard half a dozen
eminent names; enrich his character with two or three
adulteries; season to your taste with gunpowder and fine
feelings. Boil the whole quickly together, taking care to
preserve the froth; and serve it in three volumes, labelled
in black, with the name of a fashionable publisher (No.
17.)

'181. *Treatise of Metaphysics.*—French Eighteenth
Century way.—Take as many pounds as you can obtain
of abstract terms, the heavier and darker the better;
carefully remove any remains of natural thought or feel-
ing that may stick to them, (keep these till you are making
a poem, à la Wordsworth, or Wordsworth way, No. 213);
grind the abstract terms together in a mill fit for nothing
else, till no difference of shape or colour can be perceived
among them. Add reasoning à l'avocat (lawyer's way),
and go on till your bookseller tells you to stop. Make
your conclusions as opposite as possible to the moral con-
victions of the world. Serve with a sauce libérale (liberal
sauce, No. 1.)

'205. *Poème à la Turque. Poem Turkish way.*—
First catch a brain fever, and next catch a hero; mix
them together; garnish with golden skies, blue waters,
orange-trees, yataghans, (No. 23), sentiment, murder,
and muselman crim. con.; bind with red morocco, and
serve as a collation in boudoirs.'

THE PROMENADES OF PARIS.

THE French are the first promenading people in
the world: they have their promenades à pied, en
voiture, à cheval; their promenades sur l'eau;
and now and then even their promenades dans l'air.
Does a provincial town pretend to civilization? it
justifies its claim by pointing to its Place de prome-
nade. Does a column of the Grande Armée, after
'covering itself with glory,' take possession of a
foreign town, thrusting French *employés* and French
usages down the throats of the subjugated? the first
care of the conquerors, their first step towards the
improvement of the new subjects, is to pull down
their houses or fill up their canals, in order to furnish
them a promenade. The idea of civilization in the
French *baïlaud*, seems scarcely in fact to extend be-
yond the existence of a public walk. No wonder,
then, that accommodations of the kind abound in
Paris, the nucleus of modern civilization; and that,
during the fine evenings of summer, the gardens of
the capital are thronged by shoals of bipeds—men,
women, children; plebeians, nobles, dignitaries of
church and state; the rich and the poor, young and
old, shabby and elegant,—people in short of every
class, of every description of character and physio-
nomy, of all complexions, and of all countries;
forming most picturesque assemblages, rich in
strong and most amusing contrasts.

Every quarter of the great city, in fact, seems to
possess its peculiar place of assembly—its rendez-
vous of daily loungers. Here we have the long
and magnificent avenues of the Boulevards encir-

cling with a girdle of green the heart of the capital; there among the deep shades of the Thuilleries, the wonders of art, and the perfume of pomegranate and orange blossoms, unite to charm at once the intellect and the senses. Quit the Royal Gardens, and the cheerful alleys of the Champs Élysées, terminated by the imposing masses of architecture of the Barrière de l'Etoile present themselves: the quiet inhabitant of the Marais seeks the cool air of evening in the healthy opening of the Place Royale: the Jardin des Plantes receives under the shade of its cedars of Lebanon and other evergreens, the population of those unknown regions towards the latitude of the Pont d'Austerlitz, the antipodes to the inhabitants of the Chaussée D'Antin. In the Luxembourg, that delicious Oasis for the sons of Themis and Esculapius, the student, charmed by the odour of the acacias, instead of poring over class-books and institutes, scribbles his *cinq codes*, with madrigals in honour of the beauties of the *Pays latin*.

Agitation—the move—the promenade—are the second nature of the Parisian, the elements in which he lives. The constant exercise of all his senses is, with him, an absolute necessity: to see and to be seen, to hear and to relate, to be ever abroad, and to live as it were, in others, is indispensable; hence, this assiduous frequenting of the public gardens, and of places of general assembly. Civilization, commerce, knowledge, are the gainers by this incessant contact of man with man, by this perpetual friction of individual against individual. To its influence may be attributed the sudden formation of public opinion, which spreads with electrical rapidity from the first to the last link in the social chain, and which, by an instinctive impulse of sympathy or antipathy, responds to every phenomenon of moral, literary, or social order. And how busy, how active, this apparent idleness—this seeming diversion! The votary of commerce, (like the London stock-broker or attorney at Epsom on the day of the Derby), never loses sight of his main object—his sugar and his spices still are with him. He makes an exchange of the promenade. Among a group of loungers, he strikes bargains for his colonial produce, and his cargoes of log wood. Here, too, the agent of Sidy Mahmoud recruits Circassians destined to embellish the harem of his master. While criticising in the gallery of the Louvre the painting of the *Sacre*, your banker also will negotiate with a plenipotentiary some great national loan which shall add another million to the many which already fill his coffers, and attach to his button hole the only riband wanting to complete his collection of European orders. Odry, seated near a group of commercial-travellers, overhears their jests, and picks up the bon-mots and calembourgs which he retails in the evening on the boards of the 'Variétés.' The opposition député, lounging through the Jardin des Plantes, seizes the bold metaphor, with which, in his eloquent extempore, he enchants the Chamber, from the elegant neck of the giraffe*; and the poet of the romantic school, reciting his dithyrambic under the jet-d'eau of the Thuilleries, would arouse the voice of the swans by the sweet melody of his verse. Not such places, however, it must be owned, has the divine Astræa chosen for her retreat: wo to the countryman whose exterior shall happen to bespeak ingenuousness and simplicity! Figures of this description are real prizes at Paris. The new comer is already in the hands of some hospitable host, whose smile is most winning and gracious—whose manners are most captivating: who is proud to introduce the stranger to the first society; anxious to make him acquainted with all the curiosities of the great metropolis; to procure him a sight of the stud of the Duc de Bordeaux; to make him familiar with the moustaches of the first grenadier of France, with the cocked hat

and green frock of the *petit tondu*. Our stranger accepts the attentions of his influential friend: he is charmed with the gossip, the wit, the cordiality of his cicerone; and on arriving at his lodgings, full of calculations of the advantages to be derived on the morrow from his courtly acquaintance, he finds his pockets empty.

Nothing true, nothing real, in the exterior of these puppets that pass and repass before you! They are gilded pocket-pieces which have nothing but the appearance of glitter—a masked assembly—a constant carnival.

Who can that elegant figure be with the silky cashmere—her features gently shaded by a curtain of fine blonde, surmounted by a weeping plume, and whose attire is altogether so attractive, so picturesque? 'It is the young Countess of —, the Ninon of the Faubourg St. Germain,' says aloud, an exquisite as he passes. 'No such thing,' says a second, in a lower tone, 'she is the chère amie of a money-changer—the Dubarry of the Quartier d'Antin.' 'You are both wrong,' says a third, better informed than his companions, 'she is purely and simply Francisca, the mantua-maker of the Galerie Vivienne: I was with her this very morning giving orders for the wedding dresses of an heiress who is about to be my bride, and whose *rentes* will help me out of the clutches of the rascally duns who are incessantly tormenting me for my college debts: this imposing Aspasia is a mere show figure of the fashions—a sort of walking shop-window.

Under the shade of the wide-leaved sycamore behold a young lady, her long dark lashes shading her brilliant eyes so modestly cast on the ground: in her person the voluptuous form of the mistress of Titian, is ennobled by a face full of the graceful purity of a holy virgin of Raphael: a slight expression of melancholy shadows her countenance and heightens its expression; her bosom seems to heave oppressed by some soft pain, and now and then to find relief in a gentle sigh. An elderly person of her own sex, is her sole companion, and watches, with anxious solicitude, the slightest movement of her interesting charge. Surely, this must be the amiable widow of one of the slain heroes of Trocadero; or, perhaps, the bride of some officer of rank, whom orders to embark for the Morea had torn from his home and the arms of his beloved, at the moment when the sacred rites of the church had hallowed their felicity.

Not far from this charming picture of abstraction, behold, seated at his ease, one arm thrown with graceful negligence over the back of his chair, a young captain of lancers, who seems to have Poniatowsky for his model, as gallant in his bearing, as well made as the noble Pole, as fascinating in his air and attitudes: he sits silent, absorbed, and timid in the presence of so much delicacy and beauty. Yet a natural look of complaisance on the countenance of his neighbour gives him courage; the fall of a withered bough furnishes the smitten lancer with an excuse for addressing a few words to the pensive recluse: moroseness and beauty never were allied—the politeness of the cavalier is acknowledged with due reserve. Emboldened by the condescension, our soldier pushes his advances, and a conversation ensues. In the evening, behold our handsome couple witnessing, from a private box, the representation of Marino Faliero—acquaintances, you would think, from infancy,—having cemented their new alliance with *perdreau aux truffes* and champagne in a cabinet particulier of the sumptuous restaurant of the Rue Rivoli.

But wherefore this sudden rush?—The crowd increases—the press thickens. Has the whale of the Place Louis XVI, escaped from its enclosure to sport in the waters of the basin of the Thuilleries? No: but the Chinese of M. Martignac, as interesting at least as the Osages of M. Villèle, are in the gardens. The demon of curiosity has led them to join the throng: but alas! scarcely are they mixed with the promenaders, when an effective blockade ensues. Prisoners in the middle

of the walk, Kion, Ly, Lic, and Tchün, are the general butt; they sit as it were for their caricatures, until the keeper of the gardens, armed with his silver headed cane, breaks through the crowd, delivers the unfortunate captives, and conducts them with due politeness to the gates. The throng disperses: and then it is that more than one of the curious ascertains that his watchguard has been broken, and his brequet abstracted; but he may console himself, for he has seen the Chinese.

In the midst of a variety of episodes and burlesque scenes, the twilight passes, night throws her shades of ebony over the garden of the Thuilleries, the brilliant lights of the chandeliers begin to shine through the windows of the Palace of Kings, the rattling drums of the *Cent Suisses* give the congé to the promenaders, the empty chairs are built in pyramidal piles, the groups separate, the crowd disperses, and silence and solitude succeed to the scene, lately so full of life and animation.

THE BULLETIN UNIVERSEL.

THE object of the French monthly publication, now generally known throughout Europe under the title of the 'Bulletin Universel,' is to establish a centre of regular communication between the learned and the ingenious throughout the world—to form a chain of correspondence in fact between all those who are engaged in contributing, in any way or degree, to the progress of human knowledge, to whatever country they may belong, however distant may be the theatre of their respective labours, and in whatever language the result of those labours may be originally published. With this view, arrangements are made for procuring regular information on all matters of interest connected with the sciences and arts from the parts of the globe most widely asunder: the journals and periodical collections of every kind, the transactions of academies, public institutions, and learned societies in either hemisphere, as well as new publications, are brought together; and from these whatever is remarkable or novel in science or art is extracted, analysed, or noticed every month, under eight divisions or heads, to every one of which a part or section, forming indeed a separate journal (to be purchased apart) is allotted. These divisions comprise the following subjects: 1. Mathematics, Physics, and Chemistry; 2. Natural Philosophy, History, and Geology; 3. Medicine and Surgery; 4. Agriculture and Rural and Domestic Economy; 5. the Mechanical and Useful Arts, &c.; 6. Geography, Statistics, Travels, &c.; 7. History, Antiquities, Language, and Literature; 8. Military and Naval Economy.

The advantages of a work which should constitute an authentic report, every month, of the latest intelligence from the different quarters of the globe, of transactions relating to the important subjects which give the titles to the different sections we have just enumerated, are too obvious to require to be enlarged on; the utility of the object in view is self evident, and that alone will deserve for the enterprise universal approbation and support.

The following are a few details, gathered from the papers on our table relating to this undertaking, of the history of its formation, the mode in which it is conducted, the change which has been lately effected in its management, with a view to procure it a better chance of permanent existence, and the purpose with which the founder has visited this country.

The 'Bulletin Universel' was commenced in the year 1824, as a private speculation, by its present director, the Baron de Ferussac, associated with the two bookselling establishments of Dufour and D'Ocagne and Treutzel and Wurtz, and was carried on by these parties until the spring of the last year, under the general superintendence of the director.

The different sources whence the information to be collected in the 'Bulletin' is to be derived, are submitted to competent individuals, who make the necessary analyses and abstracts or extracts; but the

* We beg our admiring correspondent, who entertains such serious apprehensions for the reputation of 'The Athenæum,' on account of the *stupid* mistranslations in the article on the death of the Austrian Giraffe, to republish that paper.

care of editing every division of the work is more particularly entrusted to persons versed in the branch of science or learning to which the respective section or journal relates, and the names of these persons are affixed to the particular number published under their supervision.

Reasons, of which the ostensible one was the desire to render this undertaking more durable than it could be expected to prove if it remained the mere speculation of private individuals, induced the Baron de Ferussac to take the necessary measures for placing it under the protection of a public association. A society, authorised by a royal decree, and of which the Duke d'Angoulême became the patron, was formed accordingly in the month of March, 1828, with a proposed capital of 450,000 francs, to be produced by the sale of 450 actions or shares, of 1000 francs each. The most distinguished scientific men of France, we are assured, have become members of the society; and the object of the visit of the Baron de Ferussac to this country is to recruit for associates in the undertaking among the learned and ingenious on this side of the channel, as well as among those who may be willing to contribute in a pecuniary way to the success and permanence of the establishment by simply becoming shareholders. Similar steps are taking in Germany and other parts of the Continent, and in the Americas, to extend the number of persons directly interested in the undertaking.

For ourselves, we are ready to avow our cordial good wishes for the success of the project of the Baron de Ferussac. We have had occasion for some time past to observe the advantageous nature of the work of which he is the founder; we perceive in it a publication required by the sciences and arts. We are persuaded that Paris, on account of its central situation, and of its easy accessibility from the different extremities of the civilised world, is the fittest capital for carrying on such a project, if, indeed, it be not the only place at which it could be efficaciously conducted; and no one will deny that the facility and wide diffusion of the French language render that tongue the best possible medium for the desired communication. That the work is capable of improvement we are well aware: we cannot doubt that the correspondence might have been more speedy, direct, and regular, than it has hitherto, if due pains had been taken; or, perhaps, it would be more just to say, if the inadequacy of means had not necessitated too great a reliance on fortuitous as well as gratuitous sources of supply. It is clear that, to render an undertaking of this kind complete, or an object of interest and desire to the well-informed, it must be independent of generosity and chance; that the most active exertions should be used to procure a regular supply of latest intelligence on all matters, from every quarter; and that the information so obtained should be recorded with every possible speed and diligence. We doubt not that, as the difficulties which attend the commencement of a work of such magnitude shall be surmounted, the imperfections hitherto observable in it will be remedied; and that, in a very short time, if the undertaking meets with the support which it certainly merits, the manner in which it is executed will be as complete as the plan of the publication itself is admirable.

The Baron de Ferussac, we understand, on his arrival in London, submitted his plans to the consideration of the Society for the Diffusion of Useful Knowledge, and requested the aid of that association. The proposition was referred to a committee, consisting of Mr. Brougham, Mr. Hill, and Mr. Goldsmidt, who, in their report express much approbation of the plan of the work, and recommend it to the notice of individuals. The report, in adding that it was not consistent with the object of their own institution to form any alliance with the association of the 'Bulletin Universel,' recommend that one share should be taken by the society.

* Greater care as to the exactness of figures should be insisted on from the editors of the various sections. Inaccuracy, in this respect, is but too general in French periodicals.

M. CHAMPOLLION, JUN. THE NUBIAN EXPEDITION.

We perceive, with regret, that M. Champollion, with the real and sound claims he unquestionably possesses to the respect of the learned of all countries, cannot divest himself of a species of charlatanerie but too common among his countrymen. His letters would have been sufficiently interesting had he confined them to the discoveries which his interpretations of hieroglyphics have enabled him to make in the history, or rather the chronology of the Egyptians, but the importance with which he blazons forth his observations of monuments which have been often seen before, and even recently described by his own countrymen*, bespeak an egotism quite unbecoming the expounder of the hieroglyphics. An evident exaggeration too, and an affected enthusiasm perceivable in his descriptions, give grounds for receiving his accounts with no inconsiderable measure of qualification. He commenced his tour in Egypt with a *grand discovery*, which, had he carried with him the remembrance of Denon's work, to say nothing of the many drawings of less notoriety in this country, he would have known was no discovery at all. In his accounts of the bas-reliefs at Ibsamboul, he talks of the *perfect* drawing (!) of the figures: comparing it to that of the best Greek vases. This is absolute nonsense. That the drawing is good, that is to say, good for Egyptian sculpture, will not be denied; but to give the epithet perfect to drawings in which the limbs, arms, and hands are stiff, unformed members, with little or no drawing at all, is quite preposterous. Where M. Champollion has derived his notions of the figures on the best Greek vases, we profess ourselves curious to learn.

The conduct of M. Champollion, with regard to the stone discovered by our countryman, Mr. Burton—but we trust the story is not true,—and the manner in which he betrayed the confidence reposed in him by one who was induced to let him into the secret he had withheld from others, in deference to his high reputation, is particularly unfortunate in his particular situation; since a considerable portion of the merit claimed by M. Champollion, (unless our memory deceives us greatly), for his discovery of the interpretation of the hieroglyphics, depends on his own assertion, that, at a certain particular period, he was unacquainted with the labours of Dr. Young, which had preceded his own. Surely a person so situated should have been more than usually cautious of affording reason for doubting whether the principle by which he is generally actuated is of a lofty character. After all, one of the most useful discoveries of M. Champollion is, it seems, that of a cure for the gout, by means of a stove-bath, such as he enjoyed in the interior of the temple at Ibsamboul.

THE COLOSSEUM.

THE new system of admission adopted at the Colosseum, and which makes it optional with visitors either to content themselves with the view of the Panorama, paying two shillings, or to go through the list of curiosities of this extraordinary place, on the payment of additional entrance-money, seems likely to increase greatly the popularity of the exhibition. The change has induced us to repeat our visit to it, and we are happy to find that, amidst all the difficulties by which, according to rumour, the speculators in this concern have been embarrassed, a considerable advance towards completion is observable.

The circular gallery for promenading is completed, and forms a convenient, if not an elegant, resting place. The niches are fitted-up with sofas, and attendants are at hand with ices and confectionary for those who desire such refreshments. The centre of the gallery is adorned by busts, the works of living artists; and at one extremity is a

Crucifixion in relief, by M. Sievier. We do not feel called on to pass criticisms on these productions.

Progress has also been made in the painting of the Panorama, but this part of the work is still imperfect; yet are we safe in pronouncing that the situation, from which it is to be viewed to most advantage, is the first or lower of the two galleries. In the upper one, the spectator is placed above the line of the horizon; the effect of this is unnatural, and by no means happy. It would be better, indeed, if the view from the second gallery were altogether excluded. The same observations are applicable to the peep-holes in a region still higher. Such varieties may be attractions for the vulgar, but they injure the effect of the Panorama and the impression it leaves on the mind. As to the painting itself, it will bear very minute inspection: it excites even greater astonishment, when closely examined by means of the numerous telescopes with which the public are accommodated, than when viewed generally without artificial aid. Contemplated in this way, a regret will perhaps occur, that a portion of the nicety in the details had not been sacrificed to a more powerful general effect, and greater force of colour. The drawing throughout is admirable. The exercise of a little ingenuity we should imagine, might obviate the apparent imperfection which arises from the slanting part of the Panorama which is not painted—we mean the part which represents the roof of the aisle.

The Conservatory and Swiss Cottage are splendid and highly interesting. Among the many rare plants in the former, there is not one perhaps which unites more claims to curiosity and attention than the Papyrus—the Egyptian plant from which the paper of the ancients was manufactured. The little Swiss cottage it was impossible to enjoy, without reflecting what an admirable retreat it would have formed for the unfortunate Mademoiselle Verrey. Here she might have dispensed her bonbons, and enjoyed the homage of admiring beaux, unannoyed by the persecutions of a barbarous populace: she might have flourished a goddess worthy of such a shrine. The temple, however, is not yet consecrated: and we feel too confident in the piety of its founders, to suppose that they will allow so worthy a sanctuary to remain dedicated to a mere imaginary divinity.

We cannot quit the Colosseum without calling attention to the imposing architecture of the portico, and more especially to the tinting or stains by which it is sought, and with remarkable success, to give to the stucco the massive and weather-exposed effect of hard material and of antiquity.

FINE ARTS.

ENGRAVINGS.

Sunday Morning. The Toilet. Engraved by Romney, from a Painting by R. Farrier, in the possession of Edmund Woods, Esq. Ackerman, and Moon, Boys, and Graves.

THE original is one of the expressive and cleverly drawn productions of Mr. Farrier's pencil. The figure and face of the rustic coquette are perfect, and excuse, as quite natural, her 'lingering to take a last, last look,' (in the glass). Nor is Granny's pride unpardonable, however imprudent the encouragement she gives to the satisfaction of the self-enamoured maiden. The engraving might be a little less coarse.

Picturesque Views on the River Clyde; engraved by Joseph Swan, from drawings by J. Fleming, with historical and descriptive Illustrations by J. M. Leighton. Part IX. Griffin, Glasgow; Moon, Boys and Grave, London.

THE views contained in this Part are Gloch Lighthouse, Dunoon and Castle from the south west, and Kelly House, the seat of Robert Wallace, Esq. The first is a delightful and picturesque scene, and a bright, clear, and effective plate; the second also is a pretty view, but the engraving is

* See Gau's work.

somewhat muddy. Mr. Swan, we presume, has not the entrée of Kelly House; he is certainly less at home there than at the Lighthouse.

The Rustic Wreath. Engraved by G. H. Phillips, from a Painting by W. F. Witherington, in the possession of G. Morant, Esq. Moon, Boys, and Graves.

THIS is a charming plate—a mezzotinto, full of artist-like effect, and of most sweet and delightful expression; creditable to painter and engraver.

View at Brighton—Copley Fielding, engraved by Charles G. Lewis. Moon, Boys, and Graves.

THE engraver, no doubt, finds his best exertions necessary to do justice to the clever and spirited drawings of Mr. Copley Fielding. We cannot consider this attempt by Mr. Lewis as a successful one. It has a harshness almost repelling.

NEW MUSIC.

'O! fair glides the bonny Birk,' as sung by Miss Paton, arranged from an ancient Border Song, by T. Welsh, the words by Melrose. Welsh.

MANY of the old Scotch reels generally played (for dancing) as 'fast and furious' as possible, have been found to be highly interesting, when performed quite slowly—for example, 'Roy's wife of Aldivaloch,' 'Green grow the rushes O!' &c.—The Air adapted by Mr. Welsh, presents another example, and a very pleasing one it is; with Miss Paton's singing it must be highly interesting, being extremely well adapted to her voice and manner, and a worthy companion to her admired 'Mary of Castle Cary.' Mr. Melrose's words are by no means well adapted, the metre being much too short for the music, and thus parts of every line are necessarily repeated, and the sentiment intended to be conveyed, quite destroyed. For example—

'My swelling heart, is bursting, is bursting,
'The bitter tear, of sorrow flow'd, of sorrow flow'd,
'sorrow flow'd.'

however, the song is very pleasing, and deservedly popular.

The Albion Waltz, for the Piano Forte, arranged, and fingered by J. B. Cramer. Cramer and Co.

A PRETTY, useful, and light bagatelle, expressly well adapted for incipient performers, and teachers in schools.

'Slumber lie soft.' Canzonet, the Poetry written by J. R. Henry. The Music composed by John Barnett. Gow and Co.

AN Andantino Cantabile con Espressione (in C, 3-4 time), of a flowing and soothing character, agreeing quite well with the language, very easy to be performed, and with a moderate compass of voice. The first bars remind one of 'Le Gentil Houard,' but the resemblance is accidental. The accompaniment from the beginning to the end being (without a single exception) divided into triplets, creates a little monotony, but it is cleverly arranged, and the 'tout ensemble' is very pleasing and characteristic.

The favourite Airs from Auber's much admired Opera and Ballet, 'Masaniello, or La Muette de Portici,' including the Guaracha, Bolero, Tarantula, Barcarollo, and a Recapitulation of all the Melodies, arranged for the Flute by L. Drouët. Cocks and Co.

WHEN a musical performer and writer of high eminence, adapts and publishes popular music for his instrument, he generally renders it so difficult of execution (not being himself aware of what is difficult to learners) that his arrangement cannot be made generally useful for circulation amongst the multitude. This is not the case in the work we now notice, and therefore is it unusually desirable. This adaptation of the highly popular music of 'Masa-

niello,' is presented in a form the most pure, simple, and pleasing; and although any other flautist might have made a similar work, yet Drouët's 'name is a tower of strength,' and of course gives a consequence to it that must form a striking recommendation. He has adapted twelve of the airs (nearly the whole of the Opera), and subjoins as a 13th piece, a sort of easy fantasia, or pot pourri, recapitulating all the melodies in a trite and familiar style, and in good taste.

The work is neatly brought out, and at the exceedingly cheap price of 3s.

VARIETIES.

PRIZE FOR COLOURED LITHOGRAPHIC PLATES.

The French *Société d'Encouragement* has proposed that two thousand francs be given to the inventor of a certain and economical method for colored printing in lithography. The conditions required are, that the method shall be reduced to practice by the inventor in such a manner, 1stly, as to furnish at least a thousand impressions of one subject, either complete, or so far advanced (in case the work shall demand a fine finish), that the colouring of the plates may be effected at a slight expense; 2ndly, that the results shall be less expensive, without being less perfect, than those which are furnished by the printing in colour on copper. The society do not exact, that the operation shall be confined to the use of a single stone; but they require an exact description of the process, an estimate of the expense, as well as specimens of different plates. The prize will be determined in the course of the second half-year of 1830. The memoirs and proofs to be sent in before the 1st of May of the same year.

HUNGARIAN MUSICAL PRODIGY.—One of the youthful prodigies of the age is the Hungarian, Baron Von Praun, a count palatine and knight of several orders. From his infancy he gave indications of precocious abilities by extraordinary progress in mathematics, languages, and other sciences, but above all, by his talent for music. In his practice of this art he devoted himself exclusively to the violin; and before he was twelve years old had attained such proficiency that he commenced a tour through Italy, Sicily, and France, and gave concerts in the principal towns in which he had occasion to sojourn, equally surprising and delighting all who heard him. We happened to be at Palermo in the year 1823, when he visited that capital, and were frequently present at his private and public performances. He was a lively pleasing boy, and by his manners won the favour of all who conversed with him, as much as he excited the astonishment of the public by his great taste and wonderful execution.

It is not without interest, therefore, that we read of the arrival of this youth, now in his eighteenth year, in Berlin, for the first time, at a season when the almost miraculous performances of Paganini were the exclusive topic of conversation and applause in every circle. The fame of the Hungarian had already preceded him, but the public were hardly prepared to find so young a man enter the list with so formidable a rival. The friends of Von Praun, however, gave out that the Italian violinist was about to be eclipsed, and the rumour was spread that the youth considered his playing equal to Paganini's. The prices of admission to his concert were consequently raised; but this measure had an unhappy effect; the public, it seems, mistrusted the voice of fame on this occasion, and the theatre was almost empty. 'By the pretensions,' says a German critic, 'of the young artist and his friends, he had himself placed the scales in which he desired to be weighed in the hands of the public, and he was judged accordingly.' He performed a violin concert of Mayseder's, arranged for the violin by La-fonte, and a rondo "Alla Polacca," of Benesch. The verdict of the scanty audience, it seems, was not calculated to answer the high expectation of the musician or his friends. It is allowed that his

tones are full and soft, and that his performance called to mind that of the celebrated Rhode; that the length and precision of his bowing were admirable, and that his fingering was dexterous; that the youthful performer possesses abilities and power seldom, if ever, displayed by so young an artist; but it is observed, that although he performs foreign composition, if not with the freedom of a master in his art, certainly with great facility, yet was he ill-advised to subject himself to so unnecessary an ordeal as a competition with Paganini, and to run the risk of raising, by his undue presumption, a prejudice in the mind of the public, which it would be difficult afterwards to overcome. The Baron Von Praun subsequently performed at a lower price of admission, and in another theatre, and repeating his defiance of his rival, played a concerto of Lafont with a capriccio of Paganini's added to it.

COAL MINES IN SPAIN.—The Company of the Guadalquivir having endeavoured to ascertain that the coal mines of the Asturias could supply them with twenty thousand tons per annum, the intend-ant of that principality replied, that it would not only contract to furnish them with the required quantity at the rate of 14s. per ton, inclusive of the expense of shipment, but that the stores of this article which nature had provided, were so considerable and the facility of extracting it so great, that the Asturias were capable of providing coals for the entire consumption of Europe during an unlimited term of years. He adds, that the whole soil is one immense mass of carbonaceous matter.

CHANNELS OF TRADE—ENGLAND AND FRANCE.—England possesses 30,000 miles of roads, nearly 4000 miles of canals, and above 300 miles of railways; whereas the territory of France, which is more than twice as extensive, does not afford above 45,000 miles of roads, 1500 miles of canals, and 114 miles of railways, of which latter, seventy-eight are still in course of completion.

THE LONDON UNIVERSITY.

ON occasion of the recent distribution of prizes at the London University, some of the papers have thought fit to remark that the Institution is useless because the persons whose names appear in the list of successful candidates are not inhabitants of London. It is not quite honest in the champions of religion and morality to assume that the ultimate result of such an experiment as the London University can be inferred from a trial of a single year. For our parts we confess we have been much surprised at the success being already so great; and are delighted to see that the country is so sensible of the general want of good education. We have no doubt that before five years are past the residents in London will very generally avail themselves of the new establishment for the instruction of their sons. But at all events, there can be no question that if not a single metropolitan student were to enter the walls there is abundant room for the exertions of the professors among youths from other places. We trust the University may go on and flourish; and that King's College may soon be enabled to add its exertions to those of the earlier Institution. We add an account of the ceremony which has given rise to such injudicious comments.

The first session of the London University having terminated, the presentation of the prizes took place on Thursday last, the 9th of July. Earl Grey presided, and distributed the rewards, which consisted of handsomely bound copies of various ancient and modern classics.

The prizes had been awarded according to the merits of answers, in writing, to a series of questions printed for the classes of each professor, and delivered to the student after he came into the examination room. Two prizes were given in each class, and certificates of honours to all whose answers attested a certain degree of excellence beyond mediocrity or respectability. The classes, the students of which had submitted to examination, were Latin, Greek, English, Mathematics, Natural Philosophy, and English.

LATIN CLASS.—Thomas H. Key, M.A., Professor. The number of pupils entered for this class was 102, divided into three other classes according to their proficiency.

The First or Lowest Class contained twenty-five students. Their studies had been five books of Caesar's Gallic War, and the first and one-half of the second book of the Civil War. Twenty had submitted to examination, and six had received certificates of honours.

Second Class.—Number of students, 81. Studies.—Two or three books of Caesar's Gallic War, the first book of the Civil War, the twenty-first book of Livy, and the ninth of the *Æneid* of Virgil. Examined, 20; hon. cert., 8.

First or Highest Class.—Number of students, 47. Studies.—One or two books of Caesar's Gallic War, the Life of Caesar by Suetonius, the twenty-first, twenty-second, part of the twenty-third book of Livy, and the Letters of Cicero, both miscellaneous and those to Atticus, between the years 685 and 686, of Rome. Examined, 33; hon. cert. 19.

Students of the Latin Class who received Prizes:—First Class—J. R. Bunnett, C. H. Barton. Second Class—Wm. Johnson, the Earl of Leicester. Third or Highest Class—J. C. Means, C. Dunkin.

GREEK CLASS.—George Long, M.A., Professor.—Number of students, 79; three Classes.

First or Lowest Class.—Studies.—The first four books of Xenophon's *Anabasis*.

Second Class.—Three books of the *Anabasis*, and the *Prometheus* of *Æschylus*.

Third Class.—Part of Xenophon's *Anabasis*; the entire first book of Herodotus; parts of the second and third, relating to general geography; the *Prometheus* of *Æschylus*; and a part of the *Œdipus Coloneus* of *Sophocles*.

Prizes.—First Class—T. Fisher. Second Class—W. Johnson, Earl of Leicester. Third Class—J. C. Means, W. A. Salter, C. Dunkin.

ENGLISH CLASS.—Rev. T. Dale, M.A., Professor.—Number of students, 32; average attendance, 24. Examined, 16; cert. 13.

Prizes.—R. Saunders, Frederick Lucas. English Composition—Frederick Lucas.

MATHEMATICAL CLASS.—Augustus de Morgan, B.A., Professor.—Number of students, 100; Classes, 2.

First or Junior Class: two Divisions.—Studies of the lower division—First four books of Euclid, and Algebra as far as equations of the second degree.

Second Division.—Six books of Euclid, Algebra as far as the Theory of Equations of the second degree, the Binomial Theorem, the Theory and Practice of Logarithms, the Elements of the Theory, and Series of Plane Trigonometry.

Senior Class.—Conic Sections, Spherical Trigonometry, the Theory of Equations, the application of Analysis to Geometry, and the First Elements of the Differential Calculus, and the Calculus of Differences. A few had proceeded further into the latter subject.

The number of students in two divisions of the Junior Class, 65. Cert. 13; viz. 9 in the lower division, 4 in the upper. Of the Senior Class, 9 were examined; cert. 4.

Prizes.—First Class—A. McCulloch, W. Johnson. Second Class—W. G. Turner, J. C. Means, equal. Third Class—R. L. Powell, T. A. Mitchell.

NATURAL PHILOSOPHY.—No regular class formed, but lectures were delivered three times a week, adapted principally for students of a limited knowledge of elementary mathematics, and embracing the principal parts of mechanics, hydrostatics, and pneumatics. Additional lectures were delivered twice a week for the particular instruction of a few who were found to have made some attainments in mathematics. A very large class of students, from the age of fifteen to thirty, attended several of the lectures into which the business of the session was divided. As many as one hundred attended one of the courses on Mechanics.

Of the students who attended the particular lectures submitted to examination, two were rewarded with

Prizes.—R. L. Powell, Count Calhariz, (son of the Marquis Palmella), equal.

ENGLISH LAW.—Number of students, 144. The prizes were received by E. J. Johns and J. Whitesides.

TO CORRESPONDENTS.

THE contributions of several correspondents, some of which we return with regret, after having kept them long in the hope of finding a place for them in our columns, lie at the publishing office for the respective authors. The paper of B. and one or two others, it seems, must have been mislaid in the confusion consequent on changing the places of printing and publishing.

A. B. C. will find an answer, a satisfactory one we trust, in a note to the article entitled 'French Promenades.'

BOOKS PUBLISHED DURING THE WEEK.

Caledonian Horticultural Transactions, vol. 4, part 2, 8vo., 10s. 6d.
Devereux, by the author of 'Pelham,' 3 vols. post 8vo., 12. 11s. 6d.
Captain Frankland's Travels to and from Constantinople in 1827 and 1828, 2 vols. 8vo., 12. 11s. 6d.
Portraits of the Dead; to which are added, Miscellaneous Poems, post 8vo., 10s. 6d.
The Brunswick, a Poem, in three cantos, 5s. 6d.

Length of day on Sunday, 16 h. 12 m. Decreased 22 m.
No real night.
Sun's horary motion on Sunday, 2' 23" plus. Logarithmic num. of distance, .007942.

This day is published, 3 vols. post 8vo., price 12. 1s. bds., **EMILY MORELAND**; or, The Maid of the Valley. By the Author of 'Roseline Woodbridge.' Three hundred copies of this work are subscribed for previous to publication.
Sherwood and Co., 23, Paternoster-row.

TOUR TO THE LAKES.

Price 15s. boards.

A GUIDE TO THE LAKES OF CUMBERLAND, WESTMORLAND, and LANCASHIRE. By JOHN ROBINSON, D.D. Rector of Clifton, Westmorland.

Illustrated with 20 Views of Scenery, and a Travelling Map of the adjacent Country.

London: printed for Harding and Lepard, Pall Mall East.

NATIONAL PORTRAIT GALLERY. WITH MEMOIRS BY THE REV. HENRY STEBBING, M.A., &c.

PLAN OF PUBLICATION.

The series will embrace all those who are distinguished for their exalted rank, their professional celebrity, or their literary or scientific attainments; thus placing before the reader authentic Likenesses of the individuals who have done most to protect or enlighten their native country.

Every Number will contain three highly finished Portraits, with an Autograph, and Impartial Biographical Sketch, of the distinguished individual represented; and in order to suit the work to the several purposes of historical illustration, such attention will be paid to the Portraits, as will render them fit to accompany any present or future history of the Nineteenth Century.

Persons desirous of becoming Subscribers, are requested to forward their names early to their Booksellers.

No. I. contains, Arthur Wellesley, Duke of Wellington; George Gordon Byron, Lord Byron; John Jeffries Pratt, Marquis Camden.

No. II.—William Pitt Amherst, Earl Amherst; Her Royal Highness, the late Princess Charlotte; William Hyde Wollaston, M.D. F.R.S.

No. III.—William Wyndham Grenville, Lord Grenville; Elizabeth, Marchioness of Stafford; John Jervis, Earl St. Vincent.

'This is the beginning of a series, which, if followed up with due diligence, must be valuable to the Public. The present number contains three Portraits—the Duke of Wellington, Lord Byron, and the Marquis of Camden. Brief memoirs accompany them, written with the good sense and information that might be expected from their author.'—*Court Journal*.

CONFINEMENT OF THE BOWELS.

An irregular or costive habit of body undermines the best health, interrupts both comfort and enjoyments, creates numerous disorders, and seriously aggravates every other bodily affliction. The constant use of opening medicine is almost equally injurious, frequently producing diseases more serious than those which it was intended to remedy. All these evils may be obviated by "Read's Patent Self-Injecting Laxative Instruments," which, by means of a little warm water only, is found to open the bowels and preserve them in a regular and comfortable state. The great popularity and success of READ's Apparatus (which was introduced to public notice by Sir Aslety Cooper) having induced various persons to imitate his Instrument, through which the public are imposed on by articles that are soon useless from becoming imperfect and out of repair, the Patentee respectfully informs the public that his Apparatus is the only one patronized by the great body of the faculty, and approved by the Royal College of Surgeons and other Medical and Philosophical Institutions in Great Britain and on the Continent. Manufactured by J. READ, 35, Regent Circus, Piccadilly; and sold by his appointment by the following Surgical Instrument Makers in London: PEPYS, Poultry; EVANS, Old Change; STODART, Strand.

Letters and inquiries (free of expense) answered by post, accompanied with printed Explanations, illustrated by Diagrams (gratis), and Instruments sent to any part of the Kingdom, by application by letter, containing an order for payment; the money to be returned if the Apparatus be not approved.

IMPROVED TERRO-METALLIC TEETH.

MR. HOWARD, 52, Fleet-street, (removed from 33,) having brought to perfection an important improvement in TERRO-METALLIC TEETH, respectfully solicits the attention of the Nobility and Gentry to his new method, which he is confident will be found on investigation to be far superior in natural appearance and durability to any ever before produced in England. They perfectly restore the articulation and mastication, and are not to be distinguished in any respect from the original teeth.—52, Fleet-street. At home from 10 till 4.

TERRO-METALLIC TEETH.

D. A. JONES, Surgeon-Dentist to his Royal Highness the Duke of Orleans, 43, New Bond Street, begs to acquaint the Nobility and Gentry, that, from many years' intense application, he has invented and brought to perfection, a New System of Fixing TERRO-METALLIC, NATURAL, and ARTIFICIAL TEETH, from one to a complete Set, which are so accurately fitted as not to be distinguished from the original, and answer all the purposes of mastication, articulation, &c.—Mr. A. J. continues stopping decayed teeth with his unrivalled Anodyne Cement, which in one minute allays the most excruciating pain; and by this means carious teeth are wholly preserved and rendered useful, even if broken close to the gums. This being a metallic composition, it becomes hard as enamel in a few minutes, will not decompose with the heat of the stomach, and resists the effects of acids, atmospheric air, &c.—Cleaning, and every operation incidental to Dental Surgery.—At home from ten till five.

This day is published, price SIX SHILLINGS.
THE FOREIGN REVIEW, No. VII.

CONTENTS.
 ART. I. The Eloquence of the French Bar.—II. History of Lithography.—III. Damiron, Philosophy in France.—IV. Jovellanos, Life and Writings.—V. Novallas.—VI. Romances of Sir Tristram.—VII. Vitalis, Swedish Poetry.—VIII. Niebuhr's Historical and Philological Tracts.—IX. Guisepoon Ballads.—X. Pecchio, Political Economists of Italy.—XI. to XVII. Select Foreign Publications during the last three months.
 London: Black, Young, and Young, 2, Tavistock-street; Bossange, Barthes, and Lowell, Great Marlborough-street.

No. VIII. will be published in September.

On Saturday next will be published, illustrated by Eleven Engravings on Steel and Wood, small 8vo. 8s.
NO. IV. OF THE FAMILY LIBRARY, being Lives of the most eminent British Painters, Sculptors, and Architects. By ALLAN CUNNINGHAM.

Vol. I. (to be completed in 3 vols.)

Volumes of the Family Library published in July.
 Nos. I. and II. containing **THE LIFE OF NAPOLEON BONAPARTE**. With Fifteen Engravings on Steel and Wood, by Finden and Thomson, the Wood-cuts from Designs of George Cruikshank. Very neatly bound in canvas. 2 vols. 8s. each.—A New Edition.

No. III.—**THE LIFE OF ALEXANDER THE GREAT**. By the Rev. JOHN WILLIAMS, M.A., Rector of the Edinburgh Academy. In 1 vol. 8s.
 John Murray, Albemarle-street.

FOR TRAVELLERS ON THE CONTINENT.
INFORMATION AND DIRECTIONS FOR TRAVELLERS ON THE CONTINENT. By MARIANA STARRKE. Sixth Edition, thoroughly revised, with considerable additions. Post 8vo. 12s.

2. **THE DIARY of an INVALID** in pursuit of HEALTH; being the Journal of a Tour in Portugal, Italy, Switzerland, and France. By the late HENRY MATHEWS, A.M. Third Edition. 2 vols. post 8vo. Price 15s.

3. **ANTIQUITIES, ARTS, and LITERATURE of ITALY.** By JOSEPH FORSYTH, Esq. Third Edition. 2 vols. post 8vo. 15s.

4. **ROME in the NINETEENTH CENTURY.** Fourth Edition. 3 vols. 8vo. 11s. 6d.

5. **SWITZERLAND; or, a Journal of a Tour and Residence in that Country.** Followed by a General View of its History, brought down to the Present Time. By S. SIMOND. Second Edition. 2 vols. 8vo. 24s.

6. **AN AUTUMN near the RHINE; or Sketches of Courts, Society, and Scenery in Germany near the Rhine.** Second Edition. 8vo. 14s.

John Murray, Albemarle-street.

FRENCH LANGUAGE.

This day is published, price 2s. the twenty-first Edition of
A NEW and EASY METHOD of LEARNING the SPELLING and PRONUNCIATION of the FRENCH LANGUAGE. By JOHN PERRIN, carefully revised by C. GROS.

Printed for Harding and Lepard; Longman, Rees, Orme, Brown, and Green; Baldwin and Cradock; T. Boosey and Sons; Hurst, Chance, and Co.; Harvey and Darton; Dulau and Co.; Harris and Son; Simpkin and Marshall; Souter; Baker and Fletcher; and Poole and Edwards; of whom may be had the new edition of

DR. MAVOR'S ETON LATIN GRAMMAR, with the Accents and Quantity marked, by Dr. Carey, price 2s. 6d.

MAVOR'S ETON LATIN GRAMMAR, WITH THE ACCENTS AND QUANTITY MARKED.

This day is published, price 2s. 6d., a new and greatly improved edition, being the XIIth., of

DR. MAVOR'S ETON LATIN GRAMMAR; with Explanatory Notes, and useful additions to assist the learner. This edition has been most carefully revised, and the Accents and Quantity marked, by Dr. CAREY.

The sale of twelve very large editions, within a few years, is the best evidence of the value and estimation in which the notes of Dr. Mavor are held; and the patronage so liberally given, has induced the proprietors to spare no expense in rendering this edition in every way worthy of their support.

London: printed for Harding and Lepard; Longman, Rees, Orme, Brown and Green; Baldwin and Cradock; Whittaker; Treacher and Arnot; J. Richardson; T. Boosey and Sons; Simpkin and Marshall; J. Duncan; Hamilton, Adams, and Co.; E. Williams; Harvey and Darton; Poole and Edwards; Baker and Fletcher; Hurst, Chance, and Co.; Cowie and Co.; Suttance and Stretch; J. Collingwood; and C. J. G. and F. Rivington.

Of whom may be had,
PERRIN'S FRENCH SPELLING, the twenty-first edition. Edited by C. GROS. Price 2s.

POPULAR NOVELS, just Published by Henry Colburn, 8, New Burlington-street.

1. **THE NEW FOREST**: a novel, by the author of 'Brambletye House', &c. In 3 vols. post 8vo.

2. **SIR PHILIP GASTENEYS, a Memoir.** By Sir ROGER GRESLEY, Bart. In post 8vo. 8s. 6d.

3. **OLDCOURT**, a novel. In 3 vols. post 8vo.

4. **ADVENTURES of a KING'S PAGE.** In 3 vols. post 8vo. 31s. 6d.

'If you would know whether virtues or vices keep a man farthest from a court, go to court and learn.'—*Winter's Tale.*

5. **WALDEGRAVE**, a novel. In 3 vols. post 8vo.

6. **DEVEREUX.** By the author of 'Pelham' and 'The Disowned.' In 3 vols.

7. **GERALDINE of DESMOND; or Ireland in the Reign of Elizabeth.** In 3 vols. post 8vo.

8. **RYBENT DE CRUCE.** A Novel. In 3 vols. post 8vo.

9. **RICHELIEU, A TALE of FRANCE.** In 3 vols. post 8vo. £1. 11s. 6d.

Also, nearly ready,
 10. **THE DAVENELS; or, a Campaign of Fashion in Dublin.** In 2 vols. post 8vo. 18s.

INTERESTING WORKS, just published by Henry Colburn, 8, New Burlington-street.

1. **TRAVELS to CONSTANTINOPLE**, in the years 1827 and 1828; by Captain CHARLES COLVILLE FRANKLAND, R.N. In 2 vols. 8vo. with numerous Plates.

2. **THE LOVES of the POETS.** By the Author of the 'Diary of an Ennuyée.' In 2 vols. post 8vo. 21s.

3. **LIFE of JOHN LOCKE**, with Extracts from his Correspondence, Journals, and Common-place Books. By Lord KING. In 1 vol. 4to. with Portrait, £2. 2s.

4. **THE EMPRESS JOSEPHINE'S MEMOIRS**: the Third and Concluding Volume; comprising her Private Correspondence with Napoleon. Post 8vo. 10s. 6d.; in French, 8s.

5. **TRAVELS in TURKEY, EGYPT, NUBIA, and PALESTINE**, in 1824, 1825, 1826, and 1827. By R. R. MADDEN, Esq., M.R.C.S. In 2 vols. 8vo. 24s.

'Mr. Madden's volumes are replete with entertainment.'—*Sun.*

6. **MEMOIRS of LADY FANSHAWE**, Wife of the Rt. Hon. Sir Richard Fanshawe, Bart. Ambassador from Charles II. to the Court of Madrid. Handsomely printed in 1 vol. 8vo. with a Portrait, 14s.

Nearly ready,
 7. **THE BOOK of the BOUDOIR.** By Lady MORGAN. In 2 vols. post 8vo.

THE CORRESPONDENCE and DIARY of Dr. DODDRIDGE, illustrative of various Particulars in his life hitherto unknown, with Notices of many of his Contemporaries, and a Sketch of the Ecclesiastical History of the Times in which he lived. Edited from the Originals, by his Great Grandson JOHN DODDRIDGE HUMPHREYS, Esq. In 3 vols. 8vo. with a Portrait.

THE DIORAMA, REGENT'S PARK, is reopened with TWO NEW VIEWS—the INTERIOR of ST. PETER'S CHURCH at ROME, taken at the entry of the Church opposite the Choir, painted by Mr. Bouton; and the TOWN of THIERS, in the department of Puy-de-Dôme, in France, painted by Mr. Daguerre. In the latter picture the time represented is seven o'clock in the morning; a light fog covers the hills, but the houses are enlightened at intervals by the appearance of the sun; the water escaping from the river through the stones on its banks, and the smoke rising from a chimney, enlivens the scene. In many respects the present have some resemblance of the two first Views represented at the Dioramas, and which brought that establishment into such high repute.

AN IMPORTANT DISCOVERY for PRESERVING and BEAUTIFYING the TEETH and GUMS, ROWLAND'S ODONTO, or Pearly Dentifrice. The high and important character this Powder has obtained from some of the most eminent of the faculty, has induced Messrs. Rowland to offer it to the Nobility, Gentry, and Public at large, as an efficient Vegetable Powder, composed of ingredients, the most pure and rare, selected by an Indian Botanist, and possessing extraordinary powers in realising a Beautiful Set of Teeth—sustains them in pristine purity, whiteness and firmness; averts decay; and strengthens the Gums.

ON UNSOUND and IMPERFECT TEETH, ROWLAND'S ODONTO operates as a renovator! excluding all deleterious matter from its corroding seat, and clearing the way of impediment, producing beauty and stability.

Price 2s. 6d. per Box, Duty included. Each genuine Box has the Name and Address engraved on the Government Stamp, A. ROWLAND and SON, 20, Hatton-garden, which is pasted on the Wrapper.

The Genuine is sold by all respectable Perfumers and Medicine Venders who sell ROWLAND'S MACASSAR OIL and KALYDOR.

This day was published, price 8s. neatly bound,
A POCKET DICTIONARY of the SPANISH and ENGLISH LANGUAGES, New Edition, considerably enlarged and improved from the last Edition of NEUMAN and BARRETT.

London: printed for Harding and Lepard; T. Cadell; Longman and Co.; Boosey and Sons; J. Nunn; J. Cuthell; John Richardson; J. M. Richardson; Baldwin and Cradock; J. Booker; Whittaker, Treacher, and Co.; T. Hamilton and Co.; Simpkin and Marshall; J. Collingwood; Dulau and Co.; Cowie and Co.; Parbury, Allen and Co.; J. Duncan; R. Scholey; Hurst and Co.; W. Joy; E. Hodgson; Smith, Elder, and Co.; Treuttel and Co.; V. Salva; and G. and J. Robinson, Liverpool.

Of whom may be had, price £1. 4s. in boards, NEUMAN and BARRETT'S SPANISH and ENGLISH DICTIONARY, in 2 vols. 8vo. a new edition, with very considerable additions and alterations.

This day is published, in one thick volume, 8vo. price 18s. in boards.

THE FRENCH LIBRARIAN; or, LITERARY GUIDE. Pointing out the best works of the principal Writers of France, in every branch of Literature, with Personal Anecdotes and Biographical Notices, preceded by a Sketch of the Progress of FRENCH LITERATURE. By L. T. VENTOUILLAC.

To make French Literature more generally known, to obtain for it a higher degree of estimation in England than it has hitherto enjoyed, by making both the extent and the value of its stores more familiar to the English public, is the object of the present work, the result of some years' research and application. The more fully to obtain this end, a list in each branch of literature is given of every work (within the author's knowledge), which may be considered deserving of attention. Where various editions of the work are known, the best is pointed out, and the merit of the work itself is established, not upon the author's own opinion, but upon that of the most eminent writers of France and of England; and that a still greater degree of confidence might be obtained for the critical dictum thus introduced to the English reader, although the French criticisms have been translated into English, a reference is always given to the volume and page of every work whence remarks have been taken, so that the reader may not only ascertain their correctness, but, where it may seem desirable to him, may, by turning to the original work, find a full critique on the work in question. In addition to these critical remarks, personal and literary anecdotes have been introduced, partly to do away with the appearance of a mere dry catalogue, and partly because these anecdotes, by making the character of the authors more fully known, tend to throw additional light on the nature and merit of their works. This book, it is hoped, will be found a full compendium of French Literature; and Indexes, on an enlarged and improved plan, are added to give every possible facility for reference, and thus render the work more generally useful.

Published by Treuttel & Wurtz, Treuttel jun., and Richter, 30, Soho-square.

ROYAL YORK BATHS, 54, YORK TERRACE, REGENT'S PARK, near St. Mary-le-Bone Church.—W. JAMESON respectfully informs the Nobility, Gentry, and Public, that these Baths have undergone great improvements, and are now ready for use at a moment's notice, from Five in the Morning until Eleven at Night. The strictest attention will be paid to those Ladies and Gentlemen who may honour them with their Patronage.

TERMS:	
A Warm Bath	0 2 6
Six ditto	0 14 0
Twelve ditto	1 5 0
A Real Sea Water do.	0 7 6
Artificial ditto	0 4 6
Medicated Sulphurous	0 7 0
Prepared Sulphur Water	0 4 6
Dry Fumigating Bath	0 6 0
Vapour of Real Sea Water	0 5 0
Large Plunging Bath	0 1 0
One Month's Bathing	0 10 0
Three Months' ditto	1 0 0
Twelve Months' do.	1 10 0
A Cold Shower Bath	0 1 0
A Warm ditto	0 2 0
A Cold Douch ditto	0 3 0
A Warm Plunging Bath	0 9 0
A Private Cold ditto	0 1 6

The Ladies' Baths, which are separate, the same terms as above.

Real Sea Water. 1s. per gallon.—Genuine Harrowgate Water, 1s. 6d. per bottle.

The Medicated Sulphurous Warm Water Bath is particularly recommended by the most eminent of the Faculty for all kinds of Eruptions of the skin, the Douch Bath for Sprains or Weakness in the Limbs. Also the Fumigating or Vapor Bath for Obstinate Rheumatic or Gouty Affections, and frequently cures long-standing complaints which have resisted the power of medicine.

Experienced Female Attendants for Ladies, from Nine in the Morning until Ten at Night.

Subscriptions to be Paid on Entry.

LIVES OF BRITISH PAINTERS, &c.

The Lives of the most Eminent British Painters, Sculptors, and Architects, by Allan Cunningham. 3 vols. 12mo. London, 1829. Murray.

HAD Milton never existed, would our writers on English poetry have allowed national pride so far to influence their lucubrations as to induce them to under-rate the value of the Epic, to conclude 'that it corresponded not with English art and the determined taste of the country,' and therefore was not to be cultivated? Would our reading public, and those who aim at conciliating the favour by flattering the self complacency of the multitude, have satisfied themselves by indulging in some such reasoning as the following: 'What concern have matter-of-fact mortals, such as we are, with the exploits of gods and furies, of the heroes and warriors of paganism, with the wars and rebellions of supernatural beings, angels, and demons, or even with the existence of man's first parents in Paradise? Such of these things as have really happened cannot recur, and therefore for us are void of interest. No, the subjects of song most suitable to our present state are surely the scenes of real life; scenes with which every individual is familiar, which are adapted to the comprehensions of the multitude, and come home to the bosoms of all men. The true scope of poetry among a domestic and commercial people is to describe with truth and nature their every-day pursuits; the picturesque occupations of husbandmen, scenes of domestic felicity, the amusements of rustic life, and the diverting and innocent sports of children: in subjects such as these we all sympathise; they are intelligible to the commonest capacity; and it is to the mass, to whom poets who expect renown must address themselves, and not to a chosen few, who affect to be more gifted than their fellows, and who dream away their existence in worlds of their own creating. If, however, some latitude must be allowed to the imagination, a sufficient field is offered for its exercise in characteristic delineations of exalted personages. On such themes the fancy may be indulged without giving a shock to truth, and the poetical portrait, individual and circumscribed though it be, will afford ample opportunity for the union of the imagery of poetry with the interest of biography and the dignity of history.'

Ridiculous as such propositions may appear, while we can turn to a 'PARADISE LOST' as the boast of our literature, and know from experience that the number is not small of those who pretend at least to feel and appreciate the most aerial flights of Shakspeare; yet are they not a whit more absurd than the arguments which we daily find propounded in the pages of authors and in the discourses of individuals, and illustrated by the practice of professors, on the subject of another art intimately connected with that of poetry, namely painting.

False views, indeed, concerning this art are but too prevalent amongst us, and the prejudices which exist in regard to it, give constant anxiety to those who desire to see their country assume that rank among nations, as respects matters of taste and the embellishments of life, which she has long held in the political scale; but who disdain to aim at popularity by concurring with those who flatter others, and perhaps deceive themselves, with the persuasion that whatever is with us is as it should be. Such a false notion as regards at least the subject at present in discussion, is an error too fatal to improvement to be allowed to go unexposed.

It is a notion which proceeds only from the grossest

ignorance or the most wilful perversion; for all who sincerely love the arts and are truly anxious to see them flourish, know also the degree of excellence to which they have been carried in other lands, and cannot be so blinded by national partiality as not to perceive the immense inferiority of their own country. We profess ourselves of this class of persons: however often we may have withheld our opinions on the subject rather than provoke the national pride of our readers, or discourage the efforts of artists by urging at unfit seasons the vast interval which lies between the most successful work in painting ever executed amongst us, and the perfection to which that art has been carried by the Italian masters. Yet we would not be so void of spirit, nor have we so humble an opinion of the capacity of our countrymen, as to resign ourselves to contentment with the degree of excellence they have attained, in mere despair of their arriving at a yet higher eminence. The efforts of our living painters present undoubtedly strong grounds for hope, even when measured by the standard by which it is impossible not to desire to see them estimated, namely, that of the highest degree of excellence to which the art has ever attained; but, so measured, it is hope for the future only, and not satisfaction with the present, that can be indulged in.

In the actual state of matters, however, which regard the arts, it is principally the public mind and taste which have need of cultivation: certain pernicious, although plausible notions and prejudices are still pertinaciously clung to; these must be removed before any very satisfactory improvement can be expected from those who depend for the very bread they eat on their success in gratifying the humour of the people. These notions are the same to which we alluded at the commencement of this paper; they are so obviously erroneous that a very few suggestions directed to the particular point, will suffice to expose their absurdity.

What have we to do with the Italian masters and their eternal Madonnas? This is a popular and a fashionable question; and it contains the pith and marrow of all the error that obscures the view which the vulgar (high and low) are apt to take of works of art, and of painting more especially. We fear not to grapple with it, and to reply to whoever makes the objection:—as a lover of art, as a creature endowed with a mind susceptible of being properly affected by its beauties, you have a great deal to do with these same despised Madonnas, much more than you imagine, but far less than with many other things in Italian art, which, uninformed, superficial, and unreflecting as you are, your philosophy as yet dreams not of.

Does a production of art, a painting, aim at merely recording facts? or is its object to work on the feelings of the beholder, to excite emotions in his soul? If the latter, consider how extensive is the range of the emotions of which man taken abstractedly is susceptible! how different those emotions are in their kinds and degree! Think how various even are those which may be excited in the most earthy and stupid of the sons of Adam! What if we hastily run up the scale by a few steps, each one of which might be illustrated by the work of some admired master? What if, having done this, we give a comparative glance at those emotions, for the purpose of satisfying ourselves whether any are more worthy of being entertained than others; whether there be some, the arousing of which bespeaks different degrees of merit in the master whose spell we acknow-

ledge, and develops a higher or lower order of mind in the person affected.

It is not in man, we have been told of yore, to be indifferent to any thing human: the spectacle of the low excesses of the coarsest of our fellow mortals, of the nauseous effects of intemperance, of the unceremonious obedience to the calls of nature, if presented with skill, will succeed in exciting emotion: the more faithful the artist has been to nature, the more lively will be the feeling he awakens: with some, with many, no doubt, (nor will the many be confined to any particular class in life,) that feeling will be one of sympathy, arising, if from no stronger lien, from the intimate connection between joviality and the consequences of brutal excess: with others the emotion must be accompanied by disgust.

The village dance and romp, one of a numerous class, may be placed a step higher in our ladder of emotion-working subjects: the broad-faced merriment, the rude embraces, the awkward postures of assembled boors, make us smile, and the smile it is true is not altogether in ridicule; but the objects that excite our laughter, although to be prized above those that set the stomach revolting, have not generally a very high place in our esteem or respect.

A cord of a finer tone is struck by the sight of that good-humoured couple, who have 'drudged on together through a long life of toil, sharing every burden and every instance, ardent lovers once, and now affectionate friends, the sentiment of half a century's standing. The aged housewife quaffs the renovating liquor handed to her by her faithful mate, and he the while regards with a look of most happy satisfaction the heartiness with which the draught is swallowed. In such a picture no doubt there is a sentiment that touches the heart, but the feeling produced is comparatively slight, and must yield the palm to affections of a higher cast.

Of all the natural sentiments, which is comparable to the maternal feeling? Even in beings of the coarsest mould, (and in every rank of life the modifications are infinite,) the voice of nature is here heard aloud, and whether at the cottage door, or in the elegant boudoir, the mother, with her first-born at her bosom, is a spectacle, whether beheld or imagined, of universal and most lively interest. The picture, therefore, that presents us such a scene, cannot be regarded with indifference; but who will deny that the intensity of the mother's feeling may be heightened by individual character, and is liable to be affected by circumstances? No doubt the natural feeling towards her offspring is full tender in the affectionate-hearted wife of the honest husbandman; yet will not the sentiment in her be of the same high order as that which affects the spouse in whom native delicacy has been heightened by cultivation and reflection; the cherished wife of a hero, idolized by the object of his love, contemplating the fruit of their union, the heir of a renowned name, the child called to a lofty destiny, to whom, in his very infancy, other parents bring their offspring to pay homage.—Who that desires to be a parent could refuse to sympathise in the feelings of so happy a mother? Where is the man whose heart would remain untouched by the representation of a group so blessed? Yet is not this, or even a still more exalted sentiment, that which is conveyed by the pictures of the Virgin and Child? And is it a subject with which we have no concern? Can another be named of such universal interest?

Yet the accidents of active life place man in situations calculated to call forth feelings more various in their range and emotions, more powerful and soul-

stirring than are even those which we experience while regarding a mother's felicity. Imagine a scene of wide extended conflagration, the terror and consternation of all; the energy of the more hardly to arrest the progress of destruction; the general anxiety to preserve life and property; the admirable traits of courage which occur; the affecting instances of filial devotion, and of parental solicitude; the son bearing on his shoulders the decrepid sire; mothers, divided between alarm and gratitude, clasping to their knees the infants whom Providence has preserved to them; parents, whom the flames envelop, still intent on the safety of their offspring! If it be the object of painting to excite emotion, can such a subject as this, when treated by the hand of a master like Raphael, fail of its purpose?

But the reason of man ranks higher than his passions, and the spectacle of the wise engaged in the loftiest exercises of the human intellect, if it excite emotion of a less stormy nature than such a scene as that we have just referred to, will arouse feelings of a higher order, of an interest, quieter perhaps, but not less intense. If the aspect of a man of wisdom and intelligence be imposing, how should we be affected by an assemblage of sages, of the men into whom the largest portion of the divine spirit has been breathed, the Bacons and Newtons of all countries and all ages symbolled forth under the likenesses of Plato, Socrates, Aristotle, and other philosophers of antiquity, in appropriate groups, and whose looks and air and attitudes, no less than their occupations, attest the superiority of their nature!

What if we ascend yet another step to contemplate the blessed mortals with whom 'God conversed, and by whose mouth he deigned to speak,' the Apostles of the new dispensation, announcing the word of truth to the attentive and astonished Gentiles, or the Prophets of old, under all the excitement of divine inspiration!

Or lastly, behold the Son of God—all the majesty of his glory, when the sound of the last trumpet awakens the dead from their slumbers, bidding the gates of heaven open to the righteous, and to the wicked addressing the awful sentence, 'Depart from me, ye cursed.'

Will you, on reflection, persist in preferring what is called the *nature* of the lower school of art to the sublimity of thought that characterises the productions of genius-inspired masters? Are you prepared to confess, that your spirit responds more to the vomiting drunkard of Teniers, than to the Saviour in the Judgment-Seat of Heaven of Buonarroti?

These reflections are not addressed to the author of 'The Lives of the British Painters.' Notwithstanding the sentence quoted from his agreeable little volume at the outset of our article, and one or two seeming inconsistencies to be found in its pages, we have reason to think that his general view of art corresponds with our own, as will be proved by the extracts which we propose to lay before our readers, but which we are obliged to postpone to our next number.

DEVEREUX.

Devereux: a Tale. By the Author of *Pelham*. 3 vols. 8vo. Colburn. London, 1829.

(Second Notice; see p. 433.)

We made in our last number some observations on this work, in which we expressed ourselves very freely against the characters, the general design, and the tone of the observations in the author's works; we stated, at the same time, that some of the separate pictures of society, though adding nothing to the merit of 'Devereux,' as a consistent whole, are yet, if taken apart, very spirited and amusing. We now subjoin an extract, which requires no prefatory account of the personages, and which is not at all connected with the plot:

'Boulainvilliers! Comte de St. Saire! What will our great grandchildren think of that name? Fame is indeed a riddle! At the time I refer to, wit—learning—grace—all things that charm and enlighten—were supposed to centre in one word—*Boulainvilliers!* The good count

had many rivals, it is true, but he had that exquisite tact peculiar to his countrymen, of making the very reputations of those rivals contribute to his own. And while he assembled them around him, the lustre of their *bons mots*, though it emanated from themselves, was reflected upon him.

'It was a pleasant, though not a costly apartment, in which we found our host. The room was sufficiently full of people, to allow scope and variety to one groupe of talkers, without being full enough to permit those little knots and coteries which are the destruction of literary society. An old man of about seventy, of a sharp, shrewd, yet polished and courtly expression of countenance, of a great gaiety of manner, which was now and then rather displeasingly contrasted by an abrupt affectation of dignity that, however, rarely lasted above a minute, and never withstood the shock of a *bien mot*, was the first person who accosted us. This old man was the wreck of the once celebrated Anthony Count Hamilton!

'Well, my Lord," said he to Bolingbroke, "how do you like the weather at Paris?—It is a little better than the merciless air of London—is it not? 'Slife!—even in June, one could not go open-breasted in those regions of cold and catarrh—a very great misfortune, let me tell you, my Lord, if one's cambric happened to be of a very delicate and brilliant texture, and one wished to penetrate the inward folds of a lady's heart, by developing, to the best advantage, the exterior folds that covered his own."

'It is the first time," answered Bolingbroke, "that I ever heard so accomplished a courtier as Count Hamilton reprove, with sincerity, that he could not bare his bosom to inspection."

'Ah!" cried Boulainvilliers, "but vanity makes a man shew much that discretion would conceal."

'*Au diable* with your discretion!" said Hamilton, "tis a vulgar virtue. Vanity is a truly aristocratic quality, and every way fitted to a gentleman. Should I ever have been renowned for my exquisite lace and web-like cambric, if I had not been vain? Never, *mon cher!* I should have gone into a convent and worn sackcloth, and, from Count Antoine, I should have thickened into Saint Anthony."

'Nay," cried Lord Bolingbroke, "there is as much scope for vanity in sackcloth, as there is in cambric; for vanity is like the Irish egling master in the Spectator, and if it teaches the play-house to ogle by candle-light, it also teaches the church to ogle by day! But, pardon me, Monsieur Chaulieu, how well you look! I see that the myrtle sheds its verdure, not only over your poetry, but the poet. And it is right that, to the modern Anacreon, who has bequeathed to Time a treasure it will never forego, Time itself should be gentle in return."

'Milord," answered Chaulieu, an old man who, though considerably past seventy, was animated, in appearance and manner, with a vivacity and life that would have done honour to a youth—"Milord, it was beautifully said by the Emperor Julian, that Justice retained the Graces in her vestibule. I see, now, that he should have substituted the word *Wisdom* for that of *Justice*."

'Come," cried Anthony Hamilton, "this will never do. Compliments are the dullest things imaginable. For God's sake let us leave panegyric to blockheads, and say something bitter to one another, or we shall die of ennui."

'*Vous avez raison*," said Boulainvilliers:—"Let us pick out some poor devil to begin with. Absent or present!—Decide which."

'Oh, absent," cried Chaulieu; "'tis a thousand times more piquant to slander than to rally! Let us commence with his Majesty: Count Devereux, have you seen Madame Maintenon and her devout infant, since your arrival?"

'No!—the priests must be petitioned before the miracle is made public."

'What!" cried Chaulieu, "would you insinuate that his Majesty's piety is really nothing less than a miracle?"

'Impossible!" said Boulainvilliers, gravely,—"piety is as natural to kings as flattery to their courtiers: are we not told that they are made in God's own image!"

'If that were true," said Count Hamilton, somewhat profanely—"if that were true, I should no longer deny the impossibility of Atheism!"

"Fie, Count Hamilton," said an old gentleman, in whom I recognised the great Huet, "fie—wit should beware how it uses wings—its province is earth, not heaven."

"Nobody can better tell what wit is not, than the learned Abbé Huet!" answered Hamilton, with a mock air of respect.

"Paha!" cried Chaulieu, "I thought when we once gave the rein to satire it would carry us *à ple mille* against one another. But in order to sweeten that drop of lemon-juice for you, my dear Huet, let me turn to Milord Bolingbroke, and ask him whether England can produce a scholar equal to Peter Huet, who in twenty years wrote notes to sixty-two volumes of Classics, for the sake of a prince who never read a line in one of them?"

"We have some scholars," answered Bolingbroke; "but we certainly have no Huet. It is strange enough, but learning seems to me like a circle: it grows weaker the more it spreads. We now see many people capable of reading commentaries, but very few, indeed, capable of writing them."

"True," answered Huet; and in his reply he introduced the celebrated illustration which is at this day mentioned among his most felicitous *bons mots*. "Scholarship, formerly the most difficult and unaided enterprise of genius, has now been made, by the very toils of the first mariners, but an easy and common-place voyage of leisure. But who would compare the great men, whose very difficulties not only proved their ardour, but brought them the patience and the courage which alone are the parents of a genuine triumph, to the indolent letterers of the present day, who having little of difficulty to conquer, have nothing of glory to attain? For my part, there seems to me the same difference between a scholar of our days and one of the past, as there is between Christopher Columbus and the master of a packet-boat from Calais to Dover!"

"But," cried Anthony Hamilton, taking a pinch of snuff, with the air of a man about to utter a witty thing—"but what have we—*we* spirits of the world, not imps of the closet,"—and he glanced at Huet—"to do with scholarship? All the waters of Castaly which we want to pour into our brain, are such as will flow the readiest to our tongue."

"In short, then," said I, "you would assert that all a friend cares for in one's head is the quantity of talk in it?"

"Precisely, my dear Count," said Hamilton, seriously; "and to that maxim I will add another applicable to the opposite sex. All that a mistress cares for in one's heart is the quantity of love in it."

"What! are generosity, courage, honour, to go for nothing, with our mistress, then?" cried Chaulieu.

"No; for she will believe, if you are a passionate lover, that you have all those virtues; and if not, she won't believe that you have one."

"Ah! it was a pretty court of love in which the friend and biographer of Count Grammont learnt the art!" said Bolingbroke.

"We believed so at the time, my lord; but there are as many changes in the fashion of making love as there are in that of making dresses. Honour me, Count Devereux, by using my snuff-box, and then looking at the lid."

"It is the picture of Charles the Second, which adorns it—is it not?"

"No, Count Devereux, it is the diamonds which adorn it. His majesty's face I thought very beautiful while he was living; but now, on my conscience, I consider it the ugliest phis I ever beheld. But I pointed your notice to the picture because we were talking of love; and Old Rowley believed that he could make it better than any one else. All his courtiers had the same opinion of themselves; and I dare say the *beaux parsons* of Queen Anne's reign would say, that not one of King Charley's gang knew what love was. Oh! 'tis a strange circle of revolutions, that love! Like the earth, it always changes, and yet always has the same materials."

"*L'Amour—l'amour—toujours l'amour*, with Count Anthony Hamilton!" said Boulainvilliers. "He is always on that subject; and, *sacre bleu!* when he was younger I am told he was like Cacus, the son of Vulcan, and breathed nothing but flames."

"You flatter me," said Hamilton. "Solve me now

a knotty riddle, my Lord Bolingbroke. Why does a young man think it the greatest compliment to be thought wise, while an old man thinks it the greatest compliment to be told he has been foolish?"

"Is love foolish, then?" said Lord Bolingbroke.

"Can you doubt it?" answered Hamilton; "it makes a man think more of another than himself! I know not a greater proof of folly!"

"*Al-mou aimable ami*," cried Chaulieu; "you are the wickedest witty person I know. I cannot help loving your language, while I hate your sentiments."

"My language is my own—my sentiments are those of all men," answered Hamilton; "but are we not, by the by, to have young *Arouet* here to-night? What a charming person he is!"

"Yes," said Boulainvilliers: "He said he should be late; and I expect Fontenelle, too, but he will not come before supper. I found Fontenelle, this morning, conversing with my cook on the best manner of dressing asparagus. I asked him the other day, what writer, ancient or modern, had ever given him the most sensible pleasure. After a little pause, the excellent old man said—'Daphnia.'—'Daphnia!' repeated I—'who the devil is he?' 'Why,' answered Fontenelle, with tears of gratitude in his benevolent eyes, 'I had some hypochondriacal ideas, that suppers were unwholesome; and Daphnia is an ancient physician, who asserts the contrary; and declares,—think, my friend, what a charming theory!—that the moon is a great assistant of the digestion!'"

"Ha! ha! ha!" laughed the *Abbé de Chaulieu*. "How like Fontenelle! what an anomalous creature 'tis! He has the most kindness and the least feeling of any man I ever knew. Let Hamilton find a pithier description for him if he can!"

"Whatever reply the friend of the *preux Grammont* might have made, was prevented by the entrance of a young man of about twenty-one.

"In person he was small, slight, and very thin. There was a certain affectation of polite address in his manner and mien, which did not quite become him; and though he was received by the old wits with great cordiality, and on a footing of perfect equality, yet, the inexpressible air which denotes birth, was both pretended to, and wanting. This, perhaps, was however owing to the ordinary inexperience of youth; which, if not awkwardly bashful, is generally awkward in its assurance. Whatever its cause, the impression vanished directly he entered into conversation. I do not think I ever encountered a man so brilliantly, yet so easily witty. He had but little of the studied allusion—the antithetical point—the classic metaphor, which chiefly characterise the wits of my day. On the contrary, it was an exceeding and naïve simplicity, which gave such unrivalled charm and piquancy to his conversation. And while I have not scrupled to stamp in my pages some faint imitation of the peculiar dialogue of other eminent characters, I must confess myself utterly unable to convey the smallest idea of his method of making words irresistible. Contenting my efforts, therefore, with describing his personal appearance—interesting, because that of the most striking literary character it has been my lot to meet—I shall omit his share in the remainder of the conversation I am rehearsing, and beg the reader to recal that passage in Tacitus, in which the great historian says, that in the funeral of Junia, "the images of Brutus and Cassius outshone all the rest, from the very circumstance of their being the sole ones excluded from the rite."

"The countenance, then, of Marie Francis Arouet (since so celebrated under the name of Voltaire,) was plain in feature, but singularly striking in effect; its vivacity was the very perfection of what Steele once happily called "physiognomical eloquence." His eyes were arched, fiery rather than bright, and so restless that they never dwelt in the same place for a moment; his mouth, as at once the worst and the most peculiar feature of his face: it betokened humour, it is true; but it also betrayed malignancy—nor did it ever smile without sarcasm. Though flattering to those present, his words against the absent, uttered by that bitter and curling lip, singled with your pleasure at their wit a little fear at their causticity. I believe no one, be he as bold, as callous, or as faultless as human nature can be, could be one hour with that man and not feel apprehension. Ridicule,

so lavish, yet so true to the mark—so wanton, yet so seemingly just—so bright, that while it wandered round its target, in apparent, though terrible playfulness, it burned into the spot, and engraved there a brand, and a token indelible and perpetual;—this no man could witness, when darted towards another, and feel safe for himself. The very caprice and levity of the jester seemed more perilous, because less to be calculated upon, than a systematic principle of bitterness or satire. Bolingbroke compared him, not unaptly, to a child who has possessed himself of Jupiter's bolts, and who makes use of those bolts in sport, which a God would only have used in wrath.

Arouet's forehead was not remarkable for height, but it was nobly and grandly formed, and, contradicting that of the mouth, wore a benevolent expression. Though so young, there was already a wrinkle on the surface of the front, and a prominence on the eyebrow which shewed that the wit and the fancy of his conversation were, if not regulated, at least contrasted, by more thoughtful and lofty characteristics of mind. At the time I write, this man has obtained a high throne among the powers of the lettered world. What he may yet be, it is in vain to guess: he may be all that is great and good, or—the reverse; but I cannot but believe that his career is only begun. Such men are born monarchs of the mind; they may be benefactors or tyrants: in either case, they are greater than the kings of the physical empire, because they defy armies and laugh at the intrigues of state. From themselves only come the balance of their power, the laws of their government, and the boundaries of their realm.

"We sat down to supper. "Count Hamilton," said Boulainvilliers, "are we not a merry set for such old fellows? Why, excepting Arouet, Milord Bolingbroke, and Count Devereux, there is scarcely one of us under seventy. Where, but at Paris, would you see *bons vivans* of our age? *Vivent la joie!—la bagatelle!—l'amour!*"

"*Et le vin de Champagne*," cried Chaulieu, filling his glass; "but what is there strange in our merriment? Philemon, the comic poet, laughed at ninety-seven. May we all do the same!"

"You forget," cried Bolingbroke, "that Philemon died of the laughing."

"Yes," said Hamilton; "but, if I remember right, it was at seeing an ass eat figs. Let us vow, therefore, never to keep company with asses!"

"Bravo, Count," said Boulainvilliers, "you have put the true moral on the story. Let us swear by the ghost of Philemon, that we will never laugh at an ass's jokes—practical or verbal."

"Then we must always be serious, except when we are with each other," cried Chaulieu. "Oh, I would sooner take my chance of dying prematurely at ninety-seven, than consent to such a vow!"

"Fontenelle," cried our host, "you are melancholy. What is the matter?"

"I mourn for the weakness of human nature," answered Fontenelle, with an air of patriarchal philanthropy. "I told your cook three times about the asparagus; and now—taste it. I told him not to put too much sugar, and he has put none. Thus it is with mankind—ever in extremes, and consequently ever in error! Thus it was that Luther said, so felicitously and so truly, that the human mind was like a drunken peasant on horseback—prop it on one side, and it falls on the other."

"Ha! ha! ha!" cried Chaulieu, "*le pauvre Secrétaire de l'Académie des Sciences!* Who would have thought one could have found so much morality in a plate of asparagus! Taste this *salafte*."

"But, for my part," said Boulainvilliers, "I think Tacitus is not so invariably the analyst of vice as you would make him. Look at the *Agricola* and the *Germania*."

"Ah! the Germany, above all things!" cried Hamilton, dropping a delicious morsel of *sanglier*, in its way from hand to mouth, in his hurry to speak. "Of course, the historian, Boulainvilliers, advocates the Germany, from its mention of the origin of the feudal system—that incomparable bundle of excellencies, which *Le Comte de Boulainvilliers* has declared to be *le chef d'œuvre de l'esprit humain*; and which the same gentle-

man regrets, in the most pathetic terms, no longer exists in order that the seigneur may feed upon *de gros morceaux de bœuf demi-cru*, may hang up half his peasants *pour encourager les autres*, and ravish the daughters of the defunct *pour leur donner quelque consolation*."

"Seriously, though," said the old *Abbé de Chaulieu*, with a twinkling eye, "the lost mentioned evil, my dear Hamilton, was not without a little alloy of good."

"Yes," said Hamilton, "if it was only the daughters; but perhaps the seigneur was not too scrupulous with regard to the wives."

"Ah! shocking, shocking!" cried Chaulieu, solemnly. "Adultery is, indeed, an atrocious crime. I am sure I would most conscientiously cry out with the honest preacher—'Adultery, my children, is the blackest of sins. I do declare, that I would rather have ten virgins in love with me than one married woman!'"

"We all laughed at this enthusiastic burst of virtue from the chaste Chaulieu. And Arouet turned our conversation towards the ecclesiastical dissensions between Jesuits and Jansenists, that then agitated the kingdom. It was then that Bolingbroke used that magnificent illustration, so significant of all those ecclesiastical quarrels, in which indulging the worst passions is termed zeal for the best cause; and we prove beyond a doubt how intensely we love God, by showing with what delightful animosity we can hate one another! "The priests," said Bolingbroke, "remind me of the nurses of Jupiter; they make a great clamour, in order to drown the voices of their God."

"Bravissimo!" cried Hamilton. "Is it not a pity, messieurs, that my Lord Bolingbroke was not a Frenchman? He is almost clever enough to be one."

"If he would drink a little more, he would be," cried Chaulieu, who was growing gloriously *plein de boisson*.

"What say you, Morton?" exclaimed Bolingbroke; "must we not drink these gentlemen under the table for the honour of our country?"

"A challenge! a challenge!" cried Chaulieu. "I march first to the field!"

"Conquest or death!" shouted Bolingbroke. And the rites of Minerva were forsaken for those of Bacchus."—Pp. 186—206.

TRAVELS IN TURKEY.

Travels in Turkey, Egypt, Nubia, and Palestine, in 1824, 1825, 1826, and 1827. By R. R. Madden, Esq. M. R. C. S. 8vo. in two vols. London, Colburn, 1829.

(Concluded from p. 404.)

THE present state and prospects of the Ottoman Empire engage, of course, a principal place in the attention of our author as of Mr. Mac Farlane; and we trust their united efforts will be successful in dispelling a vast deal of indolent prejudice abroad on this important subject. Ignorance here, as usual, has been fruitful not of doubt, nor of inquiry, but of dogmatism: the government of Turkey is pronounced to be the fittest for its subjects by our fire-side politicians, who know nothing of its internal working; and its acts are affirmed to be no legitimate concern of other powers by grave authorities, equally ignorant of its conduct towards its neighbours. Nor are these decisions grounded on the facts of the case, but announced with all the pomp of general principles in politics. Yet surely it will not be contended that no spectacle of atrocity on the public stage of Europe can justify a departure from the rule of non-interference. And even if the fact that a government exists were to be taken, as these gentlemen would have it, for a proof that it is the best system possible for its subjects, they would be far enough still from having proved that its continuance in a stationary condition is compatible with the advancing growth and culture of its neighbours. It is true that the mere circumstance of lengthened duration is sufficient to establish the presence of some elements of justice and of policy in a system: for even if such elements did not enter at the date of its original institution, they must be supposed to have introduced themselves subsequently, to account

for its obtaining any degree of stability and permanence. But it is quite another question whether these qualities are to be found in a government in just ratio to the wants and the capacities of its subjects: it is a farther question still, whether they so control its conduct as to preserve its place in the federal band of civilized communities. None can be less willing than ourselves to judge of social institutions by their outward forms and lineaments, without reference to the local peculiarities or necessities in which these may find their origin and their justification. But the principles essential to good government are in every age and country the same; for they are identical with the code of human justice, of which the root lies happily deep in human nature, and by their variance or conformity with which must every government on earth be judged. Individual virtue and industry, are they favoured and protected? Political talent, is it fostered and employed? Foreign relations, are they liberal and extended? Such questions are soon answered in Turkey, where the least of all concerns is human existence and enjoyment, and where all that is worked for good is individual or fortuitous. It remains to be seen through what 'abomination of desolation' shall come to pass the end of these things; whether the radical reforms of Sultan Mahmoud will effect the long un hoped regeneration, or whether conquest must (like smuggling) have its swing as civilisation's champion in the last resort.

We insert the following ludicrous description of the *Conversazione* of an Arab man of quality, without too anxiously inquiring whether the admirable humour with which our author has hit off the *quid nunc* circles of Egypt may not owe a poignant stroke or two more to his own original whim than to the characteristic traits of his interlocutors:

'The Navarino business now gave a political turn to their discussions, and many of their opinions of European policy and power were so singular, that I could with difficulty bring myself to believe they were seriously delivered.

'A fierce looking little man with a green turban, high in office, broached the subject of the late battle: "The Giaours have burned our ships," said he, "but God will burn them, hell is a hot couch, and a grievous couch it shall be to them, we are told by the prophet." "Please the Lord," responded a fat merchant, and his Inshallah was doled out with great devotion. "Were all the ships in the world joined against the Sultan in the battle?" asked an Arab Sheikh in the simplicity of his heart; "Ay, all," answered a Ulema of great eminence, "all the Caffres of Fraguistan were leagued against the true believers, how else could they prevail, what ten of them could face one true Moslem? but ten thousand to one are too great odds; and were there not forty thousand of their ships against us?" "Allah Wakbar," said an Effendi, a man of learning, "there is but one God, and if the English were not in Navarino, the Francowa, the Nempowa, and the Muscowa, would now be food for the kelp el bahr!" the sea dogs. "Allah Karim!" ejaculated an old priest, "God is most merciful, it is only the infidels who say that the ships of the sultan were burned; it is impossible, because the Giaours could not burn them." "Callam thaib!" cried a dozen of the party. "It is well spoken, it is the ships of the unbelievers that are burned, not the Sultan's." "Did not the Algerines," said a grave old man, "destroy the entire fleet of the English a few years ago, and where were they to find another all at once? is a ship like a pastek, a water melon? does it fall from the sky? is it like a rain drop? does it fall from the sky?" "Wallah callam thaib!" God was called to witness by several, that it was a good saying.

"The English are a great people," said a young Malim, a secretary of the governor's, "they are a very great people, what razors can be compared to English? what pistols vie with those of England? do not the Pacha's capans come from England?" "It is very true," replied the Ulema, "and they have conquered all the world excepting the dominions of the Sultan. India is theirs, and some say the Indian Moslems are their slaves." "Min Allah, heaven forbid!" exclaimed the priest, "a Moslem under an infidel, it cannot be; the

Lord would not suffer a dog, a Caffre to call a true believer Servant; Min Allah!"

"It is even so," said the Effendi, "and the English now want to be our masters, and they will be one day. It has been long prophesied we must fall; Stamboul will see the son of yellowness, the Russian within her lofty walls, and Maar will be a bone between the dogs of France and England, but the latter must have it." "If either of the Caffres must have it," said the fat merchant, "let it be the French; if we only could keep our money and our women out of their reach, they are good humoured infidels enough, they love *fantasia*, they are always merry."

"It was not easy," said the divine, "when they were here, to keep either our money or our women from the Caffres—confusion to their race; the other infidels plundered the people less; but who loved them more? Were they not both the enemies of God's prophet and his law?"

A good looking young man in an Arnaout uniform, who had hitherto been silent, now gave his opinion of the two powers: "The English Giaours," said he, "have most money, because they have only to send to India for as many ship loads as they please, and they can better afford to pay men for fighting for them than the others. The French bring no money with them; wherever they go they pillage, but they never take a paras away with them after all. Whichever gives the best *thyme*, rations, is the Giaour for an Arnaout."

"Surely," exclaimed the Malim, "you would not draw your sword for a dog, a Christian?"

"For no man who did not pay me," replied the Arnaout, evading the question.

"What, for a Caffre?" rejoined the Malim. "Why not," said the Arnaout, when the business is to cut another Caffre's throat?"

This was a good joke, and every one felt himself bound to laugh. When silence was restored, the lawyer put a question which puzzled the whole assembly exceedingly: "Where is England?" "England," replied the priest, with the supercilious air of superior knowledge, "England is in London!" "La! la! mough kiddi," cried the Effendi, the man of learning; "England is not in London, London is only a belled, a town, but England is in the great sea of the north, it is an island, like America, which is also English."

"That's impossible," said the lawyer, "so great a nation never could be an island; are the people of Scio or Cyprus to be compared to the English, and are not both those places islands?"

"Do the French come from an island too?" said a Sheikh, from Assouan, who had never seen an island but that of Elephantine, "there cannot be many of them then."

"When they were here," said the Malim, "there was no scarcity of them, they were forty thousand strong in Scanderia alone."

"Do not talk of thousands," exclaimed the priest, "*callam millioni*, the word is millions; were they not like locusts from Scanderia to Assouan?" "With ten thousand Arnaouts," said the young soldier, "I would have driven them into the sea, every Caffre of them. How many thousands of English did we not trample on, in Raschid, a few years ago?" "They were five and twenty thousand strong in Rosetta," said the lawyer, "and they were all slain." "Not all," answered the Effendi, "the general got his life, but there were only five thousand of them altogether."

"Five thousand or twenty," cried the lawyer, "is it not all the same thing; were they not all infidels, and were they not vanquished with the sword of Islam?"

"Allah karim," cried the priest, "God is most merciful; such be the fate of all who believe not in the true prophet, to whose name be eternal glory."

"If the Sultan," said the Effendi, "had taken off the heads of the Janissaries a hundred years ago, the law of Islam would now be spread over the whole earth."

"As it is," replied the priest, "are not the true believers like the stars of heaven? who can count them? is not their empire over the whole earth from the rising even to the setting place of the sun."

"It is not in the Frozen Ocean, however," said the Levantine, "there are no Moslems there."

"It is a lie," said the priest, "they are every where, the prophet has said so."

"What, in America?" said the Levantine, "it was only discovered a few years ago!"

"Well, then, if it was not known to the prophet," replied the priest, "of course he had nothing to say to it."

"But," continued the Levantine, in a low voice, "the law of the prophet could not be intended for all mankind."

"It was meant for the universe," said the priest, "and hell's fire is the portion of him who rejects it."

"If every man is bound to fast the Ramadan, from sunrise to sunset," replied the Levantine, "on the pain of reprobation, the Moslems of the Frozen Ocean, where the days are six months long, should feel somewhat exhausted."

"I do not believe it," cried the priest in a fury, "who ever saw a day six months long? who could sleep an entire night of six months long?—no man."

"But I read it in a book," said the Levantine, "written by the famous Volney."

"What is written in the perspicuous volumes of truth," replied the priest, "admits neither of doubt nor disputation: there is not a word in the Koran concerning the days of six months' duration, neither of the nights, therefore I disbelieve it, because it is impossible."

"Kaif," said the Levantine, "do as you please, but truth is one:—a very common expression of the Arabs, and is generally the *no plus ultra* in an argument."—Vol. 2.—pp. 376—383.

THE ROCKITE.

The Rockite: a Tale. London, 1829. Nisbet.

How often have we heard sensible persons say of a book, that if they can only find 'perfect honesty' in it, they can bear with the absence of all other qualifications. And how often have we seen these persons afterwards laying down the book with a much bitter remark against its author, because, though their expectations were so moderate, they had been utterly disappointed.

It would go far towards increasing the charitable dispositions of such persons if they would only consider with themselves, for one moment, what is necessary to ensure perfect honesty in a writer, and how many of all the writers they have met with in the course of their lives possessed that merit. We will leave biography out of the question, the reputation of which is proverbial; we pass over history, for that Sir Robert Walpole, who was a good judge, knew to be false; we will not allude to metaphysics, nearly every writer on which tells some lies consciously, and a great many unconsciously; we will merely speak of what are called works of imagination, when the many temptations at first sight may seem fewest, if these can, in any rational sense of the word, be called 'honest.' Among them, so far as our reading has extended, there is but one who can pretend to that character. Take Shakspeare away, and then point out to us a single man among the noblest and best authors of our land who has not some time or other allowed his personal, political, or religious bias to intrude in such a manner as to destroy the honesty of his work.

Richardson and Fielding will occur to most persons as the best instances; but the villains of the former, with the exception of Lovelace, have never quite fair play, and Square and Thwackem are eternal blots upon the honesty of 'Tom Jones.'

The fact is that the very most wonderful intellectual conformation, we had almost added, the most wonderful felicity of circumstances, is necessary to secure this qualification in a writer. Nothing short of that tranquil power which belonged to Shakspeare because he possessed a fund of humanity superior to any which he has exhibited to us, can be a security for a dramatist or a novelist not taking such interest in some of the feelings which he embodies, as to do injustice to the rest. How that power was

won in the instance when it is most strongly manifested, whether the infant Hercules brought it to perfection by grappling only with the hard realities of nature, or whether there was some superadded discipline to produce that astonishing union of strength and flexibility, will always remain a mystery; but this is certain that even if a mind as great as his were to appear in this day, he would need such an education as few men have ever enjoyed to become equally serene and equally honest.

We thought these observations necessary as a defence of our friends, the literary men and women in Ireland, against whom some very hard and illiberal accusations have been brought. 'Look,' exclaims Jane, 'at that Protestant, pointing to some strongly exaggerated statement of the villainous feelings which enter into the composition of an Orangeman, by the author of the 'O'Hara Tales,'—call you that honest? 'Was ever any thing so unfair as this harangue of a Catholic priest,' exclaims another, referring to a passage in the 'Rockite,'—is that honest? Dear friends, sweet friends, Heaven's for our cause, which is neither Orange nor Catholic, but the cause of good truth and good writing, and be silent that you may hear. Neither of the statements are honest—we know it perfectly well, and yet both of the statements proceed from honest excellent persons, and both of the statements are evidence in favour instead of against their honesty. We will explain our paradox in a few words.

There are some persons who, when two parties are engaged in a fierce strife with each other, can enter thoroughly into the feelings of both, and make us enter into them likewise. Looking to results, this is the only strictly honest class, for it is the only one which leaves a fair impression upon our minds. And this class consists of William Shakspeare, and, probably, of some three other uninspired critics since the beginning of time. Secondly, there are some who, in such cases, can enter into the feelings of neither party, and, consequently, give their own feelings to both. These are, emphatically, the dishonest writers; and they include five sixths of all the persons who attempt to write books. And, lastly, there are some who cannot enter into the feelings of both parties, but can enter into the feelings of one; and this occupying a vastly higher ground than the latter, though immensely below the first, include, in modern times, among many others, almost all the Irish novelists. But since great sympathy with one party of course involves injustice to another, these writers appear much more guilty than those whose incapacity make their impartiality unfair to both. Our readers, however, we trust, will never forget that any person who makes us acquainted with any feelings which we could not get at without his assistance, is a benefactor to his species, and they will not complain of an author for doing much, because he does so now. They will, at the same time, be anxious to guard against assigning too little value to the class of feelings which he is incapable of comprehending, and will be always grateful if they can improve their knowledge of them from some other source.

Upon this ground we very cordially recommend the 'Rockite' to our readers' attention. We admit, without hesitation, that it gives altogether an inadequate and unfair statement of the feelings which influence the Catholic peasantry; and if our readers like its statements for Gospel, in this point they will be imbibing falsehood instead of the truth, which they may obtain if they look for it in the proper direction. But this defect is of no great moment. The feelings of that portion of the Irish nation are expressed in the works of Mr. Banim, with a power and comprehension which leave us and them nothing to wish for. It remains that we should find a friend who will give us the feelings of the other dominant party, who shall show in what way the ideas of law and pure religion connect themselves with their oppressions, as those of liberty and persecuted religion do with the Catholic excesses. This task the authoress of the 'Rockite' has undertaken to fulfil, and she is fulfilled it well. Her book is pleasantly written,ounds in lively and vigorous descriptions, and

often embodies the feelings of her personages in very lively and characteristic language. With her politics we have nothing to do, farther than as they are useful to us in making us understand that to which, but for them, we might have been strangers; and as very high religious feeling pervades the whole story, it demonstrates, we think, the absurdity of a notion which the 'Edinburgh Review' has promulgated, that an Orange novel could not be written—an assertion which we thought ridiculous at the time it was uttered; for there can be no doubt that Orange opinions are fortified by strong feelings of some kind, and what strong feelings of any kind may not find, and ought to find, an exposition?

The following scene, we think, will confirm our favourable opinion of a book, the merits of which we are the more anxious to point out, because its smallness and cheapness might otherwise prevent it from finding favour in the eyes of Burlington-street novel readers.

'Katy hobbled along the road as fast as avarice, her ruling passion, could urge the weary limbs of age. In the prospect of securing the reward, she had ventured on a perilous game. The associates with whom Maurice had last seen her were not sworn members of Rock's fraternity, but mercenary plunderers, whose object was immediate gain, and who would have deemed the traveller's clothes and watch a justification for putting him to death. Cautious, however, to give no offence to the formidable body of Rockites, they had contrived, partly by means of Katy herself, to acquire as much knowledge of their established signs of recognition as sufficed to guard against such implication; and the old woman connived at their barbarities while permitted to share the plunder. From these men she had rescued Maurice, in order to sell his blood at a higher price than they dreamed of valuing it at. She foolishly imagined that the money would be paid to her as soon as the prisoner was in custody, and with this she purposed immediately to decamp; but finding that a mere trifle would be the only recompense until better assurance was received of prosecuting him to conviction, she resolved to keep out of sight, and to find some personal enemy of Maurice who would dare the consequence of appearing against him on the united allurements of profit and revenge, or else to suborn one of the straggling freebooters in aid of her design.

'Guided by their worthless conductress, the colonel and his party wound up the wild and romantic pathway, until the gurgling of St. Kevin's spring warned them that the next turn would bring them close upon its margin, and here Katy pointed out the little niche in the rock, where she purposed awaiting their return; while a stout fellow, formidably armed, was stationed at its entrance. The rest proceeded, and cautiously turning the angle of the rock, formed themselves in the wildly beautiful area to which the well and the round tower imparted a character of interest, as monuments of antiquity; records of man's footsteps, where, but for them, nature had seemed, on a cursory glance, to have reigned untrivalled since those rocks were fashioned. There was a charm of loneliness, a melancholy sweetness not unminged with grandeur, over which even the denuding hand of winter had little power. The fir-tree and the holly abounded, wearing their verdant mantle as in the bloom of spring. A leafless oak stretched its gigantic arms over the well; its rugged bark brightened with the young foliage of an ivy plant that had already wove its way nearly to the summit of the trunk; and on its principal branch flourished in pale green the consecrated misseltoe.

'At a short distance rose a most majestic yew, whose dark and venerable head towered in rivalry above the forest king; and clusters of red berries, pressing amid leaves of variegated holly, lent a glow more vivid than that of summer flowers. The deep azure of a frosty sky and the clear sunbeam darting its radiance on the antique tower left nothing for the eye of taste to wish for. The colonel's nephew forgot his occupation on the first view of so unexpected a scene, and in the undertone of genuine feeling ejaculated

"Beautiful! most beautiful!"

"Aye, William," replied his uncle, with a sigh, "our poor country is a paradise desecrated by spirits of darkness."

'They approached the tower, and loudly summoned its inhabitants to surrender, but, save from a most powerful echo, no response was heard. It was found necessary to explore the apartment, and after a strict and cautious search, unsuccessful of course, one of the party was despatched for Katy, who reluctantly obeyed the command, and more than participated in the disappointment.

"You have deceived us, woman," said the colonel, sternly.

"And what would I get by that but a weary walk and the fear of death? See here, isn't the sods half burnt and the cake crumbled about, and bad luck to the spalpeen, but he's left some token," and she picked up a bright object. On inspection it proved to be a regimental button, which, partly for "good luck" and yet more for "auld lang syne," Maurice had most tenaciously preserved about his person; but, on the preceding night, it had rolled from his pocket unperceived, and now invited the scrutiny of the young police officer. "This," said he, "so far confirms the old woman's story of a discharged soldier, that its owner certainly belonged to the — dragoons, who were disbanded in this country at the last reduction."

"Keep it then," said the colonel, "it may serve as a clue yet."

'The distress of old Katy was extreme, and evidently real. She not only saw the anticipated reward snatched from her grasp, but stood committed with the vindictive confederacy in a manner the most alarming. Naturally shrewd and sagacious, she now endeavoured to dissuade the colonel from giving publicity to the transaction, calling to witness every saint in the calendar she would leave no means untried still to place within his power the object of their fruitless expedition. She told him that all hope of capturing the culprit was totally vain, if it were once publicly known that he was marked and traced; while a prudent silence on the subject would leave them still a fair chance of lighting on him. She recommended a strict search through St. Kevin's boundary, and lamented her hard fortune in losing the reward of her loyal fidelity, in terms strongly characteristic of her ruling passion. A consultation was held by the gentlemen, and Katy's counsel finally adopted; an injunction to secrecy being laid on all concerned, while the colonel and his troop remounted, bearing away the sole and unsatisfactory prize of Maurice's regimental button.

'Katy's next step was a pilgrimage to the distant rendezvous, the concealed head-quarters of Captain Rock. Since the affair of Slievemorán, the former haunt of the gang had been deserted by all but the accustomed retailer of potheen; and a place widely dissimilar from it was selected as affording better promise of security.

'Through a bog of considerable extent, flat, dreary, and neglected, a narrow but deep river wound its eccentric course. Scarcely a shrub arose within the circuit of some miles to vary the cheerless monotony, and so swampy was the ground that few footsteps cared to try its supporting power. Yet almost in the centre of this desert and close upon the river's bank, rose the remains of a stupendous fortress, seated on an artificial elevation, and to all appearance unapproachable, unless by the water, to any but forms of fairy lightness. The river, too, was rendered so unsafe by the immense masses of ruin that had fallen into it, during the lapse of ages, that a boat had not within the memory of man been seen to venture there, and tradition told of spikes and other perilous defences thickly planted between its lazy waters, which generally accumulated against the stony obstructions until they overtopped them and flowed to a great extent beyond their banks in the rainy season; the draughts of summer still reducing them to a compass proportionably narrow.

'Yet across this stream there was a ford of moderate depth and perfect security: along the bog there was a firm track, and to the lawless despots, the midnight legislators of Ireland, these approaches were familiar. The Rock of another district had here established his seat of sanguinary power; and hither did Katy bend her course, with more serious misgivings than had ever before embittered her progress to the Rock council-table.

'On the second evening of her journey, she arrived within half a mile, and proceeded, wrapped up in her blue mantle, whose large hood, shrouding her head and

face, supplied the place of bonnet. The bag was uncut, its nature affording little encouragement to speculate on the progress of such operation, and over the obelinate ridges of coarse matted grass and stunted shrubs, the old woman passed with a difficulty which increased as she approached the building. A mine had been sprung on a small scale to effect the demolition of its stubborn fortress, when Cromwell laid siege to it; and many a masonry fragment lay deeply buried in the bog which had grown up all around it. Obstructions thickened in the traveller's path, and on gaining the foot of the eminence, Katy was glad to rest awhile before she ventured farther.

Night had not as yet closed in, but the black clouds were gathering in the west, with every indication of a storm; and the depth of gloom was more than sufficient to envelop in obscurity the diminutive figure lately moving along the swamp, and which had now become stationary beneath the shadows of gigantic ruins. The remains of an archway stood, or rather impended over the unequal ground, while its corresponding section lay half buried in moors and underwood, at a distance of fifty feet below. Beyond this shattered gateway was a bridge crossing the ancient moat of the castle; and, farther on, the site of a tower, of which scarcely six feet of an unequal wall marked the boundaries; but a deep excavation within, thickly choked up with stones and rubbish, showed where the dungeon was situated. From this spot extended an entire angle of the building, rising to the original height, and displaying its rows of windows in unbroken regularity, but entirely roofless. A turret of considerable dimensions flanked it to the left, and retained in fine preservation its steep and winding staircase, illuminated by successive loop-holes, and terminating in a projection, from whence a noble view of the surrounding country might be enjoyed. This look-out had commanded at one glance an entire sweep from the drawbridge on the left, to the river that meandered on the right of the castle, separated from it only by a strip of ground so swampy as to repel every footstep, even in its drouthy state; and at other seasons overflowed to the very base of the fortress.

But however interesting to the antiquary, this relic of feudal prowess possessed no charms for Katy. She heartily wished it would fall and furnish a tomb to the party whom she expected to find assembled within its recesses. Beyond the allurements of present gain, she had no tie to bind her to their faction. A devotee in religion among those to whom such sanctity might recommend her, she wanted the excuse of even genuine superstition to palliate her outrages on those whom her church anathematized: a sworn leaguer against the government, which she charged with oppression, she would for a bribe have sold her country to a yoke as galling as that which Egypt laid on the necks of the Hebrews. She served the confederacy while it protected and paid her. Incurring, as she had done, the peril of its vengeance, she would have rejoiced in its utter annihilation. And such generally is the character of the instruments with which the work of iniquity is effected. Katy had never yet entered the present abode of the conspirators, but her directions were too full and circumstantial to hazard any error in seeking admission; she waited until the last gleam of twilight was fading, and then making her way across the bridge, she gained the aperture already described at the mouth of the dungeon. A minute or two elapsed before her signals were acknowledged; and then an opening being formed by invisible means, among the heaps of crumbled fragments at her feet, a man's face appeared in the faint glimmer of a smothered light; and some questions were put in the usual figurative style, to which she made the established rejoinders. The aperture widened, and assisted by the hand of her companion, she descended, and soon found herself proceeding through a long, low, narrow, vaulted passage, thickly scattered with loose stones, and charged with an atmosphere scarcely endurable to one just translated from the fresh breeze of the bog. The path was far from being either level or straight; and Katy's resolution began to fail, when the scene suddenly changed. The vault became higher, the air circulated more freely, and she found herself in a misshapen apartment, the centre of which was occupied by a long table of uncouth construction, round which were seated the members of the gang, gathered into parties of three or four, at considerable distance from each other.

In one place, illumined by a thin rush, sat two fellows engaged with an imperfect pack of dirty cards, while two more eagerly watched the game, intent on the success of their bets. A little farther on, appeared some whose enjoyment was derived from the broken can of whiskey, while their haggard countenances displayed a character of heightened ferocity as they recounted their deeds of blood. Some were busily employed fitting flints into their muskets, and repairing the belts and other accoutrements of their lawless warfare; while a solitary dark looking man turned over a large heap of soiled newspapers, selecting and marking such paragraphs as he deemed calculated to excite the bitter feelings of rebel hostility against the governments in church and state. At the end of the table a lamp burned brightly, and beneath its glare lay a heap of notices already penned, and bits of paper prepared for a similar use, on one side of which a diligent scribe was tracing, from the dictation of his companion, a threat of extermination to plunge some defenceless family in despair.

In all this there was nothing new or surprising to Katy, unless in the form and size of the assortment; but at the extreme end of it, stretched on a rude bier, lay what was evidently a corpse, covered with a sheet; and on a sort of table close by it stood the usual insignia of death—a crucifix, with two candles stuck in hollow stands of different sizes, a cup of holy water, and three wooden platters heaped with snuff, tobacco, and coarse biscuits.

A wake was what Katy little dreamed of enjoying in such a spot, and she bridled up with delighted anticipation on beholding the promise of good cheer. The orgies had not yet commenced, and she surmised that the party would experience an addition previous to entering upon them. She had leisure to complete her survey of the abode and its inmates, before any notice was taken of her entrance, beyond the side glance of careless recognition. Secure of her services, under the strong tie of mercenary interest, the gang never wasted upon her any courteous attentions. Seating herself at one end of the rude bench, she commenced sighing and groaning in an under key, and proceeded to expatiate on her devotion to the general cause.

"Silence, you mercenary wretch!" exclaimed the newspaper student, "take your pay, and cease from canting." He flung her a few pieces of money and resumed his employment.

"What is it, honey?" asked Katy after a pause, glancing towards the bier, while she addressed the young man who had been writing the notices.

"Troth and it is a sad tale, Katy," he replied in a low and dejected tone; "he's fallen early, like the green ear beat down in a summer storm. There's blood under that white sheet, and blood must flow to wipe it away."

"And you'll tell me every word on't, Andy dear! Ah, but you're a jewel of a lad; and the civil tongue that never wagged to hurt man or child, nor to mock at old age."

The young man sighed, and a faint colour rose to his cheek as he glanced on the papers spread before him; but ere he could answer, another roughly interposed, "Bad luck to your blarney, you old bugaboo! Have we nothing to care for but tickling your ears with long stories? Pat Hennessy's dead, and he's left many a better man to revenge him. An old crow has a sharp scent after carrion, and you are come for a howl at his wake. More fools they that got broken heads in fighting for the carcass;" and he concluded in a surly muttering tone.

Katy's temper was violent, and now disappointed curiosity, combined with offended pride, completely threw her off her guard; and she angrily responded—

"And a bloodier hate than you bore him never gave the death stroke to Pat Hennessy. A nate boy was he! Carcass! Och, if you took better care of some carcasses, let alone your own; that's well enough looked to, you'd not be letting the best lad among ye be lost and perverted to fatten your spite!"

"What's all this?" cried the newspaper man, in a voice of authoritative inquiry.

"You'll get no more from me," muttered Katy, who felt, with alarm, that she had gone too far.

Many questions were put, to which she gave no reply,

or such as were provokingly evasive; and the altercation was running higher, when a signal from the mouth of the vault occasioned the whole party to arise and range themselves in a line, with looks expressive of reverence, real or assumed, according to the bent of their several characters.

Escorted by two or three fellows, wrapped up in blue surtout coats, and followed by half a dozen others variously equipped, a tall and portly personage now made his appearance, slowly proceeding along the apartment, motioning, as he passed, the sign of the cross, and pronouncing a benediction. Advancing immediately to the corpse, he placed himself at the foot of the bier, while the rest formed a circle about it as wide as the confined space would admit of. More candles were lighted, holy water was sprinkled, and Latin prayers, accompanied with as many ceremonies as could, under such circumstances, be performed, were gone through. The priest then demanded the particulars of the event.

The detail was furnished by him who had been so busy with the newspapers, and nothing was left untold that could excite the indignation or stimulate the vengeance of his hearers. For what purpose the deceased and his companions were abroad in the dead of night, was not explained; but according to the narrator, they had been wantonly attacked by armed foes, and after a gallant resistance, had succeeded in escaping with their bleeding comrade, who died before they could gain a place of concealment. In conclusion, he removed the sheet, and exhibited the still gory wounds that yawned on the face and breast of the ghastly object beneath.

TRAVELS IN NORTH AMERICA:

Travels in North America, in the Years 1827 and 1828. By Captain Basil Hall, Royal Navy. 3 vols. 8vo. Cadell and Co. Edinburgh, 1829.

We scarcely know whether to be more pleased or annoyed at the appearance of these volumes, for though we are gratified at gaining an able and useful work, we are disappointed in finding how much less there is of good in North America than a very natural disgust at the Quarterly Reviewers had taught us to hope. It is best, however, that the truth should be known; and we are persuaded that Captain Hall's performance will tend to spread it in England.

The book is far from being as carefully and neatly written as his work on Loo Choo, or that on South America; but it contains a great deal of strong, lively description, and some admirable homely images. There is much clever argumentation, and we have scarcely discovered any attempt at fine writing. But the protestations of impartiality are too many and too long; he apologises too often to his American friends for telling the truth; and, in reading many of the passages, we remembered the profound observation in 'The Vicar of Wakefield,' that the picture would have been better painted if more pains had been taken with it.

There are two classes of people who delight to praise the United States. Those who think that in a wonderfully short time since their first colonization they have become a highly-peopled and orderly country, and that, taking all circumstances into account, they deserve to be admired; and, on the other hand, those English radicals and American patriots who maintain that Washington is the seat of the best government that ever existed; that the polity of the United States is a model for that of all other nations; and that their people are, if not the most civilised, the most moral, the most high-minded in the world, they are, at all events, in a fair way to be so. It is only with this latter class that Captain Hall, or his reviewer, has any quarrel.

We are as much inclined as any American to point out the prosperity of the United States as the most remarkable instance that the modern world has seen of successful colonization. Twelve millions of men living together under the government of law, up to a certain point instructed, and capable of defending themselves against aggression, would at any time have been a considerable portion of the human race. Such the people of the United States are:

but they lay claim to a far more important place among mankind than these characteristics would assign to them. They say that among them a great social experiment is tried for the improvement of the world; that men never were so free or so enlightened as on the banks of the Chesapeake and the Mississippi; and that the institutions by which they are there governed call out virtues and faculties superior to all that the history of the earth records. These would, in fact, be tame and feeble sentences among the self-eulogies of the North Americans. They are, in their own eyes, the wisest, the most heroic, and the best of men; and they constantly anticipate a period when, all other countries having fallen into decay, America shall be the head and front of human society, in place of doating and decrepid Europe.

The ground which the Americans assign for this exultation, is their democratic government. They tell us to look at the map of the people in any other country, and to compare them for intelligence and worth with those of the United States. Among them there is no distinction of ranks, no privileged classes, no hereditary power, nor monopolising sect; the people govern themselves, and are degraded by no superior authority to their own.

Let us consider for a moment how stands the fact before we look at the American reason. The only persons whom this enlightened nation would describe as their great men, were formed while the States were under the English rule. They have produced no eminent thinker, and not a book of any value to the world, except two or three pamphlets by Doctor Channing, and the writings of Washington Irving. Rome, to be sure, did not give birth for many ages to a single book; but Rome had statesmen and heroes, whose like can hardly be found in the history of modern Europe, much less in the meagre and trivial annals of the North American democracy. There is, indeed, comparatively little wretchedness among them, for England sent out her colonists to a land which a thousand years would scarcely suffice to fill. Men multiply there, but they also dwindle; and the mass which is collectively imposing seems to contain no individual to whom we can point with satisfaction, and say 'this is a MAN.'

Now for the cause. The Americans attribute what they call their greatness, to their unmingled democracy. To it also we attribute whatever is peculiar among them, whatever cannot be clearly derived from the influence, the laws, the religion, and the national character of England. It has been the direct design of legislators, and sometimes the secret tendency of various political forces, to sustain the ideal of humanity by raising up from among the crowd, selected classes of men, to surround them with dignity and privileges, and require of them, for the benefit of those over whom they are exalted, peculiar accomplishments and functions. Thus lifted up, they have often attempted to separate their position from all notion of duties attached to it, and have grown aristocratic or priestly oppressors. While on the other hand, when the people, by means of the culture which only these corporations could give it, have begun to think that they had an independent power, and could stand alone; they have rebelled against the supremacy of the privileged classes, have given over all political rights to be exercised by a numerical majority; and as the foolish, the ignorant, and the vicious, are ever the most numerous, human nature has in their commonwealths been always degraded to the lowest level of the crowd. So fell Athens, even though slavery made its free populace, in some respects, an aristocracy. So fell too Rome. So, for a time, France was sunk even below the point to which its despicable nobility, and detestable church had lowered it. To this the preachers of the ballot-box would bring down England. And to this are the United States daily labouring to reduce themselves, while the accident of their position in an unoccupied continent prevents the immediate disorganization which physical wretchedness would otherwise produce; and delays at the same time the commencement of a reaction, which at some future period, when the mob

are tired of obeying even themselves, will necessarily give them masters.

Every page of Captain Hall's work displays, in one respect or other, the debasing influence of this unredeemed ochlocracy. Literature, religion, manners, education, government, all are falling together, down to the comprehension of the many. For where the million govern, it is an aristocratic insolence to think what they cannot understand, to know what they have never learned, to propose plans by which they cannot at the moment profit, to uphold, in any way, the rights and powers of the individual mind. To this kind of feeling the Americans have an evident propensity. It must not be expected, however, that it will develop itself fully amid the counteracting influences for which they have not to thank themselves or their constitution, but laws, a language, a literature, a religion, and some political customs, derived entirely from Europe, and still maintained in the world, not by the patronage of the legislators at Washington, but by the reverence of England for her ancestral inheritance, and by the action of European thought and example on the Trans-Atlantic mind.

The effect of unrestrained democracy is traced by Captain Hall through many particulars of life and opinion, in which we cannot pretend to follow him. The parts of his book which do not relate to this subject are many of them extremely graphic and agreeable; and from his account of his own sensations at Niagara, we suspect that he has narrowly escaped being a philosopher. We congratulate him on enjoying the much more profitable and distinguished station of Post-Captain and Tourist.

We add a curious statement as to the book market in America.

'In America, there is no system of mutual concert and assistance amongst the publishers of books, as there certainly might be, though not very easily, and greatly to the advantage of the public and of themselves. The praiseworthy and spirited exertions of some leading persons in this line of business, to accomplish the point in question, have been always unavailing, and, consequently, there is not at this moment the slightest concert, nor any combined system of subscribing and circulating books, according to the practice in England. It is true many of the circumstances are very different, as I shall presently show; but still plans might easily be devised, which would greatly advance the cause of literature, could 'the Trade,' as they are called, be brought to act cordially together.

'No foreigner, unless he be a resident in the United States, can take out a copyright in America, either openly or by indirect contrivance. An American publisher, therefore, who succeeds in obtaining a copy of a book written in Europe, may reprint and put it into circulation, without sharing the profits with the author, or having any connexion with him at all.

'More extent of sale, it may be observed, is the grand object aimed at by the American republishers; and as nothing secures this but low prices, competition takes the direction of cheapness alone. This circumstance affords a sufficient explanation of the miserable paper, printing, and binding, by which almost all reprinted books in that country are disfigured. It is very true, they serve their purpose; they are read and cast aside, or, if kept for any time, they inevitably go to pieces. Except in the large cities, in the houses of the wealthiest persons, or in public institutions, there is no such a thing to be seen as a library. Undoubtedly, a vehement passion pervades America for reading books of a certain light description; but there does not exist the smallest taste, that I could ever see or hear of, for collecting books, or even for having a few select works stored up for occasional reference. In truth, the rambling disposition of the great mass of the people, their fluctuating occupations and habits of life, even in their most settled state, and various other causes, some domestic, and some political, puts it out of their power to form libraries;—at all events, be the causes what they may, very few individual persons ever seem to think of such a thing—a transient perusal being all that is looked for.

'Messrs. Carey and Lea, of Philadelphia, the repub-

lishers of the Waverley Novels, who happen to be persons of the highest activity, not merely as tradesmen, but as men of letters and science, always get over, at some considerable cost, the proof sheets from England, and having printed a large quantity, throw them into the market before any other English copies can have reached the country. These spirited publishers are sure of a certain amount of profit, in consequence of the avidity with which the works in question are welcomed by the public; the number printed being generally, I believe, above ten thousand. In consequence of the momentary monopoly which these gentlemen enjoy, from obtaining the proof sheets to print from, and thus securing the priority of publication, they are enabled to put a small additional price to each copy above what the book will eventually bear when brought fully into the market from other quarters. But they must take great care not to fix the price one cent higher than the anxiety of the public will counterbalance.

'A Waverley novel, which in England is printed in three volumes at 31s. 6d., is republished in two volumes at 8s. 6d. In the course of a few days afterwards, however, it is often republished on coarser paper and in a smaller size, for several shillings less, and, before many weeks have elapsed, copies are sold for a dollar, or 4s. 3d., and sometimes even cheaper. The price of the American edition of Sir Walter Scott's *Life of Napoleon*, reprinted in three volumes octavo, was 4½ dollars, or about 20s. In England, it was 94s. 6d. Within a short period after its first appearance, it was again republished and put into circulation for two dollars and a half, or about 10s. 6d., being little more than a ninth part of the original English cost. The materials and the execution of these works, compared with those of the original, bear a pretty fair proportion to the above differences in price. But if the original republishers at Philadelphia, guided by their own excellent taste in these matters, were to attempt to get up the works in question in a more respectable style, and consequently at a higher price, the edition might lie on their shelves till doomsday!

'The sale of a book does not go on from month to month, or from year to year, as with us—the whole being over in a few weeks, or, at the most, months; consequently, the printer who is most expert, and most ingenious in cheap devices, makes the most profit while the public curiosity is alive. The precaution used by Messrs. Carey and Lea, of getting out the sheets of any new and popular work before its appearance in England, does not always afford them even a temporary security against competition. Upon one occasion, indeed, they very nearly sustained a heavy loss. They had received, by various opportunities, all the sheets of a Waverley novel but one, and as fast as they received them, printed off about ten thousand copies of the work. The packet, in which this unfortunate last sheet was dispatched, sailed from Liverpool on the 1st of the month, up to which time the book had not been published. But it happened, perversely enough, that a ship which sailed from Liverpool some weeks afterwards, arrived at New York on the same day. In the interim between the sailing of the first and the last of these two vessels, the book made its appearance in England, and a complete copy, sent off by the last opportunity, reached America at the very same moment with the anxiously looked-for missing sheet, sent by the first ship.

'The publisher, a man of great energy and promptitude of purpose, who was waiting at New York for the arrival of the packet, boarded her before the anchor was gone, got hold of his prize, and galloped back to Philadelphia. The unlucky sheet was straightway set up in a dozen different printing-offices, which were kept in motion night and day, by relays of workmen, till the book was not only completed for immediate sale on the spot, in Philadelphia, but, by means of carriages posted on the road, a couple of thousand copies were actually ready for distribution at New York within six-and-thirty hours after the arrival of the ship! Thus the missing pages had first to travel ninety miles before they reached a printing-press, then to be worked off, stitched, packed, and returned to New York, all in a day and a half, so as to supply the market before any of the publishers of that city had time to enter the field.

'It is amusing to think that cases may, and I believe have occurred, in which the early sheets of one of these

works have been printed and ready for publication on the other side of the Atlantic, when the conclusion of the story was yet unwritten on the banks of the Tweed!

'At first sight, it seems hard that English publishers should reap no benefit whatever from this extensive part of the circulation of their works. But, on the other hand, as long as there is little or no home literary manufacture, it is so obviously to the advantage of America to keep clear of the entanglement of copyrights, and every other species of monopoly in books, that no statesman of that country could venture to propose a change, or indeed could reasonably expect to carry any measure, having for its object the advantage of foreigners, to the manifest injury of his countrymen. Were the balance of letters equivoiced between the two countries, it might then, naturally enough, be the subject of discussion and mutual adjustment; but the case is quite different.'—Pp. 356—363.

As a means, however, of improving the taste and information of America, our author strongly recommends the removal of the duty of 30 cents, or about 15 pence per lb. charged on imported books.

TIMBUCTOO.

Timbuctoo: a Poem, which obtained the Chancellor's Medal at the Cambridge Commencement, by A. Tennyson, of Trinity College, Cambridge.

We have accustomed ourselves to think, perhaps without any very good reason, that poetry was likely to perish among us for a considerable period after the great generation of poets which is now passing away. The age seems determined to contradict us, and that in the most decided manner, for it has put forth poetry by a young man, and that where we should least expect it, namely, in a prize-poem. These productions have often been ingenious and elegant, but we have never before seen one of them which indicated really first-rate poetical genius, and which would have done honour to any man that ever wrote. Such, we do not hesitate to affirm, is the little work before us; and the examiners seem to have felt about it like ourselves, for they have assigned the prize to its author, though the measure in which he writes was never before (we believe) thus selected for honour. We extract a few lines to justify our admiration:

'A curve of whitening, flashing, ebbing light!
A rustling of white wings! the bright descent
Of a young Seraph! and he stood beside me
There on the ridge, and look'd into my face
With his unutterable, shining orbs.
So that with hasty motion I did veil
My vision with both hands, and saw before me
Such colour'd spots as dance athwart the eyes
Of those, that gaze upon the noonday sun.
Girt with a Zone of flashing gold beneath
His breast, and compass'd round about his brow
With triple arch of everchanging bows,
And circled with the glory of living light
And alternation of all hues, he stood.

"O child of man, why muse you here alone
Upon the mountain, on the dreams of old
Which filled the earth with passing loveliness,
Which flung strange music on the howling winds,
And odours rapt from remote Paradise?
Thy sense is clogg'd with dull mortality,
Thy spirit fetter'd with the bond of clay:
Open thine eyes and see."

'I look'd, but not
Upon his face, for it was wonderful
With its exceeding brightness, and the light
Of the great Angel Mind which look'd from out
The starry glowing of his restless eyes.
I felt my soul grow mighty, and my spirit
With supernatural excitation bound
Within me, and my mental eye grew large
With such a vast circumference of thought,
That in my vanity I seem'd to stand
Upon the outward verge and bound alone
Of full beatitude. Each falling sense
As with a momentary flash of light

Grew thrillingly distinct and keen. I saw
The smallest grain that dappled the dark earth,
The indistinctest atom in deep air,
The moon's white cities, and the opal width
Of her small glowing lakes, her silver heights
Unvisited with dew of vagrant cloud,
And the unsounded, undescended depth
Of her black hollows. The clear galaxy
Shorn of its hoary lustre, wonderful,
Distinct and vivid with sharp points of light,
Blaze within blaze, an unimagin'd depth
And harmony of planet-girded suns
And moon-encircled planets, wheel in wheel,
Arch'd the wan sapphire. Nay—the hum of men,
Or other things talking in unknown tongues,
And notes of busy life in distant worlds
Beat like a far wave on my anxious ear.'

How many men have lived for a century who could equal this?

The Legend of Einsidlin, a Tale of Switzerland; with Poetical Sketches of Swiss Scenery, &c. By the Rev. William Liddiard. Saunders and Otley, 1829. 8vo. pp. 283.

THE writer of these poems is evidently a person of great sensibility to the beauty of external nature and of moral association. We think that we can discern in his poems traces of his having read attentively the writings of nearly all our modern English poets, and we are happy to see, from a reference to Drayton, that he is a lover of our elder literatures. There are throughout the volume many marks of ingenuity and taste, mingled, we must add, with a good deal of carelessness. The chief defect is the want of that poetic ear, without which no one can hope to give pleasure throughout a long poem. Forced constructions, obscure periods, and inharmonious lines destroy almost all the effect of Mr. Liddiard's fancy and feeling.

Sharpe's London Magazine. The Three Chapters for July, 1829. Sharpe, Piccadilly. 8vo.

We ought sooner to have noticed this new periodical, if for no other reason, yet for the celebrity of some of the names connected with it, and the beauty of an engraving which it contains, from one of Wilkie's foreign pictures. The collection of papers is, on the whole, pleasant; and two or three of the articles are really excellent. We had hoped from hearing that Mr. Allan Cunningham is the Editor, that we should have had something more nearly resembling the First Series of the 'London Magazine,' to which he was a distinguished contributor. But we are sorry to see that the present number exhibits a good deal of the slang, slip-slop, and violence which are so much more amusing than respectable in Blackwood, and which, if accompanied with less degree of talent than is shown in the clever billings-gate of that work, becomes extremely disagreeable. We want a magazine with rather more gravity and variety than the New Monthly, and rather less ferocity and vulgarity than Blackwood; and we very sincerely wish that Mr. Allan Cunningham would supply the deficiency. Nothing can be more beautiful in any respect than the plate which accompanies the present number. The greater portion of the papers are worthy to accompany it; and we trust that when the second number shall appear we may be delighted with all its contents.

Italian Tales, by Luigi Angeloni Frusinate, with Analytical Translations, and a Key to writing Italian on the Principles of the Hamiltonian System. By P. O. Skene. Longman. London, 1829.

THE Italian language is scarce in prose writers, whose works are fit to be put into the hands of youth, so that masters are reduced to one of three alternatives; either to keep prose altogether out of the hands of their pupils; to run the risk of corrupting their morals by allowing the perusal of obscene and immoral productions; or of spoiling their style and taste by silly and ill-written books, such as the anecdotes of Rolandi.

The first of these resources is that most generally resorted to; the most prudent teachers omit the study of Italian prose, and launch at once into the reading of the poets. From this premature acquaintance with Italian poetry, it arises that the language of foreigners attempting to express themselves in that tongue, either by speaking or writing, becomes a strange mixture of poetical phrases with their own native idioms.

The inconvenience we complain of has been remedied by the Tales of Signor Luigi Angeloni, who has expressly written them with a view to supply the acknowledged defect in Italian literature. As a political writer his style has been admired even by the bitterest enemies of his doctrines; and in his Tales, his Italian is no less respectable.

The little work is rendered more useful by the literal English translation of Mr. Skene, and his Hamiltonian Key for reading and writing Italian. This gentleman is the only man who, with philosophical consistency, has brought the Hamiltonian system to anything like practical perfection; and as his translation of 'The Conspiracy of Venice,' of St. Réal, and of 'The Story of Little Jack,' are now the principal works for the study of the French language, we entertain little doubt that the Italian Tales of Signor Angeloni will become, through his means, the chief elementary work in the study of Italian.

Lessing's Fables in German, with a literal English Translation. Taylor. London, 1829.

It was a happy thought to render popular in this country the Fables of Lessing. This author, although he lived at the end of the last century, having flourished from 1729 to 1781, is the first German prose writer. His style is manly and concise; and the amateurs of German will find in this book a collection of original and spirited fables, adapted to both sexes and to all ages. The literal translation is excellent, especially that of the two first books, in which the translator has given the original text, word for word, in English, without changing the construction. It is desirable that in a future edition the third book should be treated in the same manner as the two former. Even as it is, however, this work deserves to be recommended to all teachers and schools, as well for the sake of the text as of the translation, which will serve to render the German language more easy and agreeable.

Retirement: a Poem, by Thomas Stewart, Esq. 8vo. pp. 48. London, 1829. Ridgway.

THIS is a collection of very flowing and careful lines, with scarcely enough of that strength which either in imagery, passion, or thought, is necessary for the popularity of a poem of the present day.

The Foreign Review, No. VII.

WE have not read the whole of the present number of an excellent work; but we have examined several of the articles, which appear to us very satisfactory. That on 'Novalis,' (which is evidently, we think, by the distinguished translator of 'Wilhelm Meister') is no less powerful than all the other writings we have seen bearing the marks of the same hand.

SHADES OF THE DEAD.

NO. II.—ALEXANDER THE GREAT.

THERE is a kind of philosophy adapted to drawing-rooms by which the characters of all conquerors would be at once given over to unmingled and indiscriminate abhorrence. The shedding of human blood is thereby described as something so detestable, that only the last necessity can justify it. We are told that men should visit with curses the memories of those who have given rise to contention and slaughter; and that the meanest peasant is more deserving of respect than victorious kings or triumphant generals. The heroic ideal is brought into contempt by the most ignorant, and the weak and the narrow-minded exult in their philanthropic wisdom, while they expose the real evils of what are called the military virtues.

Nor will any one question that it is a bold and weighty matter to be the immediate cause of pain and death to thousands. For though it might be hard to prove that the sufferings of the soldier are greater than those of other men, or that they are not overbalanced by the enjoyments of activity and hope, yet he who begins a war does doubtless become in truth the direct originator of many miseries. But, alas! what great good was ever achieved for mankind without accompanying sorrow? The greatest benefactor of the world, the teacher of truth, can hardly accomplish his task without uprooting some old sympathies and disturbing the minds which he enlightens. In the education of an individual, his will can be strengthened only by subjecting him to rude and fearful trials. Neither can any great national revolution be brought about which shall not give pain to many. We must judge the leader of every important change with reference to the thought which guided him; we must see whether the shock, the excitement, the exaltation of his name, the pride of transitory victory, were the objects for which he was willing to subdue the immediate impulses of charity; or whether he regarded the innovations, and contests, and bloody triumphs as evils necessarily attendant on a far higher and more lasting end; misfortunes, as much as possible to be diminished by a wise man, but for the avoiding which no effeminate timidity should induce him to sacrifice a great object.

This will not justify such a conqueror as Napoleon, who had no other than a personal purpose, and who was willing, for the attainment of it, to crush whatever was most valuable in Europe. But it will serve as a defence for the general spirit of Roman enterprise, for the conduct of the Spaniards in America, and of the English in Hindostan. And in truth if we are to lop away from the existing culture of Europe whatever has been gained by the results of conquest, we should leave but a meagre and decaying stem. For how large a portion of the character of Christendom may be traced to the Roman and the Teutonic domination! And scarcely has there been a polity capable to save any nation from sinking into a horde of savages, that has not been founded on a conquest. Conquest has been the great instrument of almost every revolution that has improved the world, and we in England have especially little pretence for denying its beneficial results. The Celtic barbarism was unable to advance human nature beyond the point at which Cæsar found it in Britain; and the Romans brought to the country laws, arts, and Christianity. The institutions had decayed, the national character was weak, and we were strengthened by Saxon blood and youth; but the nation remained apart and hardly at all connected with the other portion of the Christian commonwealth; and the Normans, while they introduced their superior refinement and their riper chivalry, became a bond between England and the rest of Europe. All these co-operated to one end, and that was our actual England.

The oriental war waged by Alexander the Great would have come close, in the eyes of every Greek

(had it stood on no other ground), to one of direct self-defence. It was the prolongation of a contest which had endured for many generations, and in the course of which Greece itself had been twice ravaged by hordes of Asiatics, and its fairest city made a spoil. The Grecian patriot, nourished from his boyhood on the Homeric songs, and accustomed to hear of the names of Miltiades and Themistocles as the greatest glories of his country, and of the oppression of the Ionian cities as the chiefest wrong done to a free people by barbarians, could scarcely conceive of any relation between Greece and Persia but that of deadly hostility. A peace was then no more than a truce, a temporary interruption of that warfare which was the natural condition of all countries not bound together by a common language and worship.

The wealth indeed of the Asiatic satrapies, and the factious divisions of every city which made the losing party seek for assistance even from the enemies of his race, brought about some change in this state of things. The neighbouring peril of Macedonian predominance led the greatest of unsuccessful statesmen to receive from the ministers of Darius the money which might enable him to resist Philip. But the laws of political society and the circumstances of the world were stronger even than the will and intellect of Demosthenes, who opposed himself and the fame of Athens against a power to which Phocion, taking calmer council, resolutely submitted. A man of genius, king of Macedon, was necessarily leader of Greece; but let it not be forgotten that, by the same necessity, Greece, having a leader, was conqueror of Asia.

The knowledge, cultivation, and energy accumulated by free institutions, by traditionary religion, by philosophy and the arts, within the circling seas and mountains of the Hellenic land, must have overflowed on the surrounding countries. Without the aid of Philip or Alexander, bands of mercenary soldiers, intriguing politicians, and ambitious chieftains, would have torn the empire of Darius, and made the language and the thoughts of southern Europe familiar in the palaces of the eastern satraps. The methodised and accomplished mind would have found its way to the barbarian thrones, with a current as sure and perpetual as that which pours the waters of the Danube into the sea. But the supremacy of a monarchy was necessary to give singleness and concentration to the efforts of the many jealous cities. Greece needed to be split into numerous republics, that it might put forth the first bright fruits of human cultivation; but the hand of a kingly leader was required to gather and to spread the seeds on the banks of the Orontes and the Nile. This was the office of the King of Macedon.

Demosthenes failed in his opposition to it and him, for the time had come when mankind could gain no more by the continued independence of Thebes or Athens. Democracy had done its utmost for Grecian culture, and thereafter could only be mischievous in popularising and enfeebling the civilisation which it had in many respects advanced. The internal ministry of Greek activity was nearly at an end; and to make it available for the world, a leader must have been found with a more stable and unquestioned title than the vote of a populace or the influence of one among many co-ordinate commonwealths could possibly furnish. He must have been of Grecian race and language, for he was to guide men of that race, and to spread abroad the rich nourishment of that language. It behoved him to be captain of all Greece, for he was to go forth as its representative, and he needed at the same time a support other than the Peloponnese or Attica could supply; for amid envies, factions, and revolutions, that would have been physically inadequate. Above all, it was necessary that in soul and talent he should display whatever either of thoughtful or heroic power the philosophy of the wisest schools could call forth and cherish in human nature; for to mankind and to posterity he was to present himself as the impersonation and champion of the highest culture of that country, which nothing but its moral superiority could entitle to civil predominance. All this was necessary, and it all existed in Alexander.

Supposing Greece to have been freed from those inward distractions which nothing but Macedonian guidance could have, in fact, allayed, it would have been able, by a succession of various impulses, to rend, to seize, or to mould large portions of the Persian empire. Alexander had been educated between Philip and Aristotle, and looked to do more than this. A hundred teachers, innumerable statesmen and warriors, a noble traditional religion, the most wonderful artists that ever existed, many pregnant varieties of polity, had made the country of his fathers what it was, and therein had given him the means he was to employ. The broad and barbarous East was spread before him, full of tyrannies old and new, decayed institutions, oppressed races, undeveloped powers, and in these and in the hopes of the vulgarst Greek a common man might have found a mighty object without bestowing on them any deep reflection. But beyond fame and domination, the ends which almost the very circumstances pointed out, and which were, at all events, proclaimed by the hopes of the populace, and by the names of Pausanias and Xenophon; beyond these, Alexander found in himself an end higher and more permanent, for he was born with unequalled capacity, and his mind was the complete outward result of that method in thought which has given their godlike stations to Socrates, Plato, and Aristotle.

He was the man of Greece, and was to impress on the continent of Asia not only the skill and valour of his country in the field, but also its reverence for religion, and its power as a creator in the arts, and in moral and political wisdom. He knew that his mission was nobler than either like a chief of free companions, to plunder and lay waste; or, like an oriental conqueror, to trample on all previous rights, institutions, and convictions, and substitute for them the grim and solitary idol of his own supremacy. He went forth to conquer indeed, for by the sword alone could the despotism of the sword be broken; but he went also to raise up, to guard, to renew, to cultivate; and first clearing away, with his iron engines, the hard successive strata of former tyrannies, to lay bare to the sky, to water and fertilize the soil beneath; to permit the secret seed to grow, and to mingle with it many new and some exotic germs. That this is neither dream nor fable, that Alexander was neither a madman nor a ruffian, nor an adventuring knight, would have seemed obvious from all his history. But, unhappily, he left no commentaries behind him; he had no Thucydides nor Livy to chronicle his greatness; and his memory has remained only to excite the wonder of the crowd, the detestation of pseudo-philosophers, and the admiration and reverence of a few retired students.

The first year of Alexander's reign was no more than a loud and complex overture to his after life. His only object appears to have been to subdue and awe the invaders of his kingdom, and the rebels against his federal authority, so that he might begin his great eternal enterprise with the utmost possible rapidity and effectiveness. He performed a series of exploits which (if truly narrated to us) were sufficient to have placed a Roman consul on a level with Camillus and Scipio; but they were merely the transitory and stormy dawn of that day which brought the great luminary of Greece from its rising on the Thermaic Gulf till it set on that of Persia.

The first recorded deed of the Grecian enterprise is singularly consistent with the purpose of the whole expedition, and with the education and character of Alexander. He visited and honoured the spot with which tradition had associated the names of Homer's heroes and his local descriptions. He had been taught through all his boyhood to delight in lays which, besides their poetic value and their relation to the tendency of his mind as a king and captain, had the merit of recording a portion of the great struggle between Europe and Asia, and of displaying in the brightest light his noble ancestor, the swift-footed and god-descended Achilles. All history announced that these poems were the lovely flowers of that Asiatic Greece which now lay helpless and enslaved under the sceptre of the great king, and which

Alexander was about to liberate; and they were thus in every way the work naturally, as it seemed, pointed out to be the manuals of his education. The strength of their influence over him was shown by his first proceeding on the soil of the eastern continent. By performing religious rites on the plain of the Troad, he publicly put away from Macedonia the character, which it bore in the Homeric times, of a barbarous country, apart from Greece, and sending forth its chieftains to combat, in alliance with the Asiatics. He who sacrificed at the tomb of Achilles, and made the Homeric works his daily study, constituted himself the representative of the Hellenic mind and the champion of its cause; and when we know that he went to battle with a shield preserved from the days of Agamemnon borne before him, it is not easy to avoid the fancy that those ancient kings and warriors, whose memories he had celebrated, and who live for ever so brightly in the songs of the heroic age, moved round him and before him from the plain, the mounds, the rivers, and the sea of Troy to the hills of Bactria and the banks of the Indus.

But in how different a spirit from that of the traditional ages did he make war against his enemies. It was his aim to found a larger polity, embracing an immeasurably greater variety of circumstances and habits, and acting by a more complicated mechanism than Grecian statesmen had before conceived. And how uniformly, therefore, and earnestly did he, conqueror and innovator as he was, and creator of a fresh epoch in the history of the world, how constantly did he seek to find, if possible, old foundations for his new establishments; how abhorrent was all his system, a far more benevolent and enlightened one than any before imagined, from the attempt to root out and desolate the old convictions of mankind. He sought to strengthen men's belief and hope in their social condition; to put life into the heart of the world; and to substantiate, in a political body, the subtle and potent spirit of the highest philosophic culture. He did not enslave, massacre, or plunder. But wherever he subdued men, he was ready to respect their human nature. Wherever he found any vestiges of ancient law and order, he zealously restored them; wherever any religious faith, he also did worship to the gods revered by his subjects; wherever skill, valour, industry, he encouraged and rewarded them; wherever open enmity, he met it, overcame it, and then forgot it. To pursue the footsteps of this wise and accomplished genius, would require a comment on every action of the busiest of lives for ten pregnant and unexampled years. But there is a unity of purpose in a great man's conduct which may be comprehended and admired without illustrating it by all that his life would furnish for its display. And in the history of Alexander, above all, is it evident that he had made for himself a generous and permanent scheme of policy, scarcely, as it seems, to have been learned from Aristotle, and certainly opposed to the views of the democratic writers of Greece.

He acted differently from almost all the conquerors of whom he could have read, and differently from those former heroes of legendary song who, probably, were the ideal of his personal feelings; for in him was blooming the latest ripeness of Grecian thought, and he who sacrificed to Achilles, Hercules, and Bacchus, and exceeded in war their traditional exploits, was also to show forth the practical results of whatever laborious knowledge and profound meditation of human affairs his country could glory in. And, therefore, instead of finding in him a wild and reckless adventurer, careful only to outstrip the hurricane, and, like it, to lay waste his path, we see in Alexander the severe judge, the benignant fosterer, the man who delighted to pause in his career of humbling subjugation, and recreate the world with more than kingly generousities, with the rites of a beautiful worship, and the shows and splendours of poetry,—the creator of cities in the solitude, and of commerce in the barren haunts of robbers.

There are other conquerors to whom genius equal with his has been popularly attributed, but between whom and him an essential difference is observable.

The talent which has been shown by some vulgar, modern captains is all displayed in the means and mechanism they have employed; their object was utterly poor, low, narrow, and personal, that of the meanest and weakest-minded of men. The ingenuity and boldness of Alexander in pursuing his end were not inferior to those of any recent idol; but his vast, his unapproachable superiority, was in the greatness of that end itself. Others with vigorous faculties, and large means at their disposal, have endeavoured to lessen and compress whatever they came in contact with, that it might be the more suitable to the intrinsic pettiness of their purpose. They have sought, for instance, to cut off from society the action of many of its chief springs, such as religion, or historic remembrances, or the possibility of personal independence; to enfeeble and beat down the world till it should lie like a crushed and blotted mantle beneath the feet of him who has slain its wearer. Alexander habitually cherished and invigorated whatever feeling and thought he discovered in any nation; his mind even went beyond what moral energy the world contained, and he aimed at increasing it on all sides by the wise arts of the statesman, and of founding on it the power that should govern an immeasurable empire.

But it may be replied, in all this Alexander failed. And, indeed, the reality was far below the thought; for if the world would conform itself to a great idea, we should see the mound of primeval Eden opening out until it should become the only limit of the globe; but, in the measure and fashion in which earthly affairs will yield and assimilate themselves to the conception of genius, the design of the Macedonian conqueror was realised. Shall we say that nothing was done in the stir and loosening of all the roots of thought designedly produced by these wars and this policy? Did civilisation not gain any thing when the world, for the first time, saw a General improving all that he subdued, rather than enriching himself by his appropriations? Can that language, of which the very vocabulary has more of wisdom and poetry than the literature of other tongues, have been communicated to vast regions, and have taught them nothing? Or what shall we say of the many cities the fair posterity of Alexander, surviving when the blood of his offspring had passed away, and preserving so many centres and radiating points of knowledge; of the soul of Greece inhabiting and informing a new frame on the borders of the Nile when it had ceased to find a resting-place on the banks of Ilissus? Or can the result have been contemptible of that mixture and inter-communion of the old polytheisms, which, by taking somewhat of its peculiar character from each, and weakening the exclusiveness of the hold of all over the minds of nations, was probably a great and necessary preparation for the reception of Christianity?

We know not how far the story of the Macedonian meeting with the High-priest of the Jews may have been altered by the vanity of the people through whom it was transmitted, or adorned and rendered wonderful by the talents of Josephus. There is something so impressive in the image of the young conqueror covered with the dust from the shattered walls of Tyre, bending to the name of God, and proclaiming that his minister had before appeared to him in a vision, that every one, but for our modern dread of the marvellous, would be inclined to believe in it. There appears no reason for denying that a spirit like Alexander's, intent, far-seeing, and imbued with the highest revelations of a religious philosophy, may so have brooded among his native hills, over the field that lay open to his enterprise, and the truths which he had learned to revere, as to perceive that, much as he might do for the world, the circle of its moral capacities would yet remain unfilled; that the unity of God could hardly be made by him to supplant the anthropomorphic polytheisms of the nations; and a shaping imagination would then have naturally impersonated, in the form of a celestial instructor, the truth which no one, but by the fore-knowledge of faith, could then expect to become popular. This may have taken place in the mind of a pupil of Aristotle; and the supposition

will explain the reverence and awe of the young commander for a priest presenting himself as the teacher of that great principle which was unknown beyond Judea to any but the wisest masters of science, and their most favoured pupils.

The legend, even if legend it be, is at all events remarkable as bringing together the representatives of the two greatest moral forces then existing in the world, of Grecian thought and Jewish religion. The two afterwards allied themselves in the Egyptian city of Alexander, and conjointly gave a powerful impulse to the mind. Their perfect conciliation and union remained to be effected by Christianity.

Whether this last great consummation was in any way connected with the influence produced by the Grecian conquests on the Heathen modes of belief, is a difficult and perilous question. Most persons will probably think that there is much of mischief in all similar speculations, and will, it is to be hoped, at the same time maintain that Alexander is not to be judged by what we can discover of the distant consequences flowing from his deeds.

It would be melancholy indeed if any theory as to the evil results of a great man's actions, when those themselves were evidently generous, arduous, and the fruits of noble conceptions, should be allowed to rob Fame of her children and human nature of its loftiest examples. Shall the praise of courage, gentleness, endurance, magnanimity, and zeal in high purposes, perish, because a man who died before he had reached the middle term of life, could not complete the largest design that ever animated a statesman or general? Or shall we consider but as a mad adventurer the soldier whom Aristotle advised to treat the conquered as slaves, and who preferred the far more difficult and less glittering attempt to make them subjects of a temperate rule, and citizens of a legal polity; the young and chivalrous leader, who, when the wisest minds of Greece could perceive no radical distinction between nations but the broad difference of Greek and barbarian, studied, comprehended, and turned to the advantage of all, whatever was valuable and characteristic in each of twenty races. We may measure the importance of his life by the permanence of Grecian influence in Asia, till all was swallowed up in Rome; and the loss sustained in his death by the confusion and agonies of empires which succeeded his domination. He perished, having lived scarce more than thirty years, still meditating, on his death-bed, mighty designs for the future; and leaving behind him as his trophy, the noblest empire that had ever existed. The funeral games that celebrated his decease, were contests for kingdoms; and the mantle of the Macedonian soldier was divided into the imperial robes of many monarchs.

SWEET bird that thro' the budding boughs art flinging
Notes of such wild and tremulous delight,
That round my very soul their web is clinging,
Inwoven with the dancing waters light,
And with the feathery wood's melodious sighing,
Now bursting forth, full as a pillar bright
Of flame upsprung, now fading tenderly,
As 'twere an angel winging its slow flight,
The soul of music in sweet sadness dying,
Would I could float like thee,
Within the sphere where thou apart dost sit,
By thy own flood of melodies concealed!
For never yet, I think, to mortal wit
Hath such surpassing vision been revealed,
Or lesson given of such deep mystery
As thou proclaimest in sounds, to them who listenest be:
Time was, when on my solitary walk
The stars shone kindly, when before my feet,
Turn wheresoe'er I might,
The meadows lay asleep in sunny light,
And skies and streams, and every vision bright
With love and joy, my heart of hearts did greet.
Then daisies trembling on their curved stalk,
The violet-studded bank, the pebbly rill,
The crocus and the shaded daffodil

Spoke to me in the music of delight,
And with strong incantations, strong but still,
Within my soul awoke its deep indwelling might!
Why past these glorious powers, this strength, away?
Oh, gentle bird, alas, what had I done,
That for so many days the beautiful face
Of nature, with its many-figured grace,
Lay like a blank before me! Twilight dun
Enveloped me like a pall! Oh, happier lot,
In midnight to be lost, by no dim ray
Of light, called back to think of the clear day,
Which we, with perverse spirit, have regarded not!
Oh, joy! to feel again,
The old affections wake at thy sweet strain!
I feel, I feel thy joy,
Thou happy creature, thou whom no annoy
E'er visited! Oh, pleasant power,
To win the ancient dower
Of natural happiness; to hear the stream
Thus musically babble to the beam
Of noon-tide, and the whispering leaves repeat
The old undying melody, and greet
An abiding spirit in my soul, which springs
Out of myself to joy with all created things!

TO THE EDITOR OF 'THE ATHENÆUM':

SIR,—The beastly, lying 'Press' has such a natural, in born love of low, filthy falsehood, that when it has no particular purpose to serve by lying, still it will lie merely for lying's sake. The knavish gang has been working for the last twenty years to injure me; and I suppose when it and the 'Thing' had contrived to drive me out of the country, and plunder me of all I had, they thought they had got rid of William Cobbett. But here I am again in spite of all the 'Thing' and the 'Press' could do; and here I'll stay in spite of them, and Sidmouth, and their 'Power of Imprisonment' bills, to work the downfall of the 'Thing,' and the lying knaves who live by it, which, I hope, please God, to see before I die, unless the 'Collective,' in their wisdom, pass a bill for dissecting me alive, and denying me Christian burial. Now, I observe, that when these base, hireling wretches stop a moment from their chief and constant employment of *slandering* me, they must find some other victim for their scurrility. And I observe, that their natural hatred of anything like talent and honesty always leads them to fasten on any body who particularly deserves praise.

There is a very charming singer at the Italian Opera, called Madame Malibran. I won't attempt to describe her person, her singing, or her acting, because I'm sure no language that I am master of would give my readers any conception of the admiration I feel for her. She isn't yet one-and-twenty—and so beautiful! I'm sure, if heavenly beauty ever was displayed on this earth, Malibran's is such. Her voice has a wonderful compass, the lower part of it being particularly fine. But her acting is above all comparison the finest I have seen. I grant that Pasta is very admirable. But Malibran is equally good in comedy and tragedy: she has certain excellencies which Pasta has not; whatever defects we may presume to discover in her, I have no doubt age will correct.

Her father was Garcia, the famous tenor. She appeared in England five or six years ago, and was much admired. But her father about that time found out that there was no good in his living here, merely to pay taxes to rascally placemen—so he went over to the United States of America, where, thank God, there are no taxes raised more than are necessary for the government of the country, in order to pamper the insolence of lazy, good-for-nothing sinecurists. And here this beautiful creature married Malibran, whom I recollect well, one of the richest, I may almost say, the richest, banker in New York. But

all rag riches must have an end: so a few months after her marriage, Malibran's bank stopped payment. I won't stop here to consider the misery occasioned by this to hundreds of thousands of honest people; but only think what must have been the feelings of this sweet woman, suddenly reduced from elegance and affluence to utter want! Reader, won't you join with me in cursing the beastly Rag System, and the ugly, lying *feelosofer* who uphold it? It was lucky that she was no fine 'Madam,' brought up to think it disgraceful to get her own and her husband's livelihood by honest industry. Instead of moping and repining, and only adding to her misery, she strived to remedy it, and came over here to sing.

I am very fond of the opera, and always go when I can, particularly since last year, as they have not required me to dress so much like a Tom Fool, as before. I don't want a 'stall,' because I am neither a horse nor an ass, and there are always too many of the latter kind alone for all the stalls they have: so I go to the pit, and generally take my seat in one of the front rows, where I hear and see well. I go there to hear and see, not to stand staring and gaping at all the base, smudgy-faced, aristocratic fools, who parade themselves in the boxes to show how much taxes they eat.

Well, you may be sure I did not miss going to see Madame Malibran soon after she came, because I wished to see any body who had lived in a free country, and because I had a fellow-feeling for any one who was a victim of the vile paper-money delusion. I went—I saw her—I heard her. Never, no never, have I felt so pure ecstatic a thrill of pleasure but once, and that was when I heard that Castlereagh had cut his throat at North Cray, in Kent. I have been every night since, *that she has performed*,—(I like some of the others, but not so much as her), and my admiration for her has only grown the greater. Any body might have seen me any of these nights in one of the two first rows. I always wear a black neckcloth and a blue coat.

I never read the base lying papers; but one day I thought I would look into them to see if they could speak truth on any subject which had nothing apparently to do with me. Will these scoundrels, thought I, abuse this woman because I admire her? Or will they think it necessary to vilify her in order to uphold the VILE PAPER-MONEY SYSTEM? Or will they run her down simply because she is every thing that's good and charming? I'm sure I can't make out what was the excellent reason, but sure enough I found the whole, base, mongrel pack of carrion-fed curs had opened their nauseous mouths in one beastly discordant yelp against her. Old lying Anna Brodie, of 'The Times,' of course, was in front of them all; for, to do Anna justice, whenever there is any thing base to be done, she is always the first. You never saw such a heap of lies as the beasts had collected—such filthy venom, such gross, impudent imposture. But it's one consolation, that no one believes any thing they say. One night 'Otello' was advertised, and the next day base old Walter, or some other of Anna's 'jontlemen,' stuck in one of the calumnies which he calls criticism, giving a 'full, true, and particular account' of the performance of 'Otello'; whereas I, and every body else who had been there, knew that the said 'Otello' had not been performed that night, some other opera having been substituted for it. Now, you'd suppose that such a gross blunder as this was enough to stop even Anna's impudent jaw for a time. No such thing. On goes her 'jontleman' reporting, and *cratacaizing*, and slandering charming Madame Malibran, till the other day out comes another bouncer. After abusing Malibran's Romeo, Anna praises Sontag's performance of Giulietta. Are you stone-blind, Mother Anna? Are you deaf? Or is it all a parcel of lies from beginning to end, and you weren't there at all? I can hardly believe that even you, Anna, are so beastly sottishly stupid as not to know Sontag from Castelli. But it's no matter what Anna says, because no one believes what she says. The other 'daily papers' are just as bad, except, to be sure, old *feelosofer* Black, who has let some decent person praise the

angelic creature in 'The Chronicle.' Brave, Scotchman! When you're hanged I'll remember this good deed, and make interest with Jack Ketch to tie the knot under your left ear, and put you out of pain quickly.

But the weekly papers are even worse. Two, in particular, have been more base than all the others: I mean a thing called 'The Spectator,' and another nauseous thing called 'The Literary Gazette.' As for 'The Spectator,' I shall not refute any of its low, filthy stuff; because, to do so, I must insert some of his odious remarks, which I don't mean to pollute these pages with, because I wish them to be read by modest women.

But I mean to say a word more to the hireling who vomits forth 'The Literary Gazette,' because he has insinuated a malignant calumny, which ought to be contradicted without delay. I do not know who is the filthy Scotch hireling who writes 'The Literary Gazette,' but I see the name of one Scripp at the end of it; and I shall treat him as the writer of these vile calumnies which he is vile enough to publish. This Scripp, I have no doubt, is also a Scotchman, a vile, dirty-faced, dirty-handed, dirty-minded Scotchman. The libel of which I complained—But no, I'll tell you the truth first, that you may see the full enormity of the calumny.

Last Saturday fortnight, Madame Malibran acted Romeo. When she fell down dead in the last scene, the sweet young woman was so intent on her acting, thinking of nothing else, that she quite forgot to take care of herself, and gave her arm a desperate blow against the floor; some say she cut it against a piece of glass which had been left there by accident. She was very ill in consequence: I heard she fainted the next day at the Catholic Chapel, in Warwick-street. Of course she could not act all the next week; and, as Laporte behaved in a very shameful manner, she took the precaution of getting a doctor's certificate, and publishing it in the papers. Well, we were obliged to do without her all that week; and the sun didn't shine; and horrid rainy weather it was, and did much harm to the crops. Last Tuesday, however, she felt herself rather better, and acted Rosina. Sweet creature! she looked very pale, and had her arm in a sling, and whenever any body came near it she winced, as if the very motion of the air hurt her. I never saw her lovely face so lovely; she never exerted her sweet voice more; and, in spite of all her pain and fright, never did she act with more archness and spirit. She was so ill in consequence of these exertions, that she could not appear in a new and difficult part, which she had undertaken to perform for Curioni's benefit, on Thursday. It appears she offered Curioni to play any one of three other parts; but, I suppose, he did not wish to run any chance of her injuring herself, and accordingly the benefit proceeded without her. Of course this injured the benefit, and I'm sorry for this, for Curioni's sake.

Now, the base papers insinuated base stories against Madame Malibran, and said she was shamming; and this base Scripp actually printed these words in his vile journal of lies which appeared the next Sunday:—'Malibran is never a very sure card, (witness her undoing Curioni's benefit on Thursday, after all his trouble in preparing a treat of a new and attractive order.)'

Now, Scripp! base Scotchman! stop scratching your head for two minutes, and listen to me. Do you see this white, shining, cubic substance which I hold in my hand? This is a substance which you have never seen before, but perhaps you have heard of it:—it is called SOAP. It possesses wonderful properties. Pour hot water on it, and rub it over your face and hands. When you have done this for six weeks, and furthermore rubbed these parts of your body with a hard scrubbing-brush, they will probably lose some of their present blackness, and become—not white, but, possibly, grey. I see you stare, and wish to try the experiment. Well, only listen to me, and I'll make you a present of two cakes of soap as large as this.

* We give this article, as we found it among the papers in our letter-box: satisfied with its internal evidence of authenticity, we confess that we have taken no further pains to ascertain if it be really from the pen of the renowned person whose name is subscribed to it.—ED.

Do you think, Scripp, because you have long ears that you are a judge of music? Do you think your knowledge of the bagpipe gives you a right to 'cree eceze?' Do you really think, Scotchman, that having the Scotch fiddle makes a man a musician? No, ignorant, vile Scotchman; hold your tongue about these affairs, and keep to your 'leeterature' and 'felosofy'; or, if you must be gabbling about in your vile Scotch accent, don't be flinging dirt on such a noble creature as Malibran.

What do you mean by saying, in your low, filthy, gambling-house language, that she isn't a *sure card*? Does it mean that her health is uncertain? and that, when she's too ill to sing, she can't sing? If not, what does it mean? Do you mean that she could sing and wouldn't, and that she purposely spoilt Curioni's benefit? Could she help undoing it, as you call it? Can you prove that she didn't hurt her arm? Can you prove that the doctor's certificate of her illness was false?

Let us suppose, Scripp, for a moment, that you have some of the common feelings of a man. Did you ever hear of doing to others as you would be done by? How should you like, if you were ill, to have such insinuations directed against you? Madame Malibran injured her arm in a zealous discharge of her duty. Suppose you were to do so in the discharge of your business, which, to do you justice, you do with quite zeal enough. Suppose, some Saturday night, you were to strain your arm in writing some lie too big even for you to manage. Suppose, in consequence, that the next morning your bundle of falsehood and folly could not appear, so that all the Grub-street hacks and milliners were disappointed of their Sunday dinner of nonsense and slander. Suppose that, in consequence, one of these hacks or milliners was to make a great outcry, and say you weren't a *sure card*? Would you think that fair?

And now, Sawney Scripp, I'll speak to you in language you can understand. I bid you, in your very next number, contradict those low falsehoods; I bid you say you lied, and that you're sorry for it. Its only eating your own words; a beastlier mess, to be sure, even than the 'parritch' which you make from the oats which you steal from the hackney-coaches. I bid you carefully to abstain from writing about Malibran ever again. You've no business to pollute her name by uttering it in your harsh Scotch accent.

Now, Scotchman, you must have a reason, I suppose, for doing what I tell you to do. I'll give you two good Scotch reasons. First, if you do as I bid you, I'll give you a whole sheep's head; and if you do it handsomely, I don't care if I give you the tripe and trotters into the bargain. Second, if you dare to disobey me, on Monday next I'll go to your rascally dog-hole, pull you out from under your wife's petticoats, stop your nasty mouth with a pitch-plaster, and give your vile carcass to the 'Collective' to dissect.

I can't say any more, Mr. Editor, because I expect a man who is coming to buy some of my young beech trees, (which, by the by, are very thriving,) and I must go into the City afterwards. I send you this, because I see you have not joined in the vile conspiracy against me and Madame Malibran. You let a red-haired Scotchman write against me in your paper last year; but even he was more civil than the vile 'daily-press,' and spoke a few words of truth.

My 'Register' is quite taken up in putting down the 'THING' and the 'RAO SYSTEM'; so that I may send you some more notices on matters connected with the fine arts.* Your's,

WILLIAM COBBETT.

I have sent Madame Malibran a bushel of my best Indian corn as a token of my esteem for her.

* We shall be most happy to find, at all times, space in our columns for the 'straight forward' views of so honest a correspondent: the more readily so, from our firm conviction that no personal consideration can have influenced his able vindication of a lady in whose cause he has shown himself so zealous a champion.—ED.

UNIVERSITY OF LEIPZIG.

Leipzig, 1st July, 1839.

Dear Sir,—Though the subsequent details are by no means so complete as I could have desired, yet they will serve to convey a tolerably correct idea of the character and present state of our flourishing establishment. When more leisure is at my command, I will endeavour to supply the omissions with which it is chargeable.

In the year 1409, two thousand discontented professors and students, members of the 'German Nation,'* abandoned the University of Prague and came hither: hence originated the foundation of the University of Leipzig, by Frederick the quarrelsome, then elector of Saxony. This prince and the greater part of his successors, particularly the elector Augustus, (who reigned from 1555 to 1586), and King Frederick Augustus (from the year 1768 to 1827), were zealous patrons of learning, and liberal friends to the University, either in the first stages of its establishment, or in after times, when they endowed it with lands derived from the suppression of monasteries at the Reformation, and assisted it with pecuniary means, a portion of which was directed to special purposes out of their own private purses. From these sources, combined with bequests and endowments originating with wealthy members of the University, and occasionally assigned to specific objects, our institution has acquired a pretty considerable extent of funds, consisting of landed estates, houses in the town, woods, capital at interest, corn, and other items. This property is administered by officers appointed by the University, and is carefully applied to the various purposes for which the several endowments were created. The University† possesses a complete jurisdiction of its own, both civil and criminal, extending over all its members, professors, students, and functionaries, as well as all men of letters, physicians, surgeons, and lawyers, who may settle in Leipzig after they have completed their studies. Of the tribunal, by which this jurisdiction is exercised, the rector is the president or *præses*; its other members are the ex-rector, his predecessor, and three others of the professors; but the rector and members going out of office every six months, and every professor being qualified to sit, there is a perpetual judge of the University in the person of a Doctor of Laws, to whom an actuary and two registrars are subordinate.

There are four faculties, viz.

1. *Theology*, in which there are four professorships of ancient institution for Moral Theology,

* There is no portion of the constitution of universities so ancient as that of the classification of their members by separate nations. In the twelfth and subsequent centuries, this denomination implied knots of teachers alone, or of students, or of teachers and students, natives of particular countries, who were congregated into privileged corporations without any reference to the department of learning or science, which they taught or studied: they elected their own regents and officers, enacted their own statutes, and had their own privileges, treasures, schools, archives, places of assembly, festivals, and peculiar usages. The origin of this institution has been traced by some writers to the sophists of the fourth century, whose schools at Athens possessed classes, which somewhat resembled the classification by nations peculiar to the oldest universities of the middle ages.—Meisner's Gesch. vol. 1, p. 29—32.

† I apply this designation to our high school in the fullest and, until lately, the true and original meaning of the word: as a corporation instituted by the state, and distinguished by peculiar privileges, especially that of exercising a local and independent jurisdiction over its members and pupils, as being a spot where every branch of learning and science is taught, and as enjoying the right of conferring degrees; not as being a mere *lyceum* or academy, where there is no universal instruction afforded, and no degree conferred, but where the student walks in and walks out at the beck of his curiosity or caprice, irresponsible to any jurisdiction in his scholastic character, and in this sense, unrecognized by the laws and legitimate institutions of his country.

dogmatics, pastoral science, and homilectics, and history of the church and dogmas; besides one professorship of modern institution for exegesis.

2. *Jurisprudence*, in which there are five professorships of earlier foundation for Roman law, the law of nature, ecclesiastical, feudal, and criminal law; and two professorships of modern foundation for natural and national law.

3. *Medicine*, to which are attached four professorships of ancient institution for pathology and physiology, therapy, anatomy, and surgery; and four professorships of modern date for chemistry, clinical medicine, obstetrics, materia medica, and botany.

4. *Philosophy* possesses ten ancient professorships; viz. Grecian and Roman literature, eloquence and poetry, the theory of philosophy, practical philosophy, history, eastern languages, politics and political economy, mathematics, and natural history; and four professorships of modern foundation; statistics, natural history, husbandry, and technology.

The ancient chairs are supported out of the revenues of the University, and the appointments vary from 90*l.*, 120*l.*, to 150*l.* a-year; but the modern professorships, the incomes of which vary from 45*l.* to 90*l.* per annum, are endowed out of the revenues of the state, or by funds assigned by the Regent.

There is a greater or less number of extraordinary professors attached to each faculty, whereof that of philosophy alone possesses from twelve to twenty; those of this class, who distinguish themselves by their erudition, and the copiousness of their prælections receive an annual remuneration, varying from 15*l.* to 45*l.*, and defrayed out of the public revenue.

The ordinary professors are bound to lecture gratuitously four hours, and the extraordinary professors, two hours per week, upon subjects within the range of the faculty to which they are attached.

In connection with each faculty are five, ten, twelve, or more private lecturers, who must hold the rank of doctors in their respective faculties, and must have publicly maintained a printed thesis of their own composition: this entitles them to deliver lectures, but they do not receive any official remuneration.

Besides public prælections, every professor and lecturer gives as many extra lectures per diem as he thinks fit, and the fees for them are left to his own discretion. The half-yearly cost of each course varies from fifteen to thirty shillings.

Independently of the functionaries, which we have already enumerated, the state provides in part for teachers of the principal foreign languages, fencing, gymnastics, dancing, riding, drawing, painting, engraving, and music.

At the beginning of every half-year, there appears a printed announcement of the several lectures, which will be delivered during the ensuing six months by the respective professors, lecturers, and teachers.

No restrictions are imposed upon the student; it is open to him to attend whatever courses he prefers, and in every other respect, he enjoys entire freedom of action. His expense of lodging varies from seventy-five shillings to fifteen pounds per annum, and he may dine at one of the first hotels for forty-five shillings, or at an inferior one for nine or twelve shillings a month. In the articles of dress, amusement, &c. he is in every sense his own master. Though it cannot be denied that this state of perfect independence, both as concerns his studies and his leisure, has occasioned many a youth's undoing, experience has shewn, that it is the only sure means of rousing great intellectual endowments, and forming men of eminent learning.

Though there are few states in Germany which do not possess their own universities, Leipzig has always maintained a foremost rank among them,

and has been a kind of nursery for nearly all her contemporaries; indeed, the great majority and the most eminent of teachers in other high schools have received their first education within her walls, whilst, in spite of the increase in the number of those schools, she has mustered never less than twelve, and frequently more than fifteen hundred, students.

Parents of affluence, who are anxious for the welfare of their children, are in the habit of providing them, when at the University, with tutors, who direct their studies, attend them in the lecture room, make them recapitulate what they have heard, watch over their conduct, regulate the occupations of their leisure, and control their expenditure. Such as are incapable of encountering such an expense, procure board and lodging for their sons, either with some married professor or in a respectable family, where the morals of their children may be properly attended to.

There are several learned societies, not only connected with the University, but, to a certain extent, conducted under its superintendence, their members consisting chiefly of the lettered class; amongst these are the Societies of Technology, Agriculture, Antiquities, Philology, Natural History, Homilectics, &c. Besides individuals studying at our University, these associations admit land-proprietors, merchants, artists, and other well-educated persons as ordinary members, and individuals, living in foreign parts, as honorary members. They are eminently useful, by means of the essays read at their sittings, in spreading the knowledge of any novel observations or discoveries made in the respective departments of art or science, to which they are severally devoted, as well as in furthering, generally, the advancement of the useful and liberal arts.

Leipzig is richly supplied with all the resources which the students can desire. It is the metropolis of the book-trade in Germany; and the museum and libraries of the university, the corporations, the professors, and other learned persons, are thrown open for the use of the students.

Three years are deemed the shortest period within which a young man, who enters the university with competent scholastic acquirements, can complete a proper course of study. The student, if at the end of this period he should feel himself duly prepared, puts his name down on the list for examination, previously to which he must produce proofs that he has uninterruptedly attended the leading prælections in the faculty into which he seeks admittance, for a space of three years; besides this, the law student is required to compose certain essays, and to declare, upon oath, that they are wholly of his own composition. Those who successfully pass through this ordeal become entitled to the subsequent advantages. If a Theologian, he can be appointed to the ministry or to masterships in schools. If a Jurisconsult, he may fill the station of an Advocate or a Vice-Actuarius in a legal court. If a Medical student, he may establish himself as a medical practitioner in any part of the country.

The individual who feels no inclination to enter upon active practical duties after completing his studies, but prefers the station of a mere man of letters, and seeks promotion in his faculty, is required to defend a thesis in the public hall, from which time he becomes a private teacher: hence the superabundant members of this class.

At an expense of from 9*l.* to 12*l.*, and after passing an examination before the faculty of philosophy, the degrees of Doctor in Philosophy and Master of Arts may be obtained; a similar examination is requisite in the other three faculties, wherein the Doctor's degree may then be obtained upon the payment of a sum, varying from 30*l.* to 60*l.*, according to circumstances, on which it would be tedious to dwell in this place. The fees derived from examinations and promotions

belong to the ancient professors of each faculty, and the Law professors enjoy handsome incomes from giving opinions in contested cases; as it is incumbent upon the courts, on all occasions where opinions are required, to lay the documents appertaining to the suit in question, before the faculty of jurisprudence.

The general incomes of the professors, dependent as they are upon casual receipts, and their popularity as lecturers, vary exceedingly, though none range beyond 1200*l.* per annum. Many of them add to their means by their talent as writers, or as editors of learned works.

A. L. H.

THE DRAMA.

King's Theatre.

PERHAPS no opera has been so long and so generally considered as a model in its kind as Cimarosa's 'Matrimonio Segreto.' It has given rules to the theorist from the day of its first representation; and it is appealed to and quoted by those who have learning in these matters, more frequently than even the masterpieces of Mozart. Those who have seen it on the Continent, know well the effect with which it is invariably performed; for when the Rosinian dogstar was raging at the full in the tropical district immediately beneath its influence, there was nothing unseasonable in the different lustre of Cimarosa, whose sweetness endured, and was welcomed with an undying enthusiasm. 'Il Matrimonio Segreto' has not been produced on our stage for many years; we had, therefore, a natural anxiety to know of what kind might be its reception; and for our own gratification, there was no composition we so longed to hear, especially under the good auspices with which it would be now presented to us. This wish we expressed some months ago, but with little idea that it would be gratified. However, there appeared at intervals, at different concerts during the season, some of the choice beauties of the Opera in a detached form; and had we understood the rules of astronomical prophecy, we might have known that these were rays shot from the chief luminary to announce its coming.

One would suppose that the characters of this opera could not be more strongly cast than they are. Zucchelli might appear an admirable Geronimo, the sisters Sontag his daughters to the life, Galli and Donzelli very appropriate in the parts of Il Conte and Paolino, and Madame Malibran, having universal talent, might be only too good for Fidalma. But this promise is not entirely realized. Firstly, Signor Zucchelli is rather tame compared with what he was in Don Magnifico, and compared with what the Buffo Comico is expected to be; then Henriette and Nina should (if there be truth in baptismal registers) have their parts reversed; Signor Donzelli gives a cumbrous character to the music, which is quite foreign to it, and Madame Malibran commits an error in judgment when she thinks it necessary to fill out the personification of an elderly lady by palsy and disguising her voice. Signor Galli, strange to say, is the only one of whom we have nothing to complain; the reason perhaps is, that he is the one from whom we had so little to expect. Count Robinson is not likely to find a better representative in the *secondo* of any theatre, and Signor Galli is not likely to find any other part in which he can be so effective. As for the fault attributed to Madame Malibran, we are disposed to dwell upon it, because it is rather characteristic of her, and because it is in itself dangerous, and might in its consequences do injury to the whole fabric of operatic performances. Why need the sister of Geronimo be so very much older than himself—why should she not be as many years younger? and then, even if the performer were as tender, as Madame Malibran is, of the scenic truth, there would be no necessity for

the quavering voice and tottering limbs, which, without question, interfere with the due effect of the music. The age of Fidalma is left at the mercy of the performer, and Madame Malibran makes her a sexagenarian to give scope for her own powers of acting such a part. But if she were two hundred years old, we should still object to her being allowed to show any decrepitude of voice, any shrillness or quaintness of intonation, that serves to prop an immaterial illusion, by the sacrifice of almost every thing which makes an opera worth hearing. No analogy is to be drawn from male characters; for though age and absurdity are frequently given to the Buffo, yet never to the *Buffo cantante*. Enough of that. As for Donzelli, the defect is in the quality of his voice, which is undoubtedly too heavy and sustained for the effervescent and sylphlike music of Cimarosa. And, with regard to Mademoiselle Sontag and her sister, willingly will we take them as they are, rather than lose one tittle of the sweetness and perfect beauty of our present Carolina.

The Opera has been represented twice. On both nights the house has been crowded in the extreme, and the success of the performance most marked and rapturous. This was not undeserved, for the novelty of style in the music itself, and great excellence in the performers (notwithstanding our words of exception) could scarcely fail to delight the most fastidious. Some of the more familiar pieces met with an applause which we never heard exceeded; in particular, the comic duet, 'Se fiato in corpo avete,' between Galli and Zucchelli, which, despite its length, had to encounter an irresistible encore. The beautiful terzetto, 'Le faccio un' inchino,' which has been previously rehearsed at various concerts and *par excellence* at that given by Mademoiselle Sontag last week, when Madame Pisoni and Mademoiselle Blais were the substitutes for Madame Malibran and Mademoiselle Nina Sontag. This, and the merry quartetto, 'Tu mi dici che del conte,' were almost equally applauded. The amusing finale to the first act was, if any thing, too quiet; the old gentleman was a good deal tantalized to be sure, but unless there is great spirit and cleverness in the confusion of persons collected around him, the repetition of his deafness and their bawling, becomes monotonous. The females seemed afraid of soiling their gloves, and the gentlemen were engrossed by what they had to sing, so that Geronimo escaped without the full measure of persecution which is generally dealt out to him. We cannot make the same complaint against the finale of the last act, in which the various voices were blended with the utmost possible harmony, and succeeded each other in that lovely *allegro*, 'Che trasporto d'allegria,' with just the proper variety of tone and similarity of expression. The musical world of England should be much indebted to Signor Donzelli for reviving this Opera on the occasion of his benefit, and to M. Laporte for allowing so much of the talent of his company to be concentrated in it. We have found fault with Madame Malibran, and now we would in some measure atone for it by expressing our unfeigned admiration of her conduct in undertaking a part usually assigned *Terza Donna*, and (according to her own conception) sustaining it with such ingenuity and effect, although labouring under the weakness consequent upon her late accident. We beg to observe that this tribute is paid, not from any fear of our being otherwise liable to the condemnation of an illustrious correspondent this week, whose vast abilities have become her champion, but in a free and honest spirit of merited admiration.

English Opera House.

THE liberal spirit of enterprise which has become a characteristic of the English Opera House, and its management, has been during the last week evinced in the production of an Opera, by Ferdi-

nand Ries, with all the costliness of decoration, fulness of orchestral and vocal strength, and general exactness and care which marked the importations of former years. To every one, the name of Ries is familiar as a bright, though not first-rate, luminary of the German school. His pianoforte compositions give a fair suggestion of his capabilities for grander efforts. He has the learning, the expression, the brilliancy of his sect. He has imbibed what could be imbibed by study, according to the best rules, and genius has thrown its radiance here and there over his more ordinary attributes. Still there is little grandeur, or depth of tenderness, or feeling; little, if any, simplicity; and every where too much colouring for the subject. The performance, then, of 'The Robber's Bride' was clearly an experiment, and an experiment whose success in England could never be very rapturous; but if not rapturous, it has not been equivocal. For the audience on each representation have accompanied the music in its progress, without languor, though perhaps with some slight effort. As to our judgment, we know not for the future, but we cannot be very sanguine that this opera will furnish many favorites to our list, or be attended to with much readiness of satisfaction, unless curiosity or conscience go some way in the matter. That the music is fine, need not be doubted; the concerted pieces amply show the composer's talent; and when we are familiar with the airs, there may then possibly be traced in them the richness of the ore which at present seems so overlaid and encumbered. But we will hear it often before we pronounce very certainly upon its deserts.

The story is of no great consequence, and most of our readers will have perused it by this time in the daily journals. The vocal exertions of the company were very successful. For besides the mere customary names of Phillips, Thorne, &c. we have Mr. Sapio after an absence of three years, and though his tenor compass scarcely extends far enough for the music of his part, yet the main body of it is sweet and expressive as ever. Miss Betts is improved and improving; and yet she wants something which will never be supplied: we must be content with only a measurable quantity of pleasure as derived from her. She can never carry the hearer beyond himself; her powers will never be absorbing. The fact is, that her voice, though musical, true, and flexible, is without pathos, without gentleness, almost without any power of mere expression. And beyond this, we fear that her intellectual and organic faculties are greatly disproportioned, and that she cannot even meditate the sweet mischief of which music should be capable.

Mr. H. Phillips, our favorite of the English school, sings an air in the third act with remarkable vigour and precision: and the Robber's chorus at the opening of the act is singularly spirited. But the chorusses here are always good, or appear so by contrast; for, certainly, no where else are they conducted with such boldness and skill.

On Monday night a musical interlude was produced at this theatre under the title of 'Incog: What's in a name?' The principal characters were sustained by Messrs. Wood, Keeley, Wrench, Russell, Benson, Hill, and by Mrs. Keeley and Miss Cawse. The songs thrown into it were selected from all quarters,—"Gioviette," "Che fate l'amore," "May thy lot in life be happy," &c. &c., being among the number. There were plots more than two, tricks, expedients, and puns without end. The audience were the most good-humoured we ever witnessed, and the piece met with the most entire and deserved damnation.

M. MENDELSON.

We omitted to make mention of the excellent concert given by Madlle. Sontag last week, for the benefit of the sufferers from the inundation in Silesia. Our silence was not voluntary, inasmuch as we received from the performance a pleasure which had

not been equalled in any previous concert of the season, and which we were prepared to express, but the graver matters of the week shut out our notes of admiration. All that can now be permitted, are a few words in praise of a most extraordinary man, whose name we have not hitherto presented to our readers, and whose appearance there was one of the grand features of the concert. We allude to M. Mendelssohn, a piano-forte player of almost transcendent talent, which becomes more admirable when something of the man is known. He is very young, apparently not more than twenty-two years of age, independent in station, his father being an opulent banker at Leipsic; and with a thirst and love of music nearly unparalleled, his modesty blinds him to the success with which he has cultivated it. After reading the 'Midsummer's Night Dream,' he composed that spirited overture of the same title, and in it has represented, not feebly, the emotions and anger which the pencil of the drama left in his mind. He is now gone to the Irish lakes, and it is expected that he will employ them as a subject for some future exercise of his skill in composition. As a performer, his abilities are quite first-rate. In the act of playing he is lost to every thing besides the instrument before him; and, indeed, in the most ordinary affairs of life, this musical enthusiasm is always present, and directs his thoughts and actions into one universal channel. His memory is represented as being the most wonderful of his faculties. After playing through one of Beethoven's most intricate symphonies, he can close the book and repeat it accurately by rote. Mayerbeer, like himself, studies the science as an amateur. Caraffa also is a prince of some petty state, but we believe his nobility of blood has not shielded him from poverty. From M. Mendelssohn the musical world has much to expect hereafter.

ENGRAVINGS.

Prospectus and Specimen of the Gardens and Menagerie of the Zoological Society. Hailes. London, 1829.

The specimen wood-cuts which accompany this Prospectus, are truly beautiful, and, if the work which it is intended to introduce to notice, be executed throughout in the style promised by these preparations, it will be one of the most delightful and elegant productions of the kind ever published. The vignettes also are charming.

National Portrait Gallery of illustrious and eminent Personages of the Nineteenth Century, Engraved on Steel, with Memoirs, by the Rev. Henry Stebbing. Nos. I. II. III. Fisher, Son, and Co.; Colnaghi and Son, &c.

A VERY little reflection on the effect which the exciting occurrences of the last half century have had in calling forth the energies of individuals, and affording them a field for the exercise of their several qualities will satisfy our readers of the interest necessarily attached to a publication of this kind. This persuasion will be confirmed by the mention of the names of Wellington, St. Vincent, Byron, and Wollaston, as among the nine illustrious personages whose portraits occur in the numbers already published of the 'National Portrait Gallery.' The engravings are in the dotted manner, by esteemed artists. They are all most respectably executed. Those of the Duke of Wellington, by Wolnoth, from a portrait by Sir Thomas Lawrence; Lord Amherst, by Freeman, from a picture, by the same artist; and the Marchioness of Stafford, by Freeman, from a portrait, by Phillips, are perhaps the prints which display the greatest uniformity of skill. But the head of Dr. Wollaston, by Thomson, from a picture, by Jackson, is the most effective and animated plate in the three numbers. Mr. Robinson has improved on the original portrait of Lord Byron, from the pencil of Westall, by sinking a shade or two of petit-maitre affectation.

The memoirs are slight and short, and confined to

a sketch of the most memorable occurrences in the life of each person. They are, however, all that the occasion requires.

NEW MUSIC.

No. 7. *Divertimento, 'The Legends of Switzerland,' as performed by the Author on the Apollonicon, arranged for the Piano Forte, and respectfully inscribed to Miss Frances Drake, by John Purkis.* Mahew and Co.

THIS publication presents a melange of favourite Swiss tunes, amalgamated into a pleasing fantasia, of a familiar and teachable nature. The following well known melodies are introduced:—"The Ranz-des-vaches," "The Chimes of Zurich," "The Swiss Peasant Boy," "The Tyrolean Peasant's Song," and "The Swiss Hunter's welcome home."

'Oh tell not of Love.' *A favourite Air in the celebrated Opera 'The Interrupted Sacrifice,' composed and arranged with Accompaniments, for the Piano Forte, by Peter Von Winter, the Poetry by J. H. Ewer and Co.*

THE favourite Andante in A, 2-4, adapted to new English language of a trifling description. The brilliant and striking style of Rossini's music (and that of his imitators) has so eclipsed the compositions of his predecessors, that they appear tame and spiritless; thus, Winter's music (although sound and good) now appears to lose its interest.

No. 3. 'Di piacer mi balza il cor,' from Rossini's admired Opera 'La Gassa Ladra,' arranged for the Flute, with an accompaniment for the Piano Forte, by Bernard Lee. Mahew and Co.

THIS is as pleasing and well arranged as the other two effusions of Mr. Lee's (noticed in the 'Athenæum,' Nos. 79 and 85.) The Piano Forte part is merely an accompaniment, thus the work is to be considered a Flute Solo, and not at all a Concertante Duet, for the two instruments. This gay, striking, and sparkling gem of Rossini's (although transposed from its original key of E, into the more familiar one of C,) loses none of its interest by this adaption, none of its spirit evaporates, as is too generally the case in transposition and translation.

TELFORD'S SYSTEM OF ROAD-MAKING.

ACCORDING to Mr. Telford's experience, as appears from his Report to the Commissioners for the improvement of the road from London to Holyhead, the most advantageous mode of constructing a road is to form a strong bottoming of stone pavement, over which the broken material should be laid; but where stone cannot be procured at a moderate expense, Mr. Telford recommends a bottoming of Parker's cement and gravel, with a coat of Hartshill stone laid on it. He caused an experiment to be made of this plan, along a quarter of a mile, at the northern extremity of the road to the Highgate archway; in order to ascertain what would be the comparative effect of using the same stone on the old surface of the road, he had a large quantity of it laid on between the arch and the Holloway road. The result was, that between the months of October and March last, full four inches of the stone on the old road between the arch and the Holloway road was worn away, where eight inches had been laid on, while not one inch was worn down where it was laid on the cement bottoming. Mr. Telford recommends that, at a future period, and by degrees, the middle of the road, all along the whole line to Holyhead, shall be constructed of the solid and perfect bottoming which he has found to answer so well; for the present, however, he thinks the money that can be furnished is better employed in giving the road the greater solidity of which it is capable by the ordi-

nary means. Mr. Telford says that it is proved, by experience, that there are no grounds for a common notion, that when materials are laid on a rough pavement they are soon crushed by the wheels of carriages; when the body of materials is six inches thick, he asserts that no such effect is produced by the wheels. On the contrary, the surface materials, by being on a dry bed and not mixed with the subsoil, become perfectly fastened together in a solid mass, and receive no other injury by carriages passing over them than the mere perpendicular pressure of the wheels, whereas, when the materials lie on earth, the earth that necessarily mixes with them is affected by wet and frost, the mass is always more or less loose, and the passing of carriages produces motion among all the pieces of stones, which causing their rubbing together, wears them on all sides, thence the more rapid decay of them when thus laid on earth, than when laid on a bottoming of rough stone pavement. The road made after Mr. Telford's plan proves economical in the end, on account of the rare necessity for repairs; the expense of scraping and removing the drift is not only diminished; but with Hartshill stone Guernsey granite, or other material equally hard, is nearly avoided altogether.

MISCELLANIES.

THE MENAI BRIDGE.—From the last report of the commissioners of the Holyhead Road it appears that the total amount of the tolls received from the opening of the Menai Bridge, on the 31st of January, 1826, to the 5th of April, 1829, was 3278*l.* 16*s.* 10*d.* The per contra account states the application of this sum as follows: expense of collection of tolls, 283*l.* 18*s.* 11*d.*; expense of painting and repairing bridge, 554*l.* 6*s.* 2*d.*; purchase of stock in the names of Trustees, applicable to future repairs of the bridge, 1083*l.* 6*s.* 8*d.*; amount paid into the Exchequer, 846*l.* 14*s.* 9*d.*; balance in hand, 508*l.* 10*s.* 4*d.*, total 3278*l.* 16*s.* 10*d.* The total amount of tolls received, at the Conway Bridge from the opening, in June 1826, to the 5th of April, 1829, was 1,174*l.* 7*s.* 5*d.*, accounted for as follows: expense of collecting tolls, 100*l.* 6*s.*; expense of painting and repairing bridge, 227*l.* 10*s.* 9*d.*; purchase of Stock in names of Trustees, 350*l.*; amount paid into the Exchequer, 261*l.* 18*s.*; balance in hand, 234*l.* 12*s.* 7*d.*; total, 1174*l.* 7*s.* 5*d.* The sums paid into the Exchequer in the year ending the 5th of January, 1829, from additional postage on letters towards the repayment of loans advanced for the building of the Menai and Conway Bridges were, for the Menai Bridge, 6,392*l.* 10*s.* 6*d.*, for the Conway Bridge, 957*l.* 9*s.* 4*d.* Total sum paid up to the same date for Menai Bridge, 43,577*l.* 1*s.*; for Conway ditto, 12,193*l.* 0*s.* 11*d.*

NEW MUSEUM AT BERLIN.—In aid of the subscription raising for the sufferers by the late inundations in Silesia, the new Museum erecting at Berlin, although yet unfinished, was opened to the public on the Sundays during the month of May, by order of the Minister of the Interior. The price of admission was one franc, the tickets to be procured during the week. This Museum, it would appear, is a very splendid building; among the rooms most worthy of remark, are noticed the Vestibule, ornamented with eighteen Corinthian columns, its walls to be decorated with painting in Fresco; a Rotunda seventy-five feet in height, lighted by a lantern twenty-three feet in diameter; two large halls for sculpture on the ground-floor, having each twelve columns of green porphyry and red-brown granite; and long picture galleries, the walls of which are hung with red flock paper, having a gilt border.

PAGANINI'S LESSON TO THE BERLIN MUSICIANS.—Paganini held his 'positively' last concert at Berlin on the 13th of May, when he availed himself of an opportunity to give a gentle lesson to the Royal Band, with which he before had frequent rea-

son to be displeased. On this occasion, the kettle-drums having gone wrong, he stepped up to the desk of the conductor and caused the piece to be gone over again, *da capo*, to the no small surprise of the audience, and the still greater astonishment of the orchestra. A singular instance of his presence of mind while playing, is spoken of as having occurred on the same evening. In the midst of one of the most difficult rondos, the E string broke, but he continued playing and performed the rest of the rondo on three strings. On a former night he had executed a composition of his own on two strings, and his remarkable performance with one string has been already noticed; so that during his sojourn at Berlin, the musical amateurs of that city had the gratification of hearing him play with one string; and with four, with three and with two strings.

NEWLY DISCOVERED PORTRAIT OF TENIERS.—The connoisseurs of the Netherlands, Native and English, have lately found a new object of interest in a picture of great value, a full-length portrait, the size of life, of the celebrated Teniers, painted by himself. It was discovered among the rubbish of the collection formerly belonging to the abbey of St. Tournay, in the published lists of which it was always mentioned as the work of Vandyck. The merit of its discovery, and of tracing its author, is due to the taste and perseverance of its present possessor, Captain Higgins, an Irish gentleman, residing in Flanders. The picture is now in Brussels, and is exciting the attention and admiration of all the amateurs in that capital.

RUSSIAN LAW OF THE PRESS.—The law of the press in Russia is much more lenient than it was under the late Emperor. The fifteenth section of the present law of the censorship, while it displays a degree of consideration in the actual government, gives a little insight into the nature of the interference that was practised under the former system. Its purport is as follows: The censors are not authorized to engage in inquiries as to the truth or falsehood of particular opinions, or conclusions of authors, when these do not contravene the general principles of censorship; they are not to concern themselves with opinions on the work itself, as to its being advantageous or disadvantageous, provided it be not pernicious as regards religion, the state, morals, and personal and individual character; they are not to alter or improve the style, or to point out the faults of authors in respect to points of literature, when the clear meaning of a phrase does not come within any prohibition on either of the four heads above mentioned. At the time that this regulation was promulgated, (in April, 1828) the law of copyright was also settled, and reserved to the representatives of an author for twenty-five years after his death, all property in his work.

PUBLICATION OF ENGLISH WORKS IN GERMANY.—A collection of English authors, for the gratification of the German admirers of English poetry, has been lately published at Frankfurt on the Maine, under the title of 'The British Poets of the Nineteenth Century, being a supplementary volume to the Poetical Works of Byron, Scott, and Moore.' The publication is in one volume, royal 8vo. and contains, besides an extensive selection from the poems of Southey, Barton, and others, the following fifteen entire works: 'Tales of the Hall' and 'Parish Register' of Crabbe; Wilson's 'Lale of Palms' and 'Miscellaneous Poems'; Coleridge's 'Sybille Leaves'; Rogers's 'Pleasures of Memory'; 'The Pleasures of Hope'; 'Gertrude of Wyoming'; 'Theodoric' of Campbell; the 'Improvisatrice'; 'Troubadour'; and 'Golden Violet', of Miss Landon; Montgomery's 'World before the Flood'; Hogg's 'Queen's Wake'; Barry Cornwall's 'Marcian Colonna'; and other poems; and Canning's Poetical Works. The 'Literary Gazette of Leipzig,' particularly recommends this book on the score of its cheapness. Although well printed, and containing nearly eighty thousand lines in one volume, it is to be purchased for less than half the

price which would have to be paid in London for any single production contained in the volume, not only of Crabbe or Wordsworth, but of Miss Landon.

COMPARATIVE STATISTICS.—Monsieur Balbi, in his 'Essay on the Statistics of Russia,' gives the following comparisons of the commerce of that country and France and Great Britain. The shipping of Russia he estimates at 3,594 vessels, or 303,516 tons; that of France, 85,241 vessels, or 3,165,000 tons; that of Great Britain, 129,526 sail, or 11,014,000 tons. The following is his distribution of the population of the principal European Powers after their residence and occupations. Those who reside in towns, he states to be, in every hundred, in Great Britain, more than 50; in France, about 33, in the Prussian States more than 27, in the Austrian empire nearly 23, in Russia, somewhat more than 12. The proportion in every hundred engaged in trade and agriculture respectively, he reckons to be, in Great Britain, in trade and manufactures 45, in agriculture 34; in France, in the former 36, in the latter 45; in the Prussian dominions, in trade, &c. 18, in agriculture 66; in Austria, in trade, &c. 9, in agriculture 69; in Russia, in trade, &c. 6, in agriculture 79.

POPULATION OF TURKEY.—De Cirlacy, in his 'Theatre of War in Turkey in Europe' gives, as the result of careful inquiries, the following classification of the inhabitants of the Grand Signor's European dominions:

Turks	2,000,000
Greeks and Albanians	5,000,000
Servians	1,800,000
Bulgarians	1,500,000
Moldavians and Wallachians ...	1,500,000
	9,800,000

This return exhibits nearly eight millions of Christians held in abject bondage by one fifth part of the total population!

PRIMARY EDUCATION IN THE UNITED STATES.—In the year 1815, the number of children who received primary instruction throughout the districts of the United States which had sent in lists of their scholars, was 140,106, bearing a proportion of 4 to 5, to the children between the ages of 5 and 15, in the same districts. The sum expended by government towards this education was 55,721 dollars. Since that period education has been rapidly increasing, and in the year 1828, the number of children admitted in the same districts, amounted to 468,205; the number of the children between the ages of 5 and 15, in the districts furnishing that amount, being 449,113, which gives a proportion of 25 to 24 in favour of the former. The expense incurred by the state in the same year, amounted to 232,343.

PUBLIC EDUCATION IN MOLDAVIA.—A grand ceremony took place at Jassy, on the 4th of March, in commemoration of the re-establishment of the Gymnasium in that city. This institution was founded by Basilide II, towards the middle of the 17th century, and was furnished by him with a library and printing office, but it was soon suppressed by the arbitrary jealousy of the Greek clergy; and it is only by tradition that it is known that the building was converted into a warehouse. The events of 1821, however, seemed to open a prospect of regaining for the inhabitants of Moldavia the advantages of so useful an establishment; and after the conclusion of the treaty of Ackerman, on the application of the conductors of the National School, it was again called into existence by the Prince Sturdza in a formal document. It has been open for the youth of Moldavia since the beginning of 1828, and is already as flourishing as during the life of its founder.

EDUCATION IN RUSSIA.—The Emperor has appointed a commission, under the presidency of the minister of public instruction, to examine all the old scholastic regulations, and from such of these as practise and experience shall have approved, to gather with any others which the different kinds of instruction may appear to require, to form a set of

complete regulations for every branch of public education. This commission has already promulgated rules which have been ratified by the Emperor for the direction of gymnasia, and district and parish schools within the University circuits of Petersburg, Moscow, Kharkow, and Kasan. A new Gymnasium has been ordered to be established in St. Petersburg, which, with the gymnasium previously existing, and the conversion of the high school into a gymnasium, makes three of those establishments in the capital. In Moscow, two new gymnasia are to be formed, so that there may be three of them in that city as well as in St. Petersburg. In Kharkow, in addition to the school formerly existing, there are to be two new ones. Kasan is to have a new gymnasium in addition to that previously established by the modification into an establishment of that kind, of the existing chief school. Each of the four Siberian provinces is to have its proper gymnasiums: with this view, a new establishment of that kind is to be instituted at Krasnojarsk, for the Jenisseiskisch department.

LITERARY INTELLIGENCE.

THE author of 'The Revolt of the 19th century' is about to publish 'Hambleton in the Nineteenth Century; or Colloquies on the Errors and Improvements of Society.'

BOOKS PUBLISHED DURING THE WEEK.

A Week at Christmas, 12mo., 3s. 6d.
Key to the Bible, in Questions and Answers, 12mo., 6s.
Short Notes on the Four Gospels, 12mo., 4s. 6d.
Emancipation, by Mrs. Sherwood, 2s.
Williams's Auction Laws, by King, 12mo., 7s.
Morning and Evening Prayers, 8vo.
An Analysis of the Second Decade of Livy, by Frederick Russell, 8vo., 5s. 6d.
Good's Lectures on our Lord's Sermon on the Mount, 8vo., 14s.
Beck's Medical Jurisprudence, 8vo., 18s.

Nights and mornings generally rainy. Nights rainy toward the end of the week. Thunder on Tuesday, Thursday, and Saturday.

Mean temperature of the week, 67.5.

Mean atmospheric pressure, 29.51.

Highest temperature at noon, 77°.

Astronomical Observations.

Saturn and Venus in conj. on Monday, at 5 h.
Mercury stationary on Thursday.
The Moon in Perigee on Saturday.
Venus's geocentric longitude on Sunday, 89° 44' in Leo.
Mars's ditto ditto 6° 20' in Leo.
Jupiter's ditto ditto 5° 42' in Sagitt.
Sun's ditto ditto 26° 27' in Cancer.
Length of day on Sunday, 16 h. 58 m. Decreased 36 m.
No real night.
Sun's hourly motion on Sunday, 2' 29" plus. Logarithmic sum of distances, .00029.

This day is published, with plates, post 8vo., 15s.
THE JOURNAL of a NATURALIST.
Second edition.
John Murray, Albemarle-street.

This day is published, price 7s. in boards,
THE BROADSTONE OF HONOUR. Book the First.—GODEFRIDUS.
London: published for Joseph Booker, 61, New Bond-street; where may be had also.
The Second, Third, and Fourth Books, viz., MORUS, TANCREDUS, and ORLANDUS.

FRENCH LANGUAGE.
This day is published, price 2s. the twenty-first Edition of
A NEW and EASY METHOD OF LEARNING the SPELLING and PRONUNCIATION of the FRENCH LANGUAGE. By JOHN PERRIN, carefully revised by C. GROS.
Printed for Harding and Lepard; Longman, Rees, Orme, Brown, and Green; Baldwin and Cradock; T. Boosey and Sons; Harst, Chance, and Co.; Harvey and Darton; Dulau and Co.; Harris and Son; Simpkin and Marshall; Souter; Baker and Fletcher; and Poole and Edwards; of whom may be had the new edition of
DR. MAVOR'S ETON LATIN GRAMMAR, with the Accents and Quantity marked, by Dr. Carey, price 2s. 6d.

MAVOR'S ETON LATIN GRAMMAR, WITH THE ACCENTS AND QUANTITY MARKED.
This day is published, price 2s. 6d., a new and greatly improved edition, being the XIIIth., of
DR. MAVOR'S ETON LATIN GRAMMAR; with Explanatory Notes, and useful additions to assist the learner. This edition has been most carefully revised, and the Accents and Quantity marked, by Dr. CAREY.

The sale of twelve very large editions, within a few years, is the best evidence of the value and estimation in which the notes of Dr. Mavor are held; and the patronage so liberally given, has induced the proprietors to spare no expense in rendering this edition in every way worthy of their support.
London: printed for Harding and Lepard; Longman, Rees, Orme, Brown and Green; Baldwin and Cradock; Whittaker; Treacher and Arnott; J. Richardson; T. Boosey and Sons; Simpkin and Marshall; J. Duncan; Hamilton, Adams, and Co.; E. Williams; Harvey and Darton; Poole and Edwards; Baker and Fletcher; Harst, Chance, and Co.; Cowie and Co.; Sastance and Streeter; J. Collins, and C. J. G. and F. Rivington.
Of whom may be had,
PERRIN'S FRENCH SPELLING, the twenty-first edition. Edited by C. Gros. Price 2s.

A NEW SCHOOL BOOK, SUITABLE TO ALL CLASSES.
This day is published, in a clear bold type on fine paper, and handsomely printed, 12mo. price 4s. 6d. neatly bound.

GUY'S GENERAL SCHOOL QUESTION BOOK; in which each question, in a regular series, is followed by its appropriate answer, not only in Ancient and Modern History, in which the whole is arranged in chronological order, but also in Biography, Geography, Astronomy, Heathen Mythology, Classical Phraseology, and a great and interesting variety of miscellaneous subjects; the whole tending to enlarge the boundaries of Juvenile Knowledge, by increasing its stores; and thus, by blending such a course of general information with sound classical or liberal learning, to raise a better superstructure of School Education. By JOSEPH GUY, formerly of the Royal Military College, and Author of a Chart of General History, Pocket Cyclopædia, School Geography, Elements of Astronomy, British Spelling Book, &c. &c.
London: printed for Baldwin and Cradock.

This work has been compiled by the author with unusual care and attention to the wants of Teachers. His long and successful practice in the education of youth must always give his books a decided preference over the generality of School Treatises, had they no other merit; but Mr. Guy's school books possess higher claims; they are more perfect in arrangement, more choice in selection, and more classical in style than any of the elementary works that have preceded them. Their extensive sale is proof enough of their value perhaps; but large as it is, the publishers doubt not but every year will add greatly to their circulation; at present the annual sale of the whole is not short of SIXTY THOUSAND! and when the 'GENERAL SCHOOL QUESTION BOOK' has taken its station (where it soon will be) in every respectable school in the empire, the total sale of these admirable School Books must be greatly increased. Teachers will see in this (Mr. Guy's latest and most finished work,) his intimate knowledge of the wants of schools; and in the arrangement, the power he possesses of abridging the anxious labours of school teachers.

COLOSSEUM, REGENT'S PARK.—The Proprietors of this magnificent EXHIBITION, invite the attention of the Public to the
NEW ARRANGEMENT OF ADMISSION.
To view the stupendous Panorama of London, from the principal Galleries,—the original Ball removed from St. Paul's Cathedral,—the Prospect from the summit of the Building,—and the Saloon for the reception of Works of Art
To view the Panorama only
To view the Conservatories, Fountain, and Swiss Cottage
Children, half-price.—Open from 10 till 8.

COUNTY HISTORIES.

Publishing by I. T. Hinton, 4, Warwick-square,
A NEW and COMPLETE HISTORY of the COUNTIES OF SURREY and SUSSEX, forming the ancient Saxon Kingdom of South Sax, from the earliest period of authentic record to the present time; including Notices of every Object of Topographical, Antiquarian, or Commercial Interest; from actual survey, by THOMAS ALLEN, author of the History of the Palace and Parish of Lambeth, the Histories of the City of London, County of York, &c. Illustrated by upwards of One Hundred Views, from Drawings by Nathaniel Whittock, engraved on steel by H. Rolis, W. J. Cooke, Rogers, Shury, Lambert, Winkles, &c.
This Work will be printed in octavo, on paper of the best quality, and will be completed in about Twenty Parts, price 3s. each. Each Part will contain Six Views and Seven y-two pages of Letter-press.
A Royal Edition, on fine thick paper, with Proof Impressions of the Plates, on India paper, will also be published, price 6s. each Part.

Dedicated to his Grace the Archbishop of York,
This day is published, Vol. 1., price 12s. in cloth, with Twenty-three Plates, of
A NEW and COMPLETE HISTORY of the COUNTY OF YORK, from the earliest period to the present time; comprising every object of Topographical, Geological, or Historical Interest; with all the Modern Improvements connected with Architecture, Manufactures, and Commerce; the Cathedral, Collegiate, and principal Parochial Churches; Seats of the Nobility and Gentry; British, Roman, and Saxon Antiquities, &c., from actual survey, by THOMAS ALLEN, author of the History of Lambeth, History of London, &c. Illustrated by One Hundred Views, from Drawings taken on the spot by Nathaniel Whittock, engraved on steel by W. J. Cooke, H. Rolis, Rogers, Lambert, Shury, Winkles, &c.

This Work is printed in octavo, on paper of the best quality, and will be completed in about Twenty Parts, price 3s. each. Each Part contains Six Views, and Ninety-six pages of Letter-press.
A Quarto Edition, on fine thick paper, with Proof Impressions of the Plates, on India paper, is also published, price 6s. each Part.

IMPROVED TERRO-METALLIC TEETH.

MR. HOWARD, 52, Fleet-street, (removed from 33,) having brought to perfection an important improvement in TERRO-METALLIC TEETH, respectfully solicits the attention of the Nobility and Gentry to his new method, which he is confident will be found on investigation to be far superior in natural appearance and durability to any ever before produced in England. They perfectly restore the articulation and mastication, and are not to be distinguished in any respect from the original teeth.—52, Fleet-street. At home from 10 till 4.

TERRO-METALLIC TEETH.

MR. A. JONES, Surgeon-Dentist to his Royal Highness the Duke of Orleans, 43, New Bond Street, begs to acquaint the Nobility and Gentry, that, from many years' intense application, he has invented and brought to perfection, a New System of Fixing TERRO-METALLIC, NATURAL, and ARTIFICIAL TEETH, from one to a complete Set, which are so accurately fitted as not to be distinguished from the original, and answer all the purposes of mastication, articulation, &c.—Mr. A. J. continues stopping decayed teeth with his unrivalled Anodyne Cement, which in one minute allays the most excruciating pain; and by this means carious teeth are wholly preserved and rendered useful, even if broken close to the gums. This being a metallic composition, it becomes hard as enamel in a few minutes, will not decompose with the heat of the stomach, and resists the effects of acids, atmospheric air, &c.—Cleaning, and every operation incidental to Dental Surgery.—At home from ten till five.

London: Printed and Published every Wednesday Morning, by F. C. WESTLEY, 165, Strand, opposite Newcastle-street.

LONDON, WEDNESDAY, JULY 29, 1829.

Price 8d.

EDUCATION OF LAWYERS.

MANY voluminous attacks have been made in some of the papers on the benchers of the Inner Temple, because they have determined to institute an examination for the junior members of the Inn over which they preside. Now, in the name of common sense, we would ask, what is a college but a place of education? And how can its conductors be blamed for attempting to make it in reality what it has never ceased to be in theory?

Oh! but public opinion compels a lawyer to learn all that is necessary, or refuses to give him employment. Good heavens, will the public never learn that they are a stupid and ignorant monster—as despicable as Bottom and not one half so amusing? The public are a congregation of people, each of whom knows something of his own trade, but among whom, when collected together, the ignorance of the majority will always predominate. The public can judge, no doubt, of the price and quality of bacon or calico; but what do they know of law, what of education? We are told that they will never employ an ignorant barrister; and that the certainty of this is sufficient to make legal students industrious. Sufficient, no doubt it is, and always will be, to make them diligent readers of whatever is meanest and most worthless in their science;—sufficient to make them Old Bailey brawlers;—sufficient incitement to be the lacqueys of attorneys;—sufficient encouragement to despise whatever is large or generous in law;—to become lovers of quibbles and sophisms, haters of general truths and broad principles, the most wretched, dead, and rotten, of God's creatures,—boisterous, lying, sneering, money-making lawyers.

Can this really be the purposes of our friends to freedom and liberality? Can they actually wish that lawyers should continue to be machines and tradesmen; bad machines, dishonest tradesmen? Why, what is their stock complaint against the English system, but that it gives power to those who have none other than the most petty and miserable views? And how should they have any other? What guide or purpose of their studies is there, but public opinion? And what will, what can, it ever aim at, but the production of serviceable ignorance and rascality, like its own? And yet, when it is attempted to make something of thought and general culture necessary to the station of a barrister, a yelp like that of all the hounds of Scylla, is excited in the very journals where the lawyers are commonly and most justly reprobated.

What is it that most commonly distinguishes the English barrister? Is it not a peculiar and unexampled narrowness and darkness of intellect, an incapacity for conceiving any thought not presented to him in the form of legal precedent, an utter indifference to high and stern principle, a pitiable disregard of every thing which does not seem likely to produce a fee? And how would a man of sense begin to remedy this degradation of the legal character? The remedy cannot come from public opinion. Turn your eyes to that most melancholy spectacle,—see that person in a wig and gown, with an eye hardened, sharpened, and deadened; a forehead of boundless audacity and monkey-like contraction; and lips which never uttered one generous thought that was not calculated to influence a jury, or let one truth escape, which had not been inserted in the brief by an attorney: that mockery

and shame of human nature represents, though not what every lawyer is, yet what public opinion tends to make him. That is the natural offspring of the power to which our philosophers look for legal reform. How would you counteract this evil influence? how introduce into the education of lawyers something stronger and larger than is given at a special pleader's office, or acquired by the example of the courts? Are there any conceivable means of doing this, but by compelling a different kind of education, and requiring from the candidate for the bar a knowledge of that ancient literature in which he will find that some things are beautiful and some true, besides the pages of reports; of those languages, which even the practice of English pleaders could scarcely divest (were they to attempt it) of all the traces of their divine origin, of all their fitness for the expression of human thought and feeling. Make him know that studies may have a value of their own, though they cannot be immediately productive of money; go on, if you can, to teach him a little of the universal principles and general history of the science which he is now instructed to learn as a trade, and you may possibly succeed in rendering him somewhat better than a blot in educated society and a curse to the community.

We confess that we had previously but little hope of seeing any change so beneficial as that which would produce in our lawyers some general cultivation of mind. We feared that, though it might be practicable to improve the qualifications of the clergyman and the physician, the barrister was for ever given up to his own devices. The bar is a 'blatant beast,' which roars directly to the crowd, and is answered by them, and we dreaded that no other power would ever venture to interfere between these high and mighty allies. We are happy to know that (from whatever cause) we were mistaken; and we trust that no alarm at the foolish clamour of some letter-writers in the newspapers will induce the benchers to give way. The gentlemen who speak with so much horror of the intended examination in Greek and Latin, are probably distressed at the prospect of being themselves compelled to labour in recovering the forgotten lore of their boyhood.

We are, moreover, anxious that the authorities of the Inner Temple may not be led to consult public (that is mob) opinion as to the nature of the trial which the neophytes of their profession are to undergo. The vulgar cry will always be in favour of what the vulgar are pleased to denominate useful, in opposition to grounded and scientific education. People, to be sure, do not converse in Greek, nor carve at a dinner-table according to Euclid. But what society requires from us, we have all of us sufficient inducement to learn; and there is no reason for fearing that what is necessary in business, or agreeable in the world, will ever be generally neglected. The difficulty is in prevailing on men to study knowledges, and cultivate powers of no immediate, popular, outward, advantage. It is the business of a wise education to cherish energies and produce habits which, though they do not enable us to gain money or vulgar applause, are sources of inward strength, happiness, and self-reliance. The ancient languages are, above all, precious as enlivening, fostering, and disciplining the mind; and we rejoiced with exceeding joy to hear that an acquaintance with them would be required from the students. We have only to hope that the benchers will not stop short in their reform;

that they will demand a high, rather than a low, qualification; and that they will be imitated by the ruling powers at the other inns of court.

The members of the English bar may be assured that only in this way, only by a rise in the general level of their acquirements and accomplishments will their profession hold the rank in the world of thought, and have the liberal influence over their countrymen, which their ample honours and unbounded wealth can never give them, but to which they might seem to be entitled by the importance of their function. Of all European jurisdictions the English is the most ignorant of the principles and history of general law, and knows his own in the narrowest and most meagre method. He is the least adorned with literature; the least capable of perceiving the connection between the laws of a country and its character and history; and their connection with the human mind and with social politics. To a French lawyer it is a title of honour to be not only acquainted with literature, but profoundly versed in history, or philosophy, or any other branch of thought. To an English lawyer, a similar reputation is an impediment and hindrance. It proves that he is not the very tradesman whom the judges delight to honour, the attorneys to fee, and the public to admire. To a German lawyer, a knowledge of the laws of the chief nations of the world, is a matter of first necessity. The English barrister, who should employ his time in storing up and mastering this kind of learning, would be considered as lost to his profession, and would be lamented over by his friends as if he had become a Trappist or a Bedlamite. Why should this be the case? It is possible that the modern practice of the bar has frittered away into details the lore which in other countries may be most easily obtained in its principles, and has thus made it necessary for a barrister to devote to his peculiar study; the whole of that time which elsewhere suffices for the attainment of knowledge at once more deeply grounded and more extensive. But wherefore should this have happened, if our lawyers had not been devoid of that cultivation of mind and scientific spirit which would enable them to look methodically at the laws they have to administer.

When the education of lawyers is rightly attended to and enforced, they will become a great and learned corporation, worthy to know, to deliver, to maintain, and to improve the jurisprudence of England, and well able to set at defiance both the codifier and the antiquarian; both him who reveres what is dead of the past, and him who follows a phantasmal future. It is immeasurably important to this and to every country that its knowledge, its laws, and its religion, should not be left to float at the will of a capricious and ignorant multitude, but should have some permanent form and professional supporters. But if these are themselves taken from the crowd and distinguished by their dedication to a particular purpose, without losing any thing of the narrowness and triviality of vulgar opinion, they become but licensed clogs and stumbling blocks to the national mind, instead of being its champions, guardians, and promoters.

We have reformers among us who would remedy the evil by throwing every thing open and loose to the casual winds; who would leave all that ought to be kept permanent, and superior to the fluctuations of

tuations of the hour, at the wil of the multitudinous and heterogeneous monster, the many. We trust that there are also others, who would rather be wise in time, and improve and strengthen institutions which will necessarily be swept away if they are not ameliorated. It seems to us strange indeed, that establishments such as the Inns of Court, should be held to exceed their duty in requiring from the members of a learned profession another qualification than the achievement of eating a certain number of dinnes in a public hall. Let them consider themselves as designed to extend and complete the school and college education, to found the legal knowledge of the students in a basis of general culture, and to raise up for the dispensation of justice aid the support of our national polity, a body of men more deeply learned than our loud rhetoricians, and more largely wise than our masters of rick and precedent and juridical handicraft.

The deficiency of books at the Inns of Court is (as some one has recently observed) a disgrace to the niggardliness of the wealthy bodies that ought to have provided them; and the attendance on the law lectures at the London University is a reproach to their supineness.

THE LOVES OF THE POETS.

The Loves of the Poets. By the Author of 'The Diary of an Ennuyée.' 2 vols. 8vo. Colburn. London, 1829.

A book on this subject might be a very good one. The way to make a good book, however, is not the way in which the business of book-making is commonly undertaken. The usual mode of doing this is to find some matter made up of many parts, each connected to the others by some obvious link, and then to write about the different portions, as if they were entirely separate. The mode in which a subject should be contemplated, if it were wished to treat it satisfactorily, would be very different. A person writing with this view would look for the root and vital principle, and trace up the life-giving sap through every fibre and ramification. We fear that this is not the fashion in which the author of 'Loves of the Poets,' has regarded the business that lay before her.

She appears to us not to have seen that there is any thing in the mind of a poet different from the minds of common men; and nothing, as far as we can judge, distinguishes their love in her eyes from that of common men, but the circumstance of its having been recorded in verse. Now, this is certainly a mistake; and it is one which pervades the whole work before us. Another error is, it seems, to us the almost necessary result of the sex of the writer. No female has ever given a good dissertation on any of the passions; for those which a woman has experienced she feels too strongly to be able to analyse them, and those which she has never felt, from a defect of imagination, she can hardly conceive.

Hence it comes that, in writings by or for women, we scarcely ever find a just representation of any other than quiet feelings. When a female mind attempts to master, and exhibit, passion, it generally makes some little momentary fragment of human experience a standard and law of the whole. We are thus placed in a world of false vehemence and fantastic ecstasy, and are presented with some coarse extravaganzas of a few emotions, instead of the vast intertexture and innumerable complications of actual nature.

The writer of the 'Loves of the Poets' says that Madame de Stael is the only person who would have been equal to the subject. We are not surprised that a woman of sensibility and talent should think so; but it certainly seems to us that she is mistaken. Madame de Stael was a great rhetorician, but she was not a poet or a philosopher; and no one but a poet or a philosopher

could adequately treat of the 'Loves of the Poets.' The lady who has now treated of them is neither the one nor the other; and her book is very different from what we could have wished it to be.

It shows, however, a diligent reading of much poetry, and abundant reverence for poets. It contains a great number of chalky sketches, accompanied by mottoes from a hundred different volumes, and surrounded by a running pattern of gay and various, though not very significant arabesque.

We quote a portion of an essay on 'Dante and Beatrice,' which we think will interest our readers.

'Dante and his Beatrice are best exhibited in contrast to Petrarch and Laura. Petrarch was in his youth an amiable and accomplished courtier, whose ambition was to cultivate the hearts, and please the fair. Dante early plunged into the factions which distracted his native city, was of a stern commanding temper, mingling study with action. Petrarch loved with all the vivacity of his temper; he took a pleasure in publishing, in exaggerating, in embellishing his passion in the eyes of the world. Dante, capable of strong and enthusiastic tenderness, and early concentrating all the affections of his heart on one object, sought no sympathy; and solemnly tells us of himself, in contradistinction to those poets of his time who wrote of love from fashion or fancy, not from feeling,—that he wrote as love inspired, and as his heart dictated.

"Io mi son un che, quando
Amore spirà, noto, ed in quel modo
Ch'el detta dentro, vo significando."

Purgatorio, c. 24.

'A coquette would have triumphed in such a captive as Petrarch; and in truth, Laura seems to have "sounded him from the top to the bottom of his compass;"—a tender and impassioned woman would repose on such a heart as Dante's, even as his Beatrice did. Petrarch had a gay and captivating exterior; his complexion was fair, with sparkling blue eyes and a ready smile. He is very amusing on the subject of his own coxembry, and tells us how cautiously he used to turn the corner of a street, lest the wind should disorder the elaborate curls of his fine hair! Dante, too, was in his youth eminently handsome, but in a style of beauty which was characteristic of his mind: his eyes were large and intensely black, his nose aquiline, his complexion of a dark olive, his hair and beard very much curled, his step slow and measured, and the habitual expression of his countenance grave, with a tinge of melancholy abstraction. When Petrarch walked along the streets of Avignon, the women smiled, and said, "there goes the lover of Laura!" The impression which Dante left on those who beheld him, was far different. In allusion to his own personal appearance, he used to relate an incident that once occurred to him. When years of persecution and exile had added to the natural sternness of his countenance, the deep lines left by grief, and the brooding spirit of vengeance, he happened to be at Verona, where since the publication of the *Inferno*, he was well known. Passing one day by a portico, where several women were seated, one of them whispered, with a look of awe,—"Do you see that man? that is he who goes down to hell whenever he pleases, and brings us back tidings of the sinners below!" "Ay, indeed!" replied her companion,—"very likely; see how his face is scarred with fire and brimstone, and blackened with smoke, and how his hair and beard have been singed and curled in the flames!"

'Dante had not, however, this forbidding appearance when he won the young heart of Beatrice Portinari. They first met at a banquet given by her father, Folco de' Portinari, when Dante was only nine years old, and Beatrice a year younger. His childish attachment, as he tells us himself, commenced from that hour; it became a passion, which increased with his years, and did not perish even with its object.'

'In one of his canzoni, called "Il Ritratto," (the Portrait), Dante has left us a most minute and finished picture of his Beatrice, "which," says Mr. Carey, "might well supply a painter with a far more exalted idea of female beauty, than he could form to himself from the celebrated Ode of Anacreon, on a similar subject." From this canzone and some lines scattered through his sonnets,

I shall sketch the person and character of Beatrice. She was not in form like the slender, fragile-looking Laura, but on a larger scale of loveliness, tall and of a commanding figure;—graceful in her gait as a peacock, upright as a crane,

'Soava a guisa va di un bel pavone,
Diritta sopra se, come una grua.

'Her hair was fair and curling,
"Capegli crespi e biondi,"

but not golden,—an epithet I do not find once applied to it: she had an ample forehead, "spaciosa fronte," a mouth that when it smiled surpassed all things in sweetness; so that her Poet would give the universe to hear it pronounce a kind "yes."

'Mira che quando ride
Passa ben di dolcezza ogni altra cosa.
Così di quella bocca il pensier mio
Mi aprona, perchè io
Non ho nel mondo cosa che non deasse
A tal ch' un sì, con buon voler dicesse.

'Her neck was white and slender, springing gracefully from the bust—

'Poi guarda la sua svelta e bianca gola
Compressa ben dalle spalle e dal petto.

'A small, round, dimpled chin,

'Mento tondo, fesso e picciolletto:
and thereupon the Poet breaks out into a rapture, any thing but theological,

'Il bel diletto

Aver quel collo fra le braccia stretto

E far in quella gola un picciol segno!

'Her arms were beautiful and round; her hand soft, white, and polished;

'La bianca mano morbida e pulita:

her fingers slender, and decorated with jewelled rings as became her birth; fair she was as a pearl;

'Con un color angelica di perla:

graceful and lovely to look upon, but disdainful where it was becoming:

'Graviosa a vederla,
E disdegnosa dove si conviene.'

'The love of Dante for his Beatrice partook of the purity, tenderness, and elevated character of her who inspired it, and was also stamped with that stern and melancholy abstraction, that disposition to mysticism, which were such strong features in the character of her lover. He does not break out into fond and effeminate complaints, he does not sigh to the winds, nor swell the fountain with his tears; his legs does not, like Petrarch's, alternately freeze and burn him, nor is it "un dolce amaro," "a bitter sweet," with which his fancy can sport in good set terms. No; it shakes his whole being like an earthquake; it beats in every pulse and artery; it has dwelt in his heart till it has become a part of his life, or rather his life itself.* Though we are not told so expressly, it is impossible to doubt, on a consideration of all those passages and poems which relate to Beatrice, that his love was approved and returned, and that his character was understood and appreciated by a woman too generous, too noble-minded, to make him the sport of her vanity.—He complains, indeed, *poetically*, of her disdain, for which he excuses himself in another poem: "We know that the heavens shine on in eternal serenity, and that it is only our imperfect vision, and the rising vapours of the earth, that make the ever-beaming stars appear clouded at times to our eye." He expresses no fear of a rival in her affections; but the native jealousy as well as delicacy of his temper appears in those passages in which he addressed the eulogium of Beatrice to the Florentine ladies and her young companions.† Those of his own sex, as he assures us, were not worthy to listen to her praises; or must perforce have become enamoured of this picture of female excellence, the fear of which made a coward of him.—

'Ma tratterò del suo stato gentile
Donne e donzelle amorose, con lui;
Che non è cosa da parlarne altrui.'

* It borrows even the solemn language of Sacred Writ to express its intensity:

Nelle man vostre, o dolce donna mia!
Raccomando lo spirito che muore.

† I refer particularly to that sublime Canzone addressed to the ladies of Florence, and beginning "Donne ch' avete intelletto d'amore."

Among the young companions of Beatrice, Dante particularly distinguishes one, who appears to have been her chosen friend, and who, on account of her singular and blooming beauty, was called, at Florence, Primavera, (the spring). Her real name was Giovanna. Dante frequently names them together, and in particular in that exquisitely fanciful sonnet to his friend Guido Cavalcanti; where he addresses them by those familiar and endearing diminutives, so peculiarly Italian—

'E monna Vanna e Monna Bice poi.'

It appears from the 7th and 8th Sonnets of the Vita Nuova, that in the early part of their intercourse, Beatrice, indulging her girlish vivacity, smiled to see her lover utterly disconcerted in her presence, and pointed out her triumph to her companions. This offence seems to have deeply affected the proud, susceptible mind of Dante: it was under the influence of some such morose feeling, probably on this very occasion, that his dark passions burst forth in the bitter lines beginning,

'Io maledico il di eh' io vidi imprima
La luce de' vostri occhi traditori.'

"I cursed the day in which I first beheld the splendour of those traitor eyes," &c. This angry sonnet forms a fine characteristic contrast with that eloquent and impassioned effusion of Petrarch, in which he multiplies blessings on the day, the hour, the minute, the season, and the spot, in which he first beheld Laura—

'Benedetto sia l' giorno, e l' mese, e l' anno,' &c.

This fit of indignation was, however, short-lived. Every tender emotion of Dante's feeling heart seems to have been called forth when Beatrice lost her excellent father. Folco Portinari died in 1289; and the description we have of the inconsolable grief of Beatrice, and the sympathy of her young companions,—so poetically, so delicately touched by her lover,—impress us with a high idea both of her filial tenderness and the general amiability of her disposition, which rendered her thus beloved. In the 12th and 13th Sonnets, we have, perhaps, one of the most beautiful groups ever presented in poetry. Dante meets a company of young Florentine ladies, who were returning from paying Beatrice a visit of condolence on the death of her father. Their altered and dejected looks, their downcast eyes, and cheeks "colourless as marble," make his heart tremble within him; he asks after Beatrice—"our gentle lady," as he tenderly expresses it: the young girls raise their downcast eyes, and regard him with surprise. "Art thou he," they exclaim, "who hast so often sung to us the praises of our Beatrice? the voice, indeed is his; but, oh! how changed the aspect! Thou weepst!—why shouldst thou weep?—thou hast not seen her tears;—leave us to weep and return to our home, refusing comfort; for we, indeed, have heard her speak, and seen her dissolved in grief; so changed is her lovely face by sorrow, that to look upon her is enough to make one die at her feet for pity."

It should seem that the extreme affliction of Beatrice for the loss of her father, acting on a delicate constitution, hastened her own end, for she died within a few months afterwards, in her 24th year. In the "Vita Nuova" there is a fragment of a canzone, which breaks off at the end of the first strophe; and annexed to it is the following affecting note, originally in the handwriting of Dante.

"I was engaged in the composition of this Canzone, and had completed only the above stanza, when it pleased the God of justice to call unto himself this gentlest of human beings; that she might be glorified under the auspices of that blessed Queen, the Virgin Maria, whose name was ever held in especial reverence by my sainted Beatrice."

Boccaccio, who knew Dante personally, tells us, that on the death of Beatrice, he was so changed by affliction, that his best friends could scarcely recognise him. He scarcely eat or slept; he would not speak; he neglected his person, until he became "una cosa selvatica e vada," a savage thing to the eye: to borrow his own strong expression, he seems to have been "grief-strung to madness." To the first Canzone, written after the death of Beatrice, Dante has prefixed a note, in which he tells us, that after he had long wept in silence the loss of her he loved, he thought to give utterance to his sorrow in words; and to compose a Canzone, in which he should write (weeping as he wrote,) of the virtues of her who

through much anguish had bowed his soul to the earth. "Then," he says, "I thus began:—gli occhi dolenti,"—which are the first words of this Canzone. It is addressed, like the others, to her female companions, whom alone he thought worthy to listen to her praises, and whose gentle hearts could alone sympathise in his grief.

'Non vo parlare altrui'

'Se non a cor gentile, che 'n donna sia!'

On the anniversary of the death of Beatrice, Dante tells us that he was sitting alone, thinking upon her, and tracing, as he meditated, the figure of an angel on his tablets. Can any one doubt that this little incident, so natural and so affecting,—his thinking on his lost Beatrice, and by association sketching the figure of an angel, while his mind dwelt upon her removal to a brighter and better world,—must have been real? It gave rise to the 18th Sonnet of the Vita Nuova, which he calls "Il dolore annovale," (the mournful anniversary).

Another little circumstance, not less affecting, he has beautifully commemorated in two Sonnets which follow the one last mentioned. They are addressed to some kind and gentle creature, who from a window beheld Dante abandon himself, with fearful vehemence, to the agony of his feelings, when he believed no human eye was on him. "She turned pale," he says, "with compassion; her eyes filled with tears, as if she had loved me: then did I remember my noble-hearted Beatrice, for even thus she often looked upon me," &c. And he confesses that the grateful, yet mournful pleasure with which he met the pitying look of this fair being, excited remorse in his heart, that he should be able to derive pleasure from any thing.

Dante concludes the collection of his *Rime*, (his miscellaneous poems on the subject of his early love) with this remarkable note:—

"I beheld a marvellous vision, which has caused me to cease from writing in praise of my blessed Beatrice, until I can celebrate her more worthily; which that I may do, I devote my whole soul to study, as she knoweth well; in so much, that if it please the Great Disposer of all things to prolong my life for a few years upon this earth, I hope hereafter to sing of my Beatrice what never yet was said or sung of woman."

And in this transport of enthusiasm, Dante conceived the idea of his great poem, of which Beatrice was destined to be the heroine. It was to no Muse, called by fancy from her fabled heights, and feigned at the poet's will; it was not to ambition of fame, nor literary leisure seeking a vent for overflowing thoughts; nor to the wish to aggrandise himself, or to flatter the pride of a patron;—but to the inspiration of a young, beautiful, and noble-minded woman, we owe one of the grandest efforts of human genius. And never did it enter into the imagination of any lover, before or since, to raise so mighty, so vast, so enduring, so glorious a monument to the worth and charms of a mistress. Other poets were satisfied if they conferred on the object of their love an immortality on earth: Dante was not content till he had placed *his* on a throne in the Empyrean, above choirs of angels, in presence of the very fountain of glory; her brow wreathed with eternal beams, and clothed with the ineffable splendours of beatitude;—an apotheosis, compared to which, all others are earthly and poor indeed.

THE PERSIANS OF ÆSCHYLUS.

The Persians of Æschylus, Greek and English. By William Palin.

THIS translation is a work of great pretensions and no utility whatever; it would have been surprising indeed, to have found the least particle of merit attaching itself to such a tissue of presumption as that contained in the author's preface. We should scarcely have condescended to the exposure of such an imposture were it not that we are threatened with a complete series of the Greek tragedians, which the author says 'he designs to publish on the same plan, and in the laborious preparation of which he humbly hopes the reception of this volume will encourage him.' We know not what he means by 'laborious preparation,' possibly it might be so to him; but we are quite sure that any sixth-form boy in a public school, would accomplish

such a book as that before us in the out-of-school hours of one month; consequently what we have to expect of this book-projector is, an inundation of thirty and odd volumes like the present, in the course of a year or two. This is a serious matter both to the public and the author himself; and out of the duty we owe to the one, and a certain degree of compassion we entertain for the other, we think a few remarks on his production, and the probability of his success as a translator, may not be thrown away; particularly if we should be so lucky as to inspire him with a little diffidence of his own competency for the undertaking he proposes to himself.

The title page says this is a translation 'on a new plan from the text of Porson, as corrected by Dindorf, Blomfield, and Schutz; with copious English critical and explanatory notes, elucidating every difficulty of construction or allusion; also parallels and illustrations from the English Poets, and an engraved plan of the battle of Salamis. For the use of Senior Greek Students.' This, with a few extracts from the Preface, will shew the author's design; on which, and the execution of it, we will take the liberty to make a few remarks presently. 'His humble pretensions,' he says, 'are these:

"The Tragedies will be published *separately*, with the original Greek text on the opposite page,—a great advantage, it is presumed, both as to economy and convenience, to those who have not leisure for the whole series,—which every scholar of course wishes, though few but professional men can accomplish. Another advantage is, the translation will answer *line for line* to the original; by which means inverted and obscure constructions are simplified, and a multitude of explanatory notes superseded. But though strictly and invariably faithful, I have endeavoured (by advantages peculiar to my plan) to make it not altogether *inelegant*. Where, for instance, will be found the barbarisms of the Hamiltonian trash, and of certain other publications I could name?—publications not only of an illegitimate, repulsive, and useless nature, but positively injurious. To prove what can be effected in a strictly faithful translation, I beg to refer my reader to from .818 to 881 of this Tragedy, wherein I had the curiosity to make the experiment. He who requires greater assistance (if greater be possible) than is there given, is an absolute dunce, and for such I do not write. And, at the same time, I appeal to my reader, if he do not see there something like the *spirit* of the original?"

We fear to take the translator at his word and transcribe the passage in question, lest the 'spirit of the original' should indeed make its appearance, not in the translator's meagre and ragged travesty of English blank verse, but attired in his own mask and buskins, and looking fiercely indignant at such a profanation of his sacred remains; *ταυράδος βίβραν*, as Aristophanes describes him to have looked when provoked by Euripides in the judgment-hall of Pluto. He goes on—

'But as, in some cases, this is less practicable, and as my object is rather *utility* than elegance,—rather to enable the student thoroughly and speedily to understand the beauties of the *original* than to convey them in my translation,—he will perceive I have invariably submitted to sacrifice sound to sense, where the two (in a faithful translation of this kind) are incompatible, though it would have been much more agreeable to my own taste, and much *easier*, to have done otherwise. The mere English reader I still refer to the splendid (but rambling and often incorrect) translation of Archdeacon Potter. Nor do I wish it, with the student, to supersede *Lexicon and Grammar**; the lesson should be learned with, and said without, the translation,—which, used judiciously in this way, will, I feel convinced, enable him to learn more, and that more thoroughly and agreeably, in one hour, than he would otherwise in two. But I do not think, whatever Mr. Hamilton may, that any language can be learned without grammar, or without a very *steady* and *systematic* attention to grammar; an

* Stephens, Scapula, Hederic, or Jones; and Matthiæ or Valpy. Such works as Schreyvilius and the Eton Grammar are comparatively useless for an author of this description.

of quotation, we should probably apostrophize in the very appropriate words of the poet :

'Here's a large mouth indeed
That spits forth death and mountains rocks and seas;
Talks as familiarly of roaring lions
As maids of thirteen do of puppy dogs:
What cannoner begot this lusty blood?
He speaks plain cannon, fire, and smoke, and bounce;
He gives the bathmado with his tongue;
Our ears are call'd; not a word of his
But buffet better than a flat of France:
Zounds I was never so bethumped with words
Since first I called my brother's father dad.'

We trust, after what has been said, that Mr. Palin will give us credit for sincerity, when we advise him not to publish any more translations of Greek tragedies.

LIVES OF THE BRITISH PAINTERS.

Family Library, No. IV.—The Lives of the most Eminent British Painters, Sculptors, and Architects, by Allan Cunningham. 3 vols. 12mo. Vol. I. London, 1829. Murray.

(Second Notice; see p. 449.)

At the conclusion of our former notice of Mr. Cunningham's volume of 'Biography of British Painters,' we cautioned our readers against the supposition that the observations which we had taken that opportunity of making on public taste in matters of art, were intended to be applied to the author of the work which had suggested them; or that we considered him an enemy to the practice of historical art. We hinted, on the contrary, our belief that his views on the subject were of the most enlightened description; and we cannot, we think, do better on resuming our review, than commence with giving a proof of the justice of the notion we had formed of Mr. Cunningham's general ideas, by citing a passage from his work, in which his opinion is explicitly and broadly stated. Our satisfaction in making this quotation is the greater, as while we are doing justice to the author by assisting in giving publicity to his sentiments, we feel that we do the greatest possible benefit to the cause of which we are sincere, and would be more efficient advocates, by bringing to its aid a supporter, the spirit and eloquence of whose language we should emulate in vain. The passage we allude to is elicited by the notice of the paradoxical attempt of Hogarth to maintain the claims to preference of comedy above tragedy—of the familiar in art above the sublime; it is as follows:

'Those who are not satisfied with the accuracy of Hogarth's notions by his prints and his pictures have little chance of being overcome by the force of written arguments. I am afraid few will be disposed to rank comedy above tragedy, or common life higher than the heroic. The actions of lofty minds and the pursuits of inspired men, will always maintain a higher place in the estimation of mankind than the mere picturesque exploits of inferior characters. Entertainment and information are not all that the mind requires at the hand of the artist. We wish to be elevated by contemplating what is noble, to be warmed by the presence of the heroic, and charmed and made happy by the sight of purity and loveliness. We desire to share in the lofty movements of fine minds, to have communion with their images of what is god-like, and to take a part in the rapture of their love, and in the ecstasies of all their musings. This is the chief end of high poetry, of high painting, and of high sculpture; and that man misunderstands the true spirit of those arts, who seeks to deprive them of a portion of their divinity, and argues that information and entertainment constitute their highest aim.'

We recommend this passage to the serious contemplation of such of our readers as may have allowed the plausible arguments, which are urged in favour of what Mr. Cunningham calls the *literally natural* in art, to induce them to conclude that history and poetry are beyond the sphere of painting. We recommend them to ponder well these sentiments of an author who is so far from despising comedy in

art as to become, and very justly in our opinion, the eulogist of Hogarth rather than of Reynolds. We conjure them to consider his expressions maturely, and by the sincere adoption of them to contribute, as far as in them lies, to justify him in ascribing his own just and noble sentiments, to the generality of his countrymen. In our own speculations on the state of taste as regards the arts in England, we have, indeed, occasionally indulged the hope that it is more the fault of our artists than of the public, that there exists no British school of painting worthy of the name; and that the predilection too generally shown for productions of a humble, and even of a low, nature is to be attributed rather to the want of a corresponding excellence in performances of higher character, than to any absence of taste or of feeling for the elevated in the public. Facts, however, strong and irrefragable, oppose themselves to this conclusion; and the history of Wilson, as contained in the volume before us, is a fatal instance of the failure of real merit to meet its just appreciation. It is on this account, and in the hope that the narrative may operate as a warning to our readers how they incautiously join in the popular or fashionable cry of the day, that the following select specimens of Mr. Cunningham's performance from his biographical sketch of this eminent and classical painter, so unfortunate and neglected in his life-time, so happy in the name that has lived after him.

'The love of landscape-painting spread very slowly—so slow, that, after the sale of a few of his works among the more distinguished of the lovers of art, he could not find a market for the fruits of his study—and had the mortification of exhibiting pictures of unrivalled beauty before the eyes of his countrymen in vain. He soon began to feel that in relinquishing portrait-painting he had forsaken the way to wealth and fashionable distinction, and taken the road to certain want and unprofitable fame. The appeal which his original pursuit made to individual vanity was felt, and through it he had acquired a decent livelihood, which his present employment seemed to deny him. To paint the varied aspect of inanimate nature—to clothe the pastoral hills with flocks, to give wild fowl to the lakes, ring-doves to the woods, blossoms to the boughs, verdure to the earth, and sunshine to the sky, is to paint landscape it is true—but it is to paint it like a district-surveyor, instead of grouping its picturesque beauties, and inspiring them with what the skillful in art call the sentiment of the scene. Wilson had a poet's feeling and poet's eye, selected his scenes with judgment, and spread them out in beauty and in all the fresh luxury of nature. He did for landscape what Reynolds did for faces—with equal genius, but far different fortune. A fine scene, rendered still more lovely by the pencil of the artist, did not reward its flatterer with any of its productions either of oil, or corn, or cattle; as Kneller found dead men indifferent paymasters—so inanimate nature proved but a cold patroness to Wilson.

'It was the misfortune of Wilson to be unappreciated in his own day;—and he had the additional mortification of seeing works wholly unworthy of being ranked with his, admired by the public and purchased at large prices. The demand for the pictures of Barret was so great, that the income of that indifferent dauber rose to £2000 a-year; and the equally weak landscapes of Smith, of Chichester, were of high value in the market—at the time when the works of Wilson were neglected and disregarded, and the great artist himself was sinking, in the midst of the capital, under obscurity, indigence, and dejection. He was reduced, by this capricious ignorance of the wealthy and the titled, to work for the meanest of mankind. Hogarth, as we have seen, sold some of his plates for half-a-crown a pound weight—and Wilson painted his 'Ceyx and Alcyon' for a pot of beer and the remains of a Stilton cheese! His chief resource for subsistence was in the sordid liberality of pawnbrokers, to whose hands many of his finest works were consigned wet from the easel. One person, who had purchased many pictures from him, when urged by the unhappy artist to buy another, took him into his shop-garret, and, pointing to a pile of landscapes, said, "Why, look ye, Dick, you know I wish to oblige, but see! there are all the pictures I have paid you for these three years." To crown

his disappointments—in a contest for fame with Smith of Chichester—the Royal Society decided against Wilson.

'To account for the caprice of the public, or even for the imperfect taste of a Royal Society, is less difficult than to find a reason for the feelings of dislike, and even hostility, with which Wilson was regarded by Reynolds. We are told that the eminent landscape-painter, notwithstanding all the refinement and intelligence of his mind, was somewhat coarse and repulsive in his manners. He was indeed a lover of pleasant company, a drinker of ale and porter—one who loved boisterous mirth and rough humour: and such things are not always found in society which calls itself select. But what could the artist do? The man whose patrons are pawnbrokers instead of poets; whose works are paid in porter and cheese; whose pockets contain little copper and no gold; whose dress is coarse and his house ill-replenished; must seek such society as corresponds with his means and condition; he must be content to sit elsewhere than at a rich man's table covered with embossed plate. That the coarseness of his manners and the meanness of his appearance should give offence to the courtly Reynolds is not to be wondered at; that they were the cause of his hostility I cannot believe, though this has often been asserted. Their dislike was in fact mutual; and I fear it must be imputed to something like jealousy.

'In those moments of irritation and animosity, the cold, calm temper of Reynolds gave him a manifest advantage over an opponent irritable by nature, and soured and stung by disappointment and misfortune. The coarse and unskilful vehemence of poor Richard was no match for the cautious malignity of the president, who enjoyed the double advantage of lowering his adversary's talents in social conversation, and *ex cathedra* in his Discourses. Reynolds seems to have been a master in that courtly and malevolent art ascribed by Pope to Addison, of teaching others to sneer without sneering himself, and "damning with faint praise." As a specimen, I transcribe the following passage from one of the president's discourses:

'Our ingenious academician, Wilson, has, I fear, been guilty, like many of his predecessors, of introducing gods and goddesses, ideal beings, into scenes which were by no means prepared to receive such personages. His landscapes were in reality too near common nature to admit supernatural objects. In consequence of this mistake in a very admirable picture of a storm which I have seen of his hand, many figures were introduced in the foreground, some in apparent distress, and some struck dead, as a spectator would naturally suppose, by the lightning, had not the painter injudiciously, as I think, rather chosen that their death should be imputed to a little Apollo who appears in the sky with his bent bow, and that these figures should be considered as the children of Niobe. The first idea that presents itself is that of wonder in seeing a figure in so uncommon a situation as that in which the Apollo is placed, for the clouds on which he kneels have not the appearance of being able to support him.'

'This criticism was uttered, indeed, when Wilson was in the grave, and when it could not hurt him personally; it nevertheless proves the insinuating nature of the critic's hostility; and that long and rooted dislike had made him shut his eyes on excellencies to which he could not otherwise have been insensible.'—pp. 191-195.

It is truly painful to have to reflect on such an instance of human weakness as is exhibited in these petty criticisms from a man who could so well afford to do justice to a contemporary artist as Reynolds. May the contemplation of it and of its consequences have their due effect! The work of Wilson and the malignant comments of Reynolds have both survived; the one to verify the prediction of its author, that the productions of his pencil would be sought for after his death; to adorn the National Gallery of the country, in which half a century previously his paintings were wholly neglected; and to excite the undisputed admiration of posterity: the others to elucidate the true character, to the destruction of the fame, of their pronouncer. Nor is this the only instance of the petty malice of Reynolds towards an artist whose now acknowledged merit leaves no doubt that envy or the dread of superiority was the motive which incited those attempts at depreciation.

'It is related that, at a meeting of the members of the Academy on a social occasion, Reynolds proposed the health of Gainsborough as *the best landscape-painter*; on which Wilson added aloud, *and the best portraits-painter* too. The president pretended not to have been aware of the presence of Wilson, and made a courtly explanation. Wilson, who received the apology with a kind of dissatisfied growl, was afterwards accused by his companions of wanting a proper spirit of conciliation—by which, said they, he might have profited, for the president could endure to be flattered, and was kind to those who submitted to his ascendancy. Reynolds had never experienced any reverse of fortune—the applause of the world was with him, and much of its money in his pocket; he might therefore have afforded to be indulgent to a man of genius suffering under the want of honour, and even the want of bread.

'Nor was the president of the Academy the only person who distressed him with injurious opinions. A certain coterie of men, skilful in the mystery of good painting, came to the conclusion, that the works of Wilson were deficient in the gayer graces of style, and sent Penny, an academician whom Barry worshipped as one of the chief painters on earth, to remonstrate with the artist, and inform him, that, if he hoped for fame or their good opinion, he must imitate the lighter style of Zucarelli. Wilson was bustled on one of his works when this courier from the Committee of Taste announced himself and delivered his message. He heard him in silence—preceeded with his labours—then stooped suddenly, and poured forth a torrent of contemptuous words—which incensed the whole coterie, and induced them to withdraw any little protection which their opinion had extended over him.

'As the fortune of Wilson declined, his temper became touched; he grew peevish, and in conversation his language assumed a tone of sharpness and acidity which accorded ill with his warm and benevolent heart. Some men are raised to stations where the meanness of their nature shows but the more deformed and repulsive by the contrast; while others, originally of amiable character, soured by neglect, and stung by undeserved insult, forget by degrees dignity in despair, and allow their minds to become as squalid as their dress.

'Wilson had, nevertheless, spirit enough at all times to resent impertinence. When Zoffani, in his satiric picture of the Royal Academy, represented him with a pot of porter at his elbow, he instantly selected, like Johnson on an occasion little dissimilar, a proper stout stick, and vowed he would give the caricaturist a satisfactory thrashing. All who knew Wilson made sure he would keep his word; but Zoffani prudently passed his brush over the offensive part, and so escaped the cudgelling. On one occasion Jones, a favourite pupil, invited him to see a large landscape which he had painted; he looked, and exclaimed, "How, Mr. Jones, what have you been doing? you have stolen my temple!" "Is it too dark, sir?" said Jones. "Oh, black enough of all consequence!" answered the other, and instantly retired.

'He was fond of the company of Sir William Beechey, and at his house he frequently reposed from the cares of the world and the persecution of fortune. He was abstemious at his meals, rarely touching wine or ardent spirits; his favourite beverage was a pot of porter and a toast; and he would accept that when he refused all other things. This was a luxury of which he was determined to have the full enjoyment; he took a moderate draught, sat silent a little while, then drank again, and all the time eyed the quart vessel with a satisfaction which sparkled in his eyes. The first time that Wilson was invited to dine with Beechey, he replied to the request by saying, "You have daughters, Mr. Beechey, do they draw? All young ladies draw now." "No, sir," answered his prudent entertainer, "my daughters are musical." He was pleased to hear this, and accepted the invitation. Such was the blunt honesty of his nature, that when drawings were shown him which he disliked, he disdained or was unable to give a courtly answer, and made many of the students his enemies. Reynolds had the sagacity to escape from such difficulties by looking at the drawings and saying "pretty, pretty," which vanity invariably explained into a compliment.

'His process of painting was simple; his colours were few, he used but one brush, and worked standing. He

prepared his palette, made a few touches, then retired to the window to refresh his eye with natural light, and returned in a few minutes and resumed his labours. Beechey called on him one day, and found him at work; he seized his visitor hastily by the arm, hurried him to the remotest corner of the room, and said, "There, look at my landscape; this is where you should view a painting if you wish to examine it with your eyes, and not with your nose." He was then an old man, his sight was failing, his touch was unsure, and he painted somewhat coarsely, but the effect was wonderful. He too, like Reynolds, had his secrets of colour, and his mystery of the true principle in painting, which he refused to explain, saying, "They are like those of nature, and are to be sought for and found in my performances." Of his own future fame he spoke seldom, for he was a modest man, but when he did speak of it, he used expressions which the world has since sanctioned. "Beechey," he said, "you will live to see great prices given for my pictures, when those of Barret will not fetch one farthing."

'The salary of librarian rescued him from utter starvation; indeed, so few were his wants, so simple his fare, and so moderate his appetite, that he found it, little as it was, nearly enough. He had as he grew old become more neglectful of his person; as fortune forsook him he left a fine house for one inferior—a fashionable street for one cheap and obscure; he made sketches for half-a-crown, and expressed gratitude to one Paul Sanby for purchasing a number from him at a small advance of price. His last retreat in this wealthy city was a small room somewhere about Tottenham Court Road;—an easel and a brush, a chair and a table, a hard bed with few clothes, a scanty meal and the favourite pot of porter, were all that Wilson could call his own. A disgrace to an age which lavished its tens of thousands on mountebanks and projectors,—on Italian screamers, and men who made mouths at Shakespeare.

'It is reported that Reynolds relaxed his hostility at last—and, becoming generous when it was too late, obtained an order from a nobleman for two landscapes at a proper price. This kindness softened the severity of Wilson's animadversions on the president; but old age with its infirmities was come upon him; his sight was failing, his skill of touch was forsaking him; and his naturally high spirit had begun to yield at last to the repeated injuries of fortune. London was relieved from witnessing the melancholy close of his life. A small estate became his by the death of a brother; and, as if nature had designed to make some amends for the neglect of mankind, a profitable vein of lead was discovered on his ground. When this two-fold good fortune befel him, he waited on his steady friend, Sir William Beechey, to ask him if he had any commands for Wales. His spirits were then high, but appeared assuaged, for his health was visibly declining, and his faculties were impaired. He put his hands to each side, and pressing them, said, with a sorrowful smile, "Oh! these back settlements of mine!" He took an affecting farewell of Sir William and set out for his native place, where, far from the bitterness of professional rivalry, and placed above the reach of want, he looked to enjoy a few happy days.—pp. 196-200.

Notwithstanding the length to which our extracts have extended, we must not deny ourselves the gratification of quoting the following pleasing anecdote from the life of Gainsborough.

'One of his acquaintances in Bath was Wiltshire, the public carrier, a kind and worthy man, who loved Gainsborough, and admired his works. In one of his landscapes, he wished to introduce a horse, and as the carrier had a very handsome one, he requested the loan of it for a day or two, and named his purpose; his generous neighbour bridled it and saddled it, and sent it as a present. The painter was not a man to be outdone in acts of generosity; he painted the waggon and horses of his friend, put his whole family and himself into it, and sent it well-framed to Wiltshire, with his kind respects. It is considered a very capital performance. From 1761, when Gainsborough began to exhibit his paintings at the Academy, till his removal from Bath in 1774, Wiltshire was annually employed to carry his pictures to and from London; he took great care of them, and constantly refused to accept money, saying, "No—no—I admire painting

too much," and plunged his hands in his pocket to secure them against the temptation of the offered payment. Perceiving, however, that this was not acceptable to the proud artist—the honest carrier hit upon a scheme which pleased both. "When you think (said he) that I have carried to the value of a little painting, I beg you will let me have one, sir; and I shall be more than paid." In this coin the painter paid Wiltshire; and overpaid him. His son is still in possession of several of these pictures, and appreciates their value; many of Gainsborough's productions were not so worthily disposed of.—pp. 330-331.

We cannot take our leave of the first volume of this work without expressing our satisfaction at its appearance, and the gratification we anticipate from its successors. The life of Hogarth is evidently that which the author has written with especial delight, and we can honestly avow our conviction that there is no real admirer or lover of excellence in art, for no real lover or admirer of art is of exclusive taste, who will not concur in his views of the merit and talent of that exquisite satirist. The life of Reynolds is more startling; we fear it is not the less just on that account; but after all it might perhaps have been desired that the biographer might have discriminated with greater nicety between the duties of practice and those of teaching, and given Sir Joshua more credit, than he has done, for the judgment which dictated the admirable lectures. The doctrines these contain are not the less sound because their author wanted the power to put in practice the lessons he gave to others; and we apply the term, admirable, to his lectures, advisedly, regarding them as inculcating not the servile copying of the works of old masters, but the study of their style.

The wood-cuts which accompany this volume are most skilfully executed, but we think more is attempted in them than that branch of engraving is well capable of. The landscape of Wilson is almost the only one to which we should not object.

NEW SYSTEM OF ASTRONOMY.

Idees Nouvelles sur le Systeme Solaire. Par M. Le Chevalier J. Chabrier, Ancien Officier Supérieur, Correspondant de la Société d'Histoire Naturelle, &c. 4to. Paris.

M. CHABRIER is well known to naturalists, by his 'Essay upon the Flight of Insects' and his 'Observations upon the Mechanism of the Progressive Movements of Man and Vertebrated Animals'; but we think he would have done wisely to have confined himself to the motions of things more within his sphere of observation than the distant orbs of the firmament. He seems, indeed, like many other astronomers, to have given his imagination unwarranted scope, and to have fancied rather than reasoned. Besides, he is far too positive and dogmatical in matters of so doubtful a kind as the phenomena of astronomy, respecting which men who have been most skilled in the science have hesitated to express themselves decidedly, amidst conflicting opinions.

Astronomy, indeed, we fear, is regarded by many persons too much in the same light as geometry—as one of the certain sciences now established on unquestionable principles; though the most eminent astronomers have themselves viewed the matter very differently. Copernicus, for example, expressly declares that nobody could expect any thing certain from astronomy. Take, as an example of the uncertainty found in this science, the distance of the sun from the earth, which is set down in our school-books at ninety-five millions of miles. This distance is computed from what is called the annual parallax, concerning which Sir Isaac Newton remarks, that 'if it could be accurately obtained, we might be said to have arrived at a tolerable degree of certainty.' This parallax, however, is far from being established. The observations of the transit of Venus over the sun's disk, made the parallax 9"; Sir Isaac Newton made it 10"; Dr. Halley made it

12"; M. Cassini made it 44; and Mr. Whiston made it 32": and yet all these astronomers followed the same mode of computation. We shall give one other instance of astronomical discrepancy. The two best astronomers of the present age, Sir William Herschell and Professor Schoeter have both given calculations of the new planets; and though their methods were the same, the difference of the results is very remarkable. According to Herschell, the diameter of the planet Ceres is 160 miles; according to Schoeter, it is 1624 miles. The diameter of the planet Pallas is, according to Herschell, 80 miles; while Schoeter makes it not less than 2099. Now which, we ask, of these two eminent astronomers are we to believe?

These discrepant statements, however, it may be remarked, relate to facts of a very different kind from theoretical speculations respecting the cause of gravitation, which Newton himself scarcely made any attempt to solve, but which forms one of the prominent features of M. Chabrier's work. How far he has been successful in making out a plausible system will best appear from his own account, from which we shall here subjoin an extract:

'If the sky is formed by water, that liquid fills the planetary system, and presses with all its weight upon the atmosphere of the sun; it also surrounds the atmospheres of the planets, is put in motion by the sun, and carries the planets along with it in its course. It is also of a transparent nature, since the most distant stars are seen through it, and since it is penetrated by the sun's light, partially obscured by its blue rays.

'This supposition explains in a very probable manner the splendour and perpetuity of the sun's light, produced in part by the excessive pressure, exercised upon the atmosphere; the movements of rotation and translation of that luminous star; its continual action upon the planets; the tails of the comets; the cause of the light of these stars, and their irregular motions; the yellow light which surrounded the atmosphere of the comet of 1811; the zodiacal light produced by the same cause; the invariability of nebulae and stars; the origin of stars; the fixedness and elasticity of the planetary atmospheres, and at the same time the small density of these atmospheres, which would not be in proportion with the immense mass of liquid, which would press upon them if the diverging current of this liquid, flowing into them, was not put into motion and influenced by the centrifugal power; for in the supposition that the liquid which surrounds the stars were in an absolute state of repose, it is probable that the atmospheres of the planets would be so compressed by it as to be rendered luminous.

'It is then not very unlikely that if the planets have appeared in the form of comets in the converging current of the sidereal liquid, in which that liquid is moved by its tendency alone to equilibrium, or by the central force, the intensity of which progressively increases. It is not unlikely, I say, that their atmospheres, being strongly compressed, would produce light.

'I ask, if it be not more natural to suppose that the sun puts the planets in motion by some intermediate liquid, the existence and morbidity of which every thing announces, than to imagine these bodies in motion by virtue of a single impulsion in the universal void, which we have every reason to believe impossible? And how was this impulsion first created, and how are its effects perpetually supported, and whence comes these perfect bodies?

'How is it to be conceived that the nebulae of very irregular forms, such as were observed by Herschell, can exist in the void, can preserve their respective positions, enjoy an intestine motion, become by degrees spherical and luminous, acquire by that means a dense nucleus, and form eventually planetary bodies? We are no more able to conceive these things than it is possible for us to comprehend the existence of the moon without an atmosphere of her own, and placed beyond the limits of the earth's, the existence and elasticity of the latter in the void, and the progressive diminution of its density. We understand much better that the fundamental fluid of the atmosphere is everywhere almost equally dense, and that what is called rarification of the air at great heights above

the surface of the globe, is simply the rarification of oxygen.—P. vii.

Such is a brief *aperçu* of some of the singular ideas which M. Chabrier has deemed fit to designate a new solar system. The following appears no less novel, and to our obtuse judgments fanciful and improbable:

'The existence of a void or vacuum appears as inconceivable as the borders of the universe itself. There is in this hypothesis, and the isolation which is the consequence of it, something absolutely contrary to all the knowledge we possess; to all the notions which we entertain of nature and the existence of beings, their formation and increase, something in fact opposed to ideas of order and appearance.

'We observe, that in nature every thing undergoes change—every thing is renewed; the variety of the combinations is infinite; it is then contrary to our ideas to think that there exists beings of the first order isolated and destined, nevertheless, to have increase, and subsist eternally by themselves. According to such a supposition, the same matter would answer the same purposes without alteration and diminution, which is without example; for all combinations and, consequently, every idea of generation, increase, &c. must be rejected.

'From what we observe and know, it is much more difficult to render supportable an idea of the universal void, of which we are able to cite no example strong enough in this place for a comparison, than to conceive an absolute plenum, of which we are partially convinced, since we perceive it around us and in us under different forms; that we can imagine a part of it in motion by very natural means, and because all bodies which are organized and living on the surface of the earth, can only exist in their integrity in water or in air, the respirable portion of which appears to me to be only water, which has received a particular preparation fit for beings living upon the earth and for combustion.

'It is very probable then that the stars, which consume an enormous quantity of æriform fluids by combinations of every description, could not exist in the vacuum, repair their losses in it at every moment, and preserve their atmospheres in a state of elasticity; for we do not know of any aerial fluid which losing its buoyancy in consequence of its rarification, would be capable in that state, of containing and compressing the elastic fluid of the atmospheres; functions which, by the by, a fluid may discharge with advantage.

'If, for example, the sun were surrounded by a vacuum, he would have no influence upon any thing, nor would any thing have influence upon him; he would not in such a case receive the matter which produces heat and light matter, of which he must consume an immense portion, and which would soon be exhausted if it were received from his own substance: for we do not know of any light of such dazzling splendour which would result from a very active combustion.

'In the same manner, if the moon be situated beyond the atmosphere of the earth, and if she have no atmosphere in the midst of the vacuum, she would have no influence upon the earth; how could she attract or repel if she have no connection with objects?

'The existence of a universal vacuum then it is impossible to prove; it is a mere hypothesis: it is evident, however, that the permanency of light and heat cannot be explained by it, nor the attractive and repelling power of the sun, nor the perpetuity and regularity of the circular motions of the heavenly bodies.—P. 10.

Our readers, we imagine, will already think we have given them enough, and more than enough, of M. Chabrier.

OLDCOURT.

Oldcourt, a Novel. 3 vols. 8vo. London, 1829. Colburn.

THANK Heaven! the season of novel publishing, and consequently of novel reviewing, is nearly over. We are a-weary of narratives in three volumes, and long for nothing so earnestly as for that interminable appetite of youthful mantua-makers which Mr. Col-

burn and the Minerva Press together would find it impossible to satiate.

We do not know whether we shall be called to exercise our function on any other novels before the next winter. We hope not, for 'Oldcourt' would have been enough to disgust us with the whole class; we have seldom seen any thing with the same indication of talent, and yet on the whole so rambling and foolish. The personages are in general common place, and the dissertations portentously tedious, more especially that singular discourse in which the author attempts to shew that the Irish are not impudent. Yet there is a portrait of an Irish Peasant as natural and affecting as any we remember. It tempts us to give more than just importance to the book, and to quote a large portion of the narrative in which Conolly records his story. Our readers may be assured that in this extract they have the cream and flower of three dull volumes.

"So then, your honour, having every thing nate and comfortable, my little cow, and my pig, and my poultry, an the ould mother quite agreeable, I thought I might begin to think of slittin' in the world. So I casts about, and fixes my eye on a clane handy little girl, one Biddy Farrell, a neighbour's child. Sure your honour remembers Paddy Farrell, down at the grange, who used to catch hedgehogs for you, and help us to hunt the otters, along the mill-stream in the wood!"

'D'Arcy having answered the appeal to his recollection by an assenting nod, the narrator continued:

"I had often cast a sheep's eye on Biddy afore, and thought to myself, 'that's the little Colleen for my money;' and Biddy herself now and then gave me a sly glance, and would shake back her nice brown locks, and tie her cap more smart, when I used to overtake her on a Sunday, comin' from chapel; and it was always 'God save you, Biddy,' and 'God save you kindly, Billy Conolly,' bechune us.

"So, upon the strength of it, I makes up to Biddy in ra'al earnest, and sure enough, all went smack smooth with me, and I was scrapin' up the little pinny for the ring an' the priest, when a big rogue of a slaveen, the ould miller's man, who thought to knock a leg under me with Biddy, and was mad entirely, because she tould his ugly slut of a sister, she valied my little finger more nor his whole carcass—well, what does the invious spalpeen do, but goes to inform again' me as a Whiteboy, and for what, your honour? only just because I happened to go out one fine night with the boys, to lind a hand with a coat of paint, for the mangy hide of the hearth-money man, who tuck the bit of a bed from under ould Catty Doyle, the poor lone widow woman in the village.

"So there was I shut up till Sixes time, for three long months, with a parcel of thievin' rogues and vagabones, widout any sence of dacency to God or man; and after that condemned to six months more of the same good company. And sure if it wasn't for your honour, they'd have sint me on my thravels with a ring round my leg, but the ould bar'net said, you'd be mad at it, because I was your playfellow.

"Now all this, as a body might suppose, got the better of me entirely. At first I thried to keep myself to myself, and wou'd not mix at all, or make with the wicked imps that used to be a tazin' and plaguin' o' me, and roarin', and rattlin', and makin' their fun with death in their eye, and the devil at the door; but they left me no pace, and I was so down-hearted, thinkin' of Biddy, and the poor ould cratur of a mother, all alone with the pig, and the chickens, and nobody to spancel the cow, or dig up a dish of praties for her, that sure enough, God forgim me! I tuck to the whiskey just for comfort, now and then, whin the dhrop would be goin' round with the rakehellly devils about me.

"Now this, and more, was somehow all brought to Biddy, who cou'dn't abide a boy to be disguised or teased at all, at all, so that whin I came at last to get out of pound, she'd hardly spake, and looked quite crooked at me.

"The ould woman, too, was on her back in 'he faver, the cow driv for the rint, and the p that used to be so plump and lively, about the cabin, quite lank and jane-like. Oh! I was like one crazy. Howsoever, I stirred my stumps a bit, and made after the brownie just in time afore the cant, to replevy her out of the grip of

the agint. And the poor body of a mother, soon got on her legs again too, sitting quite aisy, on her boss in the chimney corner; and as nobody cou'd say black was the white o' my eye, havin' never done an ill turn to man or mortal, barrin' the bit of a frake wi' the vagabone hearth-money man, which you know was nuts to the neighbours, I thought I'd clinch the business with Biddy; and as I promised to take my book oath again the native, for a twelvemonth and a day, I soon brought her to razin again.

"But as ill luck would have it, when all was plain sailin', and she had consinted to go with me to Father Cassidy the very next week, to be tied with the band that neither wears, nor breaks in this world, what should bewitch me but I must go to the fair with a frind, an' there I was tipped just to wet the whiale for the dust in my throat; whin, some how or other, so much of the native slipped down unknown't to me, that I got quite lovin'; and as I done nothin' for the honour of the darlin' that day, I spit in my fist, and twirlin' the saplin' I says, 'Who dare say pasc to purty Biddy Farrell?' But divil a one budged, for the boys all knew I was an ugly customer, with the dhrop in my eye, and the bit of shillelah in my hand; so, as nobody said nothin', I ups and gives a tap of the switch to a curly-poll spalpeen in the tupt, who looked as if he'd like to be saucy."

"For shame! Conolly," cried D'Arcy, now interposing, "I had no idee you were so quarrelsome."

"Is it me, your honour?" exclaimed Conolly, "me quarrelsome! the divil a bit; I was never contrary or cantenarious in my whole life; and by my sowl, nobody should say the word to me but your honour, for sure I was always for pace and quiet, unless whin Biddy was consarned, or my own faction called me to defend 'em."

"Well," said D'Arcy, "how did you adventure at the fair end?"

"Faith! then, your honour, that's the thing I can't very well tell; but as I was sayin', the little hint I give the boy that looked crooked at me, ruffled his timper a bit; and so we went to it kindly, an' my frind an' myself bein' rather handy with the tools, we kicked up a rumpus that tuck in the whole fair."

"What might be the upshot of the skrimmage, after myself was put to sleep, I won't purtind to tell your honour, because I never knew the rights of it exactly; but when I wakened out of the soundest snooze that ever sat murther to music, with nothin' but plaslin' dramas of fighin' an' fastin' an' shouts an' shillelah's, why, I found myself mighty queer and comical; an' openin' my eyes that seemed glued in my head, just to peep about a little, —what shou'd I see, but myself stretched out on a poor wad of straw bechune four naked walls, while every bone in my skin began akin' and painin' like mad, whenever I attempted to stir hand or foot."

"What! I suppose they had put you in prison for your pranks at the fair?" observed D'Arcy.

"Deed then, that you may say," continued Conolly; "but I couldn't make it out at all, an' began to think my drame was changed for the worse; but I was soon made sensible of it, for a black lookin' codger, with a big kay in his fist, an' a bit of a basket on his arm, comes into the place and says, 'Well! Well sir,' says I, 'what's the mather, an' who's so kind as to gi' me this good lodgin'?' 'I'm glad you like it,' says he, with a grin. 'By my sowl! sir,' says I, 'I don't like it at all, an' the sooner we lave it the better, for I'm very ill convenient in it.' 'O you are,' says he; 'I am,' says I; 'and the divil's cure to you,' says he, 'you popish varmint, I wish I had my will of you, an' I'd tache you to break a Protestant head that way again.'"

"Then setting down on the flure aside o' me, a platter of cold praties, with spring water sauce,—There, lap your allowance like a dog, as you are," says he, 'an' give no more tongue or I'll soon larn you to bark at your betthers.'"

"Now this was all mighty uncivil, but I was on the wrong side of the door, and on the broad o' my back, so think's I to myself, 'Patience Billy Conolly,' an' sure enough, it was'n't long before I got bravely again, an' could hardly keep my two hands off the ill lookin' thief that was always aggravatin' me with his clack."

"But by an' by who should come to let me out of my cage but the bar'net's man; and here your honour

did me good service again unknown't to yourself, for he tould me I might thank my stars that I was rocked in the same cradle with your honour, or they would have sint me clane out of the country."

"Well, Conolly," observed D'Arcy, "I am glad to have been of any service to you; but how did you contrive to spoil all again, and come to dandle a musket, as you express it?"

"Why, not to be troublin' your honour with a long story," rejoined Conolly, "you must know, that the frake at the fair settled my hash with Biddy entirely, an' she wouldn't spake or even look at the same side o' the way with me; and, indeed, small blame to her for it, while I carried the marks and tokens of my folly, with a phiz just enough to frighten a horse, all bedevilled with bumps and bruises."

"The ould father, too, warned me off his promises, and tould me to my face, he'd sooner folly his child to her grave than give her to such a scapegrace; but what vexed me more nor all, Biddy herself sent me a message that she wouldn't demane herself any more in my company, and that father Cassidy tould her to have no call to me, for I was nothin' better than a reprobate entirely. God forgive his reverence for the hard word!"

"Now, then, I saw I was out for the rob with every body, savin' and exceptin' the ould mother, who always had a kind word for me, and said, 'She only blemp't those that first driv her poor boy to take up with bad people.' And well I quit (requited) her for it," added he, with great vehemence, clenching his fist, and striking his forehead, "unnatural baste that I am! Ochone! Ochone! but to think of it! your honour. Often and often, would the dear ould soul, when I'd be down low as ditch wather, sittin' a frettin', and fumin', and broodin' black thoughts, may be, whither I'd better let them be fashin' for me some fine mornin' at the bottom of the mill pond. Often, with the big tear a tremblin' in her eye, and the kind heart of her meltin' and burstin', plain enough to be seen in the poor body, often would she say to me, 'Well! never mind, Billy Conolly! I hold up darlin' and don't take on so. To be sure you've been out o' luck for sartin, but it's a long lane that has no turnin', and tho' I can't say but you've run the wrong side of the poet a bit, yet my poor boy's not lost entirely, like them guzzlin' craters that sit swiggin' and smokin' the whole livelong day, willin' to dhrink the river dhry and soak up the say itself, if it's salt wather was whiskey.'"

"My heavy curse light on it for whiskey," exclaimed the poor fellow earnestly, interrupting his story; "and the curse of Crum'll on him who first put it to the lips of Billy Conolly; for sure it's a scorchin' fire that burns up the brains of the world, and hardens the hearts of them that makes or meddles with it."

"And this is the way she'd be talkin' to me, your honour, in my trouble, without onst throwin' it in my teeth, or sayin', 'Ill you've done Billy Conolly'. And one day, thinkin' I had a dr , because I was a little contrary with her, she said, takin' a houl't of my burnin' hand, and lookin' in my face for all the world, as if the ould heart of her was spakin' in her poor eyes, she said:—

"Oh lave it off, darlin' honey, lave it off for the sake of the ould mother that won't be with you long, and has never a want nor wish in this world, but just to see you aisy in it, afore she's cradled in the ould earth."—Oh! I thought I'd dhrop with shame of my ill doin's, and there was such a choakin' in my throat, that I felt as if I'd never spake again, till the bairn's head of me fell weepin' and sobbin' on her shoulder. 'Oh Billy, dear,' says she, 'don't kill me quite, for a salt tear from you is the only blister that rises now on my withered heart! but promise, honey, you won't again go nigh that weary Sheebeen', where the thief of the world that keeps it, first tuck in my child to cocher (associate) with them that done him no good. Cheer up like a man, an' take to the spade again kindly, an' look after your own little place as you used to do, and we may be aisy and happy again; an' Biddy herself maybe 'ill come round to your side when she finds you takin' up entirely, an' attendin' to the main chance once more. Besides,' says she, 'when my child comes

home again,' (for she always made bould to call your honour so,) 'he'll take your part I'm sartin, an' you'll always have a good friend with the bar'net any how.'"

"And sure enough, your honour, I was beginnin' to be a little aisy, and was just tryin' to turn a hand to one little job or another, to make all squares with the rint for the landlord, and the juty fowl for the mistress, when jist comin' out of the cabin door one day, with the pig in my hand, ladin' him to the praty skins in the trough, who should be passin' quite close forenent me, as fine as a horse, with that curse o' God scaldcrow, the vagabone miller's man that was the cause of all my troubles, swiggin' an' smirkin' a one side of her, and she noddin' an' smilin' an' lookin' as plased as punch,—who should it be, as sure as a gun, but Biddy Farrell her own self!"

"Oh sure a flash of lightning ran thro' me that minit, bones an' marra'an' all. The first thing I thought of was, to rush on the fuke niger, that was thremblin' in his skin, (for he was sadly afeard o' me), an' lay him sprawlin' on the earth afore her; but I was so struck all of a heap, that I was as wake as wather, an' fixed like to the spot. I cou'dn't spake for the chokin' in my throat, tho' I was burnin'; the ould dhrops stood on my forehead, an' I cou'd only clasp my two hands and cry,—'Oh Biddy, Biddy, do I live to see this?'"

"Blame yourself," says she, 'Billy Conolly, for it's all your own fault; and she turned from me with a toss of her head, though I thought I saw her pale lip quiverin' as she said it. I leaned for a mit up again' the jam of the door, to look after 'em, and got my strength enough jist to stagger into the cabin again."

"Mother!" says I,—but I cou'dn't say any more till she brought me a dhrop of wather to moisten the tongue that was parched in my mouth. 'Christ save us! my child,' says she, 'what's the mather with you, but you look like the pictur' of death.' 'Mother,' says I, 'it's all over with Billy Conolly, an' there's no livin' here any longer for me.'"

"Oh don't say so, darlin', says she; 'tis only the ould gloom cloudin' you a bit, and you'll be cheered again to-morrow.'"

"I didn't tell her what happened, and she cou'dn't know how bad it was with me; but the ragin' storm was pace and quiet to what was tatterin', an' tamin', an' thumpin' inside o' me that minit. I felt the heart freezin' in my body, and I wondered how I cou'd wish or care for any thing in the whole universal world."

"In this desperate takin' I found the way to the Sheebeen-house again, where I thought I cou'd never squinch the thrust that was a chokin' me; an' as the divil wou'd have it, beggin' your honour's pardon, the rigiment marched into the village that very day, and so, I resolved to go for a sodger an' be revenged of both my frinds and my inimies. An' here I am, your honour, a lost sheep, strayin' far away from the sweet pleasant walks of his early days, an' who never thought to have his heart warmed again with the glance of a kind eye, till he had the good luck to meet with his young master among the Philistines like himself."

"The poor fellow wiped his eye with the skirt of his jacket as he finished his story, and blubbed audibly while he turned away to hide the feelings it revived in him."—Vol. 2, pp. 77—89.

* * At the request of numerous subscribers who desire to make up the 'Athenæum' into half-yearly volumes, we this week devote a leaf of our paper to the Title page necessary to complete the volume ending in June. This is so arranged that the leaf may be cut out without interfering with the paging. In like manner a single leaf in our next week's number will contain the Index.

SHADES OF THE DEAD.

NO. III.—COLUMBUS.

THE result of the prolonged existence of the earth has been to extend the field of man's free and unfearing agency. This is the natural effect of accumulating experience.

The ancient world, so far as any single nation knew it, was a narrow island of solid soil, rooted to the centre and overarched by its own definite firmament, while all beyond was vision, mystery, and the substance of a dream. Men looked from their fields and watch towers into distant lands as we gaze from some hill-side upon the vague brightness and mingling colours of the evening clouds and the calm ocean. The earth of which they had knowledge was encompassed by imagination and tradition, with a thousand mythological kingdoms, with the cities of Men, the golden bowers of Olympus, the gardens of the Hesperides glimmering through the desert, the icy habitations of Caucasus, and the banquet halls of Ethiopia. The Greek who saw the stars arising out of the sea might fancy that they had won their brightness from the glorious islands of Antilla or Atlantis, in which they reposed by day, and which were hidden in the distance from the eyes of men. Along the doubtful margin of the actual world gigantic monsters and lovely shadows walked half visible. Mighty lands in the conception of the Christian, around the more certain sphere in which he dwelled, were peopled with the holy descendants of Seth, with the progeny of demons, with angels themselves, and loathsome fiends, and innumerable wondrous ministers of human temptation or servants of saintly triumph. A broad belt, filled with beings as strange as the shapes of the Zodiac, encircled in the mind of every one the little region to which he was himself accustomed, commanded his awe, and repelled his inquiry.

Of the men who have dissipated these fancies, have fixed the clouds into solidity, and chased the shadows from the ends of the earth, the chief is Columbus. He accomplished more than any one else towards making us masters of the world on which we tread; and giving us, instead of yawning abysses and realms of vapour, wide waters for our ships and lands for the city and the plough. He has rendered to the world an imperishable service. He stands in history as the completer of the globe; the conqueror who has added to the commonwealth of mankind unheard of provinces and barbarous tribes. The barrier within which we moved with reluctant terror, like a lion in a circle of protruded spears, impetuous but fearful, was broken down by that Genoese sailor, and all around us was laid open to our onset. The mound on which so many phantoms poised themselves, and displayed their wings, was by him uprooted from its foundation, and made to mingle with the sky. Thenceforward there was no limit to the action of any thought; no walls confined the arena of human enterprise but those which the nature of things has appointed.

The kind of good resulting from the success of Columbus is one peculiarly adapted to win the admiration of the present age. He enlarged and strengthened the mechanism by which we work, the material on which we employ ourselves. Could all knowledge of the man be destroyed, the great action of his life would be commonly held up as the most beneficial that any one could perform; for it dispelled innumerable visions, valuable only to men's fancies and affections, and incapable of being employed in the sphere of reality. It brought under our certain knowledge, and subjected to our activity regions and faculties of nature, from which we have drawn unmeasured physical advantages. Neither was there any thing even apparently accidental in this acquisition; Columbus always pointed it out as the certain consequence of his design. The bringing together distant countries, the increase of wealth, the excitement of commerce, were inherent in that thought which occupied half his life. Was he then nothing else than such a man as may invent a spin-

ning-machine or a steam-boat—as may originate great changes in the material possessions of society,—as may show himself earnest in opposing, and incapable of comprehending the seers of visions and the dreamers of phantoms. Did he resemble the idols of the nineteenth century? or was he fit to be a great man of that age which produced the Reformation?

The greatness of that period, no more than of any other, consisted in the neglect of mechanical and material objects, nor naturally involved it; but it implied the estimation of mechanical things as instrumental, and not as ends; and never but in this way has aught seminal been done even in mechanic discovery. So was it with Columbus, who more than almost any man augmented the means of mankind. Look at his whole life and all we know of his mind, and see what it is that distinguishes him. Not that he discovered America, for a fisherman driven to sea by a storm might have done this; but he is marked out from other men by the spirit in which he conceived his enterprise and the objects which he proposed to himself. His intention was to clear up doubts, to solve difficulties, to disperse a thousand misty errors, to gain for European action a new and immense field; but his motive, and it is from this that we must judge the character of the man, was chiefly religious.

In his own letters, addresses, and narratives, that which strikes us as different from the writings of any other bold and instructed seaman, is the constant appeal to religious authority. He looks forward with joy and confidence to the reception of the true faith by great countries, and to the acquisition for himself of wealth which shall enable him to make another crusade, and recover the holy sepulchre from the hands of the unbelievers. He asserts again and again, as the foundation of his enterprise, the trust and certainty that God had given him, in the hope of leading the way for Christianity to vast and unknown kingdoms, then pagan and blind; and, in addition to those sound and scientific reasons for the existence of a western land, which no man in his own day could refute, and the accuracy of which was proved by his success, he supports his plan by a strange variety of arguments taken from religion and prophecy. He was a diligent student of the Bible, and from it he draws a hundred misapplied predictions. In his conviction, the attempt to which he devoted himself was designed from of old by Providence, and he, as its selected minister, was watched over by saints and angels, and the mother of the Lord pointed his path along the waters. The cross was the ensign of his triumph; and his task was almost accomplished when he had first displayed the emblem of his faith on the shores of the new world. Year after year, through all the changes from success and honour and delegated sovereignty to sorrow and shame, amid the vicissitudes of poverty and disease, until his melancholy death, he was constantly occupied by thoughts of the vows which he had made in the freshness of his hopes, and which he had not been able to fulfil; his dreams assumed the shapes of heavenly messengers, and uttered to him discourses of providential warning or holy comfort; and when courtiers and adventurers were alike intent on the one object of enriching themselves in the colonies he had discovered and then commanded, when the priests who had been sent to aid him were busy in plotting against his power, he meditated on the prospect of rescuing Jerusalem from the Mussulmans.

Columbus, the great overthrower of the fantastic and mysterious idolatries which were founded on the ignorance of mankind, the man who more than all others routed the vague phantoms, that to the mind of every one, filled the unknown earth, did not therefore want a child-like simplicity of faith in the truths of religion. He separated for ever the two worlds of the infinite and the finite, and cleared our knowledge of each by drawing a broad line between them. His genius enlarged and completed the domain of man's physical exertion; but his mind was still as true as ever to the existence of a higher region needing not the patronage of courts for its discovery, and revealed to us by a mightier being

than he. He explored and opened to the light of day the provinces of fancy and mythology, but was to the dishonesty of those who overlook that he left to the spirit its own serene kingdom, and bowed before its heavenly tabernacle. What he added to our material world he did not take away from the immaterial; but while he excluded for ever from a part the shadows and superstitions of ignorance, he would have subordinated the whole to religion.

It is true indeed that the religion of Columbus was not the purest Christianity, though exalted in his mind to a nobler faith than that common in his age. He sustained himself through a thousand conjunctures of uncertainty and danger by a trust in Providence, which was the most remarkable quality of his character. In him the latest brightness of Roman Catholicism displayed itself, and when in that form Christianity had reached, if not subdued, every portion of the world, nothing remained but the task of internal reformation.

But though the mind of Columbus was in many respects dark and weak, in this it was strong; in a religious hope and reliance, which taught him to refer immediately to God whatever of clear knowledge and new illumination he possessed. He felt himself marked out and appointed, with the other especial servants of Heaven, to perform a high spiritual work. The vividness of his intuition, the strength of his hope, he did not seek to account for from the accidents of his character or the scattered learning of his life. He thought that all was given to him for a predicted purpose, and that he was ranged among the patriarchs and prophets chosen from of old to do the work of Providence. The wise men of our day will mock at him for his childish credulity; but let no one despise this holy enthusiasm, unless he too has felt as strong a faith as belonged to Columbus in the distant and hidden, and as ready an energy in attempting to substantiate for all men that which before existed but in the thought of one; and having felt these, can assert the possibility of their action without any mixture of humble piety. He was indeed in all things childlike: childlike in his humility, childlike in his confidence, childlike in the keenness and freshness of all his sensations; yet was it he who discovered, and by this very unfearing simplicity of heart, that new world which has changed the whole condition and subsequent history of the old.

The name of the discoverer of America would give us, if we wanted accurate knowledge, the conception of a vast and iron mind, trampling over obstacles, compelling kings and seas to yield to him, and realising the cloudlike dreams of antiquity by an act of will as imperative and irresistible as that by which the ocean god framed and lifted over the water the island of Apollo. He connects himself with the stern benefactors, the heroic shadows of antiquity Jason, and the warlike Bacchus, and the wandering Hercules. The fancy naturally conceives of him as a mighty spectral shape leaning, like some old sea phantom, on a gigantic rudder, and fixed for ever in dim and unmoving sublimity on some icy crag of Darien, with two worlds of water spread below him. A form remote, immense, and unapproachable, alone seems suitable to his fame. We cannot imagine him as a man beat back by daily opposition, impeded by the follies of the vulgar, checked and stung by the reptiles of society; and the act which revealed a second world likens itself in our thought to the simplicity and singleness of a creation.

But alas! this bold, imposing, and right-onward course, this unity and distinctness of action, can scarcely exist among men but in some false and melo-dramatic appearance. To struggle and agonize, to win a little way by much exertion, to be attended in our completest triumphs by the shame of some particular failure, or to be cut off in the midst of hopes brighter than any we have realized, is the fate of humanity. In Columbus we do not discover one great inspiration displaying itself in action as soon as attained, and leaving to him whom it favoured, nothing for the future but to die in its renown. He does not delineate himself in history with a few vague shadowy lines, in which none

the half tints and finer lineaments of man can be discerned. But we see him throughout made up of much greatness and some weakness, encompassed with obstructions so petty that one would wish him to blow them away like cobwebs, yet so strong that giant as he was he frequently could not escape from them; often baffled and sometimes irritated by the despicable; and such, that his effigy ought to be moulded by the historian in gold, not virgin, but tormented into purity by the furnace.

We trace him with more than the interest which follows a hero of romance through the doubtful and adventurous years of his earlier life. There is a meditative curiosity which yearns to discover in what obscure and silent conjuncture of his vigorous manhood the idea of the world's completion by his means first dawned over his imagination: we can only know that his mind was built up into its strength amid the incessant affairs of Mediterranean commerce and war, by experience gathered for a vile price, and at the risk of life, by knowledge slowly and dispersedly collected, and above all by faith the master-principle, not to be learned from without, but drawing the life and strength and loveliness of all things to its own high inward service. With how many strange doubts and misgivings, and momentary temptations of a magical fancy, and recurring terrors at the very rashness of his own conception must this great man have contended, whether in his narrow chamber, or on the unsteady deck of some paltry bark, guided between Spain and Italy, with a crew of a half-score men, by him who was first to break the gates of the Atlantic. Image him in his little cabin studying by the flickering light of a solitary lamp, and to the sound of the winds and waters, the marvellous descriptions of Marco Polo, or the more pregnant pages of Scripture, in which with tremulous yet confident expectation, he taught himself to read the memorable prophecies of his own enterprises, and evidences of his special selection. Image the poor adventurer, the son of the Genoese wool-comber, and a sailor since his early boyhood, wrestling for the sense of some dark saying which he wanted learning to interpret, and finding its significance come gradually glimmering, as it were, out of the page at the call of his earnest reliance; conceive him weighing, hesitating, trembling, turning to the stars an eye of hope, repeating a hasty supplication to the saints, reviewing in his thoughts the large and mixed array of testimonies on which he had employed years in building up his trust, resting at last with secure triumph in the certainty which God had given him, till again he turned away with terror to consider the inadequacy of his means for the fulfilment of his mission: thus by the effort of an honest imagination let us paint Columbus, and we shall help ourselves to think what and how great he was.

The wondrous magic-lantern of history shows him to us a poor wayfarer, accompanied by his son, and appearing on foot at the gate of a monastery to implore bread for his boy. The tall and majestic pauper, with his ruddy cheek tinged by years and hardship, and bright hair so early turned to snow, must have presented a singular portrait of freshness and courage, battered, but not overthrown by misfortune. There was a spirit in his clear grey eye which while he discoursed to the Prior of Santa Maria de Rabida, on his designs and convictions, would indicate that he had in himself that union of the heroic and saintly character required for so perilous an enterprise. And probably he who heard Columbus speak with the honest and earnest simplicity through all his life so peculiarly belonging to him, must have perceived a power in his words that softened the contrast, so strange to us, between the condition of the solitary beggar, and the vastness of the thought which he announced.

O! immeasurable scope of human genius! O! mighty strength of trust in God! O! miserable inequality of earthly fortunes! O! mysterious complication of mortal power and weakness! how wonderfully are they all displayed in the story of Columbus! And how much of faith in the sincere and humble workings of the mind may we certainly

derive from the contemplation of this minister of Providence a mendicant at Palos; in his frail skiff the discoverer of the largest of the world's continents; at Barceloua received by kings, with more than the honours of a triumphant consul; then brought in chains from his own new world; and at last on a neglected bed of pain and death, carrying with him amid his heavenly hopes, the consciousness of how noble a deed his life had accomplished, and leaving to mankind the inheritance of America, and the memory of another pure and creative mind.

A LAMENT

WHERE is the light of many a summer day,
Where is the bloom of many a fresh spring flower,
Where be the beams which with such joy did play,
In every drop yon feathery fountains shower?
Where be the songs of birds beneath the spray?
Oh, where all lovely forms faded from earth away!
Would I could cease to shed
These unavailing tears and be as they!
Too well I know whither ye have fled,
Sweet friends! Hast thou not charioted,
Oh Death, all that I loved to its eternal bed!
Thou hast, thou cruel Death! O most unkind,
To take my sweet friends hence, and leave my heart behind!

THE COQUETTE.

WHAT is she worth, who bendeth back her head
To whispering tongues, when her mute lover's nigh;
Joying to mark the feverish, flushing red
Of jealous rage into his features fly?
Who, hasty despot, useth tyranny
Before those chains be riveted, which bind
For ever to her yoke; what cruel eye,
What hard heart weareth she, what wanton mind
To torture him the beautiful, the true, the kind!
Hath she the bosom which should proudly be
A pillow to his head, when vex'd with care
His weary spirit from the world shall flee,
And look to find a world of comfort there?
Oh! think it not: for rather she, than share
The heavy burden that weighs down his soul,
Shall heap it with her taunts; her words shall tear
The last sigh from his heart; her fierce control
Make the unpitied tear-drops down his bosom roll.
Oh! fly from her, the tyrannous, the strong,
The cunning, the hard-hearted; mate not there!
The honey of her looks shall dry up long
Before their flow'ry blossoms faded are:
The tangles of her soft and silk-like hair
Anger shall turn to grey long ere her prime;
And, when the temple is no longer fair,
Its inmate devil shall win strength from time,
And gather mightier pow'r for cruelty and crime.

D. R.

MILTON'S 'DOCTRINE AND DISCIPLINE OF DIVORCE.'

SIR,—I think the essay upon Milton, in your 'Athenæum' of the week before last, has filled up a yawning chasm in our literature, which, from the failure of previous attempts I had feared would never be closed. Dr. Channing threw into it a great quantity of earth with some rich ore; but there is a certain binding quality which one never finds in the best American soils, and the want of it was proved in this instance. The author of the very elaborate article which appeared in 'The Edinburgh Review,' a few years ago, acted Curtius very valiantly; but then it was not Mr. Macaulay who was wanted to make the ground unite, but Milton. Your contributor has thoroughly understood the difference, and, so far as I may be permitted to judge, from the faint outline of Milton's features, which has dwelt for some years in my imagination, he has brought the living man most completely and admirably before our eyes.

I was particularly obliged to him for not wasting his own time and his readers' in making categorical answers to the different charges against the character of Milton. All the former biographers of the poet have been exceedingly tiresome upon this point, and, what is still worse, very unsuccessful: and well they might be; for, till we have some idea of Milton's character, how is it possible that we can have the most distant notion whether any actions of his life were glorious illustrations of it, or shameful inconsistencies? It is very well to expose the lies, the broad, palpable, probably wilful, lies in Dr. Johnson's biography; but further than this, no wise defender of Milton will go, till he has satisfied himself of many points which neither Dr. Johnson's biography, nor any other, will ever teach him. When Dr. Johnson says of any thing which Milton really did, 'this is wrong;' and when Mr. Simmons answers, 'No; it is right,' who cares for Dr. Johnson or Mr. Simmons? All the one means to say is, 'In similar circumstances, I would have done differently;' all the other means is, 'In similar circumstances, I would have done the same.' And who are you? The friend of Mr. Boswell; and a gentleman who has taken priest's orders in the English church. Both were, no doubt, extremely good judges of the conduct which befitted them in the different emergencies of their lives; but as neither of them happened to be Milton, neither of them could exactly deduce from that knowledge what conduct was proper for him. That we can only tell when we have learned who Milton is; and that learning, as your contributor has discovered, one person only can teach—Milton himself.

Now, however, that so much (in my opinion) has been done to remove our ignorance upon this subject, we are in better condition to examine those few objections which have, from time to time, been raised against this transcendent character. Most of them are very trivial; not one ever left an injurious impression upon any earnest and simple reader of his works; but still they annoy the minds of the weaker brethren, and they are vexatious instruments in the hands of the foolish and the evil-minded. If you will allow me a column in your paper, I will just examine one of them, perhaps the only one, (as Montesquieu's remarks upon the duty of taking office in a republic, are a sufficient defence of the Latin secretaryship,) which materially affects the estimation in which he is held at the present day. I presume those who read this letter to have also read the essay, as only by the light it has afforded me, shall I be able to expose the hollowness of the charge to which I allude.

Milton married a wife; Milton and his wife disagreed; Milton wrote a book in which it was maintained, that other offences, besides adultery, were legitimate reasons for divorce. This is the narrative expressed in the way which is the least favourable to the accused party. The argument grounded upon it is,—that Milton was anxious to be emancipated from his wife; that, to accomplish this purpose, he was willing that other men should enjoy equal liberty; that, in order to secure their enjoyment of it and his own, he made war upon a sacred institution, and wrested scripture to his ends; and that, since he was prompted in this one instance by selfish motives, and since it is evident from all his works that he connected this kind of freedom with all the other kinds for which he pleaded, there is at least a suspicion that he was similarly influenced in every case.

What is my answer to this charge. That Milton was not influenced by his own domestic circumstances in forming his opinions respecting divorce? No, sir! that he *was* influenced by them,—that they added immense weight to all his arguments,—that they furnished him with a new argument,—and that herein we find one of the most striking, the most beautiful, the most consistent manifestations of his character. Before any one reads further in this letter, I request him to take down from his shelves the volume of Milton's works which contains 'The Doctrine and Discipline of Divorce;'—I fear it will require first to be dusted,—and that done, let him

open it at random, and read any chapter he pleases in it. What does he find the most obvious peculiarity of the book? Is it not the absence of all arguments drawn from policy and convenience? This, which is the invulnerable side of those who defend the present law, is scarcely assailed; wherever chance brings him into contact with it, he turns away hastily and impatiently, and he withdraws all his force to those high grounds of the controversy—the alleged proofs against unlimited divorce, from reason and scripture. So far, it will be admitted, the book is perfectly Miltonic; it has that which your contributor has so well painted as the sure mark of all his writings—uselessness as a political treatise, because inapplicable to society as it is; harmlessness as a work against existing institutions, because it attacks them upon principles perfectly inaccessible to the vulgar,—yet is it most useful, most inspiring, most sublime, as revealing to us ‘that soul that was as a star and dwelt apart,’ in a region which all must strive to reach, and most by those helps which he discarded. So much for the negative characteristic of the treatise. What is its positive? What is the main pillar of his faith upon this subject—a pillar of which he makes those very passages in scripture that are brought to undermine it the friezes and capitals? Is it not this, that marriage, in the majority of instances, does not fulfil the conditions which are implied in it when it is spoken of as a spiritual union—a joining of hearts, the type, as St. Paul expresses it, of a high mystery, and, as such, partaking the character of that which it typifies; and, consequently, that all the phrases in Christ’s discourse, which declare that man must not put asunder that which God has joined together, are profanely applied to those alliances, which, not God, but convention, has created. Now the charge against Milton is, that he did not agree with his own wife;—that, therefore, he wished to alter the law of divorce.—that, therefore, he was a self-interested hypocrite. Was he indeed? BECAUSE he had experience that marriage was not always an union of hearts; that God did not always bind when the priest bound; that it would in similar cases be an act of blasphemy to suppose marriage, that high mystery, which the Apostle speaks of;—THEREFORE he was wrong to declare this opinion! Because the fact was demonstrated to his feelings, he was to doubt it; BECAUSE the evidence was irresistible, it was not to be produced! To every man who looks this question in the face, instead of in the tail, which is the way in which a great many very sage persons look at all questions, he must see more clearly than daylight that Milton’s arguments on this subject, though they prove nothing against the wisdom of permanent marriages, prove most decidedly that his opinion originated in a most deep and solemn reverence for the scripture, (the words of which, in his mind, had that rare addition of a meaning,) and a reverence not less deep and solemn for this ordinance; both of which feelings derived strength and confirmation from the unfortunate circumstances of his life; which, if he had been a less glorious and heavenly-minded being than he was, would have weakened or destroyed them.

But there may be some person whose malice-begotten idiocy has reached such an intolerable pitch, that he will inquire why Milton should have chosen this kind of argument, from reason and scripture, rather than the one from policy, in using which his experience would have been nothing worth. Why did he not? Why did he not write the *Queerist’s* last contribution to the ‘*Lady’s Magazine*,’ or ‘*The Westminster Review*,’ instead of ‘*Paradise Lost*?’ Why was he not a sneering, snarling, pugnosed puppy of the nineteenth century? Because he was John Milton, to be sure: what other reason would you have? If he had placed the hinging point of his doctrine of divorce in the inconvenience of the existing law, that treatise would have stood in desolate singleness among his works, unlike any thing that his mind ever created, or his pen wrote, a strange mysterious anomaly, which might have given reasonable colour for the explanation, now as unnecessary and ridiculous as it is calumnious,—that

it was prompted by some motive different from any that ever actuated him before or since, and, consequently, a worldly one.

Every child knows by what device wolves were extirpated out of this kingdom. A new, loathsome, and obscene race of creatures has since been generated in the land, by various crosses between hyæna and cur, and public decency calls loud for their instant destruction. It is impossible not to know them by their horrid yelp, and by the assiduity with which they snap at every war horse that will not condescend to kick them. To the perpetual biting of these brutes, the wound upon Milton’s heel, which I have been treating in this letter, is owing. But, I repeat it, the whole tribe, with all its bastard varieties, and whether its delight be in the blood of the living or the dead, must be put down. If it cannot be extinguished after Ethelwolf’s fashion, by a government premium upon heads, much may be done by individual enterprise. Each of you, good readers, occasionally meets some one of the breed at dinner tables, and let him feel it a matter of solemn conscience not to rise from that table till the creature is crushed. He will begin to wag his tail at dinner, fix your eyes upon him then, and swear that he shall not leave the room with one whole limb. None know, till they have tried, what their powers may effect in this way; and it is no act of high self-denial that I am enjoining; it is the most delightful exercise which the human limbs can practice. There is no sensation on earth like the certainty that you have the knife upon his carotid artery; there is no music in nature like the agonised howl with which he expires. The murderer feels himself at that moment within the scope of the Psalmist’s benediction. ‘Blessed is he that shall dash their heads against the stones.’

I was delighted, sir, with that part of your contributor’s paper in which he spoke of the use that is made of Milton’s name by the boy jacobins of the day. I wish some of those persons would have the goodness to inform me in what portion of Milton they claim an inheritance. In his arguments? Let them tell which they have ever used, or would ever think of using, to prop any opinion of theirs. How could they? Their calculations are avowedly made upon the meridian of a society infinitely below any which has ever existed in the world; it is their boast that they provide against possibilities of depravity which human nature has never sounded; his belong to a state of perfection which a less imagination than his can scarcely conceive of. Their republic is a dunghheap compared to which that of Romulus was a fragrant garden; his republic is one, compared with which that of Plato was an earthly dream; they suppose man to be exhausted of every attribute which is not beastly; he supposes him to be purged of every inclination which is not godlike. If the reasonings of the one will sustain the conclusions of the other, then might Circe’s hogs reasonably frame their notion of a polity for their sty, out of the intimations which their wiser companion had received from Pallas respecting the hierarchy of Olympus. But, perhaps, it is not the arguments of Milton on which they rely, but his spirit! Oh, no doubt, that is vastly congenial! No doubt, his feelings respecting ecclesiastical government, for instance, and the evil of an established church, are exactly accordant with those which they entertain. How I should like to see them, side by side, expressed in the words which burst most naturally from the soul of each. There we should have a column of calculations to prove that religion could be done some thousands of pounds per annum cheaper in France and America than it is in England; here a magnificent philippic against some Simon Magus among the prelatists, who fancied that the gift of God could be purchased for money; there a fierce abuse of the clergy, for basing morality upon the unintelligible groundwork of duty, instead of upon the plain, straight-forward principle of self-interest; here an awful arraignment of them before the tribunal of heaven for giving the weak ethics place, where they should present only the sublime motives of religion; there an apostrophe to

the salaried genius of the Constituent Assembly, to take the English church under its guardianship; here a prayer that the prince of all the kings of the earth would come forth out of his bridal chamber, and put on the robes of his visible majesty. But is not our mode of talking vastly superior to his? Does it not indicate what a stride the country has taken in the last one hundred and eighty years? Who denies it? But why then claim Milton? Of course you are far more enlightened than he was, and, therefore, it is that I wonder you should care for such an insignificant ally; that you should suffer yourselves to be disgraced by the co-operation of a person so utterly your inferior. The truth is, you are under a delusion; you had merely heard of Milton, and were perfectly ignorant who and what he was. Now you are wiser. I am sure you will be hasty to disclaim him; eager to admit that, however he may have seemed to resemble you in some faint particulars of your greatness, no living man had ever less real pretension to the honour of your patronage; finally, most glad that he should take his station among the vulgar supporters of those worthless truths, which, instead of being struck in the mint of the nineteenth century, have been in wear since the first day of creation, when they came forth with the image of God stamped by his own hand upon them.—I am, sir,

Your obedient servant,

X.

FINE ARTS.

Portraits and Memoirs of the most illustrious Personages of British History. By Edmund Lodge, Esq. Norroy King of Arms. F. S. A. Fourth Edition, with an entirely new set of Plates and sixty additional Subjects, completing the work to the present Period. Nos. 1, 2, and 3. London. 1829. Harding and Lepard.

ON occasion of the opening of the Exhibition of the Drawings made for this undertaking, we expressed a very favourable opinion on the nature of the publication, and our cordial concurrence in the general approbation with which it has been received by the public; yet now that the first numbers of the new edition come before us, we are tempted to return to the subject, and to add, that the work, in its present form, appears to us one of the best adapted, as well as one of the most extensive, applications of the art of engraving ever devised.

The possession of a gallery containing the portraits of British worthies must be an object of almost universal desire; and we cannot imagine a more appropriate mode of fitting up a library, than by hanging its walls with these engraved resemblances of the personages whose exploits and character form the history of our country, and the subject of our studies. The interest excited by such a collection must have been felt by all who visited the exhibition of the drawings; and that interest may now be transferred to the house of every private gentleman throughout the country; for it can be little, if at all diminished by the exchange of painted for engraved likenesses, since it is intrinsic in the individuals represented, and is wholly independent of the material in which the resemblance is executed.

The features, air, and character, and perhaps the costume of the personages, (and it is for these that we seek and not for the work of art) or a specimen of excellence from the pencil of a particular master, can be preserved as well in an engraving as in a drawing of equal dimensions; and few will complain, on turning to the plates in these numbers, that the drawings from whence they are taken have not been done justice to.

The engravings, in short, are excellent specimens of the art, and deserve our warmest commendation. What, for instance, can be more clearly and beautifully executed than the portrait of Sir Philip Sidney, which forms the first in the collection here presented? What could be more lovely, were it not for a little of the Holbein starchiness, (and yet who would desire

the absence of the starchiness so characteristic of the state of art in that age?) than the portrait of Queen Anne Bullen? Nor is the likeness of the unfortunate Earl of Stafford, after Vandyke, the least interesting in the three parts now before us. The head, above all, is remarkable for its expression of life and powerful character. The other portraits are the Countess of Sunderland, after a splendid Vandyke; Wolsey, and Cranmer, the former after Holbein, the latter after Gerbicus Flicciis. The Lord Burghley, by Mark Gerard; and Sir Walter Raleigh, by Zuccherro are, both mannered portraits, but are both excellently engraved. The former is especially brilliant. There is no false pretension nor charlatanism, in fact, in this publication: it is worthy of the country and of the great names it illustrates; and it is a work in short which, as it well deserves to have done, has already become classical.

THE DRAMA.

King's Theatre.

Venit summa dies! Mademoiselle Sontag has enraptured us for the last time! She took her farewell of an English audience on Saturday night, after a representation of the opera of *Otello*, having added to her laurels by a quick succession of very varied and talented performances, the two final ones of the train being those which we have now to notice.

On Thursday she appeared in the character of Zerlina, in 'Don Giovanni,' Mademoiselle Blais being her substitute in that of Donna Anna, and Mademoiselle Monticelli having reached the rank of Donna Elvira. These changes, we regret to say, have been rendered necessary by the continued indisposition of Madame Malibran, a circumstance, for which we cannot be consoled by those novelties to which it has thus given rise. For the most part, the opera has lost much of its effect by the transposition of the *personaggi*. Mademoiselle Blais sank rather below the average of her merit, and failed to throw either brilliancy or interest into the character now assigned to her. And witnessing this failure, we could not help recollecting the great comparative beauty of the performance, both last year, (when Mademoiselle Sontag supported Mad. Malibran in the principal part,) and in the former representations of our present season. Neither does Mademoiselle Monticelli at all improve upon acquaintance. Indeed, it surprises us that upon her first début in England, there ever could have existed that lenient, and almost favourable impression of her qualifications which tempted an audience to sit out the opera of 'La Donna del Lago,' with so lamentable a representative of the heroine. Her gait and action are the most ungainly we know; her voice is feeble than ever; and she has not even the skill to disguise its incapacity, or omit the passages which are beyond its power. Though not so good a singer, Graziani is a far more lively and judicious actor than Porto; and his figure, costume, and general bearing through his part of Masetto, had an appropriateness that was certainly an improvement upon former times. Signor Donzelli, the hero of the play, perhaps fails to give his character the prominence which, in most cases, is sure to attend him; but if this be so, he at the same time avoids many of the blemishes which disfigure his execution of Rossini's music; his terrible fondness for andantes, his invariable *sostenuto*, which operates like a clog in the wheel of the music, while the fullness of his voice extinguishes those of his neighbours. There was much curiosity to see Mademoiselle Sontag in her new character. The rustic simplicity and gaiety of Zerlina seemed well adapted to her powers of personation, and a feeling of retributive justice was pleased to have an opportunity of compensating to her in this part, for the want of interest which seems incidental to that of Donna Anna. Accordingly, she encountered a welcome more hearty than ever greeted her before. From first to

last she was the object of all applause. No one could contest it with her; for the feeling of the house was evidently borne along in one direction, and would not deviate for the sake of any but herself. Upon her *entrata*, the duet with Masetto, 'Giovinette che fate all' amore,' was encored, of course, and deservedly, for her animation was beyond herself, and the liquid flow of her singing had never been surpassed. The next duet, that with Don Giovanni, 'La, ci darem la mano,' was also encored; perhaps from habit, or the *furore* of the night, for the performance of it was vitiated by some misplaced embellishments, and a cadence that had no fellowship with Mozart. Then came the beautiful air, 'Batti, batti, o bell Masetto,' the first movement of which was executed with as much tenderness as the concluding allegro displayed playfulness and spirit. This was also encored. Lastly, the cavatina, 'Vedrai Carino,' as beautiful as any, and as sweetly executed;—did not this also receive the same compliment? Never, certainly, was there a stronger body of votaries to the lady's cause, more zealous to show their adoration, and more uniform in their method of proof. The immense theatre, not more fully crammed in the height of the season, had scarcely one dissentient or callous auditor in all its crowd. Had their idol selected this for her last performance, we believe that the extent of their sympathy and enthusiasm would have been shown by acts of absolute puerility. As it was, the part of Desdemona did not so strongly awaken their sensibilities, or, as we suspect, the audience on the latter occasion was one of a different and more phlegmatic temperament.

Strange to say, the house on Saturday evening was not crammed to suffocation. Perhaps the town had thinned in the intermediate time, or had grown philosophical and loved analogies, so that it was led to believe there would be another 'last night of Mademoiselle Sontag's performance,' because such had been the case in the year 1828. But this was not all. The temper of the audience was cold, and never betrayed into one burst of admiration throughout the evening, if we except that at the close of the opera itself. Perhaps the very character of Desdemona prohibits the casual and isolated expressions of applause, which are too frequently taken as the tests of a performer's merits. The music, as well as the dramatic interest of the part, is too continuous and unbroken, to leave room for halting places where one may stop and gaze around, and say, 'this is good:' or, though we deny the fact, it may be, that Mademoiselle Sontag's representation of the character is not a favorite with the public. Another possible cause of the absence of much fervor, on the part of the audience, may have been their discontent at the compression of the opera for the sake of brevity, by which means some of the most beautiful portions, especially the first appearance of Desdemona, and the air 'Oh! quante lagrime,' were squeezed out. The conclusion of the opera suffered terribly by the same process. Every thing after the murder of Desdemona is lopped off, and this amputation both deprives us of some beautiful music, and serves to terminate the drama at a point of too intense interest,—when the emotions require some restorative, some sequel, to recal them to their ordinary degree of calmness. De mortuis nil, &c. But for this impulse, we should be tempted to quarrel with Mademoiselle Sontag for one or two peculiarities in the course of the performance. But she is no more to come under our animadversion—whether to praise or to censure. She has left us for this season, and it is understood that before the opening of another operatic year, she will have deserted the stage for ever. It can serve no end, therefore, whether preventive or remedial, now to note down the inaccuracies and imperfections, which, to the feeble and ignorant judgment of such as we are, have appeared hitherto worthy of notoriety, more perhaps from captiousness or ostentation, or mere error, than with much justice or necessity. Surely, too, it is well to preserve, as

pleasing as possible a remembrance of these sources of our enjoyment, undefiled by the tiny blots and blemishes which it might be in our power to recal. And therefore, we will say no more of this final display of Mademoiselle Sontag's talents, except inasmuch as it gives us an opportunity and excuse for adding our good wishes to those of the thousands who, on that occasion, testified them upon her departure with acclamations which affected her to tears. The history of this most gifted lady will form a singular fragment in the annals of music. Her personal character and situation, the suddenness and universality, and, sorry are we to add, the short life of her public renown, will separate her from the crowd of her predecessors, not one of whom had excited such individual sympathy, or had raised herself to the highest pinnacle of fame, with such modesty of deportment; or had retired from it, in the midst of popular favour, with a spirit so uncorrupted, a memory so respected. A bright brief meteor,—her radiance will long live after her. We did not think to be seduced into these expressions of our feeling with respect to Mademoiselle Sontag, and our loss for the future; but they are written, and so let them go. We must add to them our conviction that the stage is now deprived of one who was its most signal benefactress; for she not only threw around it the lustre of her professional attractions, but also carried with her a purity and delicacy, and gentleness, which went far to disperse the grossness that every where walks upon it. We do not think it equivocal or invaluable praise, when we allege that Mademoiselle Sontag was the most lady-like of all the *artistes* we have known. It will be well if the influence of her amiable disposition shall last as long as the recollection of her accomplishments. Most sincerely do we wish her, in her retirement from a professional life, all the happiness and prosperity she deserves, if for no other cause than as a return for the pleasure she has so abundantly promoted of half the civilized world.

COLLECTION OF MINERALS AT THE WESTERN EXCHANGE.

AN invitation to the view of a model of York Minster has made us acquainted with the interesting collection of natural history, minerals, and fossils of Mr. Walker, in the Western Exchange. This we deem well worthy of a visit by all, but especially by those who have a turn for the study and observation of the curiosities of nature, and who delight in contemplating 'those, her grand movements, which mark the revolutions of the globe.' Mr. Walker's collection is extensive and curious, and comprises several very rare and valuable specimens, which it would be going beyond our province to enumerate; from among them, however, we may be excused for selecting for notice a few articles which seem most calculated to attract popular attention. Such are, of the animal kind, a Guana stuffed, and a large Diodon or Sea-Orb; of the mineral class of curiosities is an immense jasper from the island of Antigua; of the fossil kind, and in these the principal value and interest of the collection consist, are the forehead of an elk or deer, a horn of a similar animal, a fossil palm and root of an aloe, also from Antigua; and several other very curious fossils, formerly in the possession of the late Mr. Parkinson, and collected from the mines and quarries of Great Britain. Besides these, the specimens of amber from Mozambique, containing insects, well preserved under very singular circumstances, also form very interesting objects of observation.

The rare work of illustrations of antediluvian phytozoology by Mr. Tyrrell Artis, from the fossil remains of plants peculiar to the coal-formations of Great Britain, which Mr. Walker possesses, and in which descriptions are to be found of several of his own specimens, gives an additional interest to this exhibition.

As to the model of the York Minster, and the base-

relief in silk of the needle-work illustrative of the Revelations, and which is said, with every appearance of probability, to be of the age of Queen Elizabeth, we shall content ourselves with indicating their existence, and with adding that the former has been much commended, both by 'The Times' and 'Literary Gazette.'

NEW MUSIC.

'*Mélange*,' or *Favourite Airs from Gluck's Operas*, arranged for the *Piano-forte*, and dedicated to Miss Tatton, of Wiltenshaw, Cheshire, by J. B. Cramer. Cramer, Addison, and Beale.

A *CLEVER*, well arranged sonata in C, exhibiting Gluck's most favourite motives to advantage, in Cramer's peculiar, chaste, and sensible style. A short Introductory *Vivace Spiritoso*, is followed by an *Allegro* and *Cadenza*, prelude to the favourite minuet in *Iphigenie*, so well known by the auditors of the ancient concerts. This movement is well amplified and varied into three pages. After which, an *Allegretto* (in F 3-8 time) from *Armide*; a *March* (in B flat) from *Orfeo*, modulates again into the key of C, for the *Allegretto Scherzando*, con *legerezza*, forming a *Rondo* finale of four pages, the theme of which is selected from *Iphigenie*. The melodies are well chosen and adapted, and the whole piece does not require a very practised performer to execute it; thus will it be found of general utility.

'*Sweet Evening Star*,' in Answer to *Barnet's celebrated Song*, 'Rise Gentle Moon,' sung by Miss Love, composed by Joseph Hart. Mahew and Lee.

So positive a parody, as to leave originality out of the question. An easy, pleasing, and trifling bagatelle, requiring a voice of only nine notes, including the E on the first, and F on the fifth lines.

Select Melodies of various Nations, arranged with Embellishments for the Flute, with Accompaniments (ad lib.) for the Piano Forte, by Raphael Dressler. No. I. Cocks and Co.

ALTHOUGH we have had opportunities of reviewing a large number of Dressler's publications for the flute, in the 'Athenæum,' we have not before met with a more useful and pleasing work for the amateur flautist than that before us. Twelve interesting scraps, each occupying a page, form the work, of which the following is a brief catalogue,—viz. 1. A French Air, (formed upon the melody known as 'O no we never mention her,'). 2. *Rode's* celebrated Air, sung by Catalani and Sontag. 3. A familiar Swiss melody. 4. *Mayseder's* popular Air, op. 40, as performed by De Beriot. 5. 'La Suisse au bord du lac.' 6. 'We're a' noddin.' 7. *Mozart's* menuet, in *Don Giovanni*. 8. 'Buona notte,' a Venetian Air. 9. The hermit's Song, in *Weber's Der Freyschutz*. 10. 'Come Dolce,' from *Rossini's Tancredi*. 11. 'For tenderness formed.' And 12. The *Andante* movement, from *Haydn's* No. I. of his twelve grand Symphonies.

The whole is neatly and correctly engraved, and stitched in a wrapper, for 3s.!

The celebrated *Bohemian Melody*, 'Day Break,' as sung with the greatest success at the *Argyll Rooms*, by the *Bohemian Brothers*: arranged as a *Rondo* for the *Piano Forte*, and dedicated to Miss M. Blake (of *Athboy*), by T. A. Rawlings. Published by T. Welsh, at the Harmonic Institution.

THIS is the old German tune, to which *Kalkbrenner* put very ingenious and pleasing variations, and which *F. Griesbach* used to play as the theme of a rondo to one of his Oboe Concertos, but now revived by Mr. Welsh, for his *Bohemian Brothers*. Rawlings has offered a spirited Introduction to it (in B flat 3-4 time) and adapted three lively variations after it. Thus the title is a misnomer, the publication being an *Air varied*, and not a *Rondo*. It presents a gay, playful, and rather easy piece, well adapted for the *Piano Forte*, and those who teach upon it.

MISCELLANIES.

HANOVERIAN AND DANISH SYSTEM OF QUARTERING CAVALRY.—A recent German work gives the following account of the curious primitive mode of quartering the cavalry which prevails in his Majesty's Hanoverian dominions. In time of peace the actual service falls lightly, some regiments having five months, others three months' service in the year, leaving them, in the one case, seven, in the other nine months' furlough. During the season of exercise, the horsemen assemble first in thirds of companies, then by squadrons, and lastly, by regiments; during the rest of the year there is no assembling, except in extraordinary cases, and the only service performed is that of the guard to the staff. During this time they are cantoned so widely that generally there are not two cavalry men in the same village; while the half, or two-thirds, of the men are at their homes, on leave, with their horses. A single regiment in cantonment will thus occupy a space of one hundred square miles. The men in the villages are billeted on the householders, and each has a right to demand of his landlord, first, an airy bedroom, furnished with a bed, table, two chairs, and a shelf; and a seat by the fire, and near the candle of his host; a stall for his horse, and a place to hang his accoutrements; for his food he may enter into an agreement with his landlord, and this arrangement is the more easily made since the soldier may serve the landlord in all that does not interfere with the public service. If the two parties cannot agree to terms, the soldier is obliged to provide for himself; but, in that case, the host is required to furnish him with salt, pepper, and vinegar, and the use of the ordinary utensils. The soldier is required to do his cooking at the same time as his host, and to provide his own beverage; he is to be allowed dry forage, consisting of ten pounds of hay, and five pounds of straw for litter, the landlord to have the dung. The inconveniences of this dispersion of the cavalry in Hanover are less felt than they might be elsewhere, from the peculiar circumstances of the country, in which the education of the horses is carried to great perfection, and where the esteem in which the animals are held, and the knowledge necessary in the care of them, is very great and widely diffused. The cavalry service is, in fact, very popular, and the sons of rich peasants engage in it voluntarily, in the fear that the conscription might send them to the infantry. It may easily be conceived also, that the cavalry man, with his horse, is not the most insignificant person in the village, and if he will consent to work for his host, he is well paid. The cavalry man on furlough, on returning with his horse in good condition, is allowed a sum per month adequate to the payment for grass for the animal. The service of the Hanoverian cavalry men is generally of ten years' duration. A similar arrangement is adopted in the distribution of the Danish cavalry, and in the Swedish also; but in the latter, the dispersion is still wider, in consequence of the greater distance between inhabited places.

SCIENTIFIC JOURNEY TO MOUNT ARARAT.—Dr. Frederick Parrot, of the University of Dorpat, is about to undertake, and by this time probably has commenced a scientific journey to the Ararat, accompanied by an astronomer, a mineralogist, a zoologist, and a botanist, and by several students of the university, who pay their own expenses. The Emperor of Russia, when made acquainted with this intention, gave orders to despatch a chasseur, to be in constant attendance on the travellers during the expedition: and he moreover ordered a proper pocket chronometer, from the Imperial Institute of St. Petersburg, to be sent after them.

REMARKABLE CONSEQUENCES OF A FALL.—Doctor Stegman, in a work entitled 'Medical Observations,' mentions the following curious effects produced by a fall, a case in which he was himself the sufferer. He fell from an inconsiderable height on the floor. The force of the blow affected principally the major trochanter of the right thigh, but there was neither fracture nor dislocation; not-

withstanding this, at the end of seven months he could not move without crutches. Immediately after his fall, he felt a remarkable aversion for several kinds of food, of which he had before been fond, especially sugar, milk, and wine; other things on the contrary, which had been disagreeable to him before, as beer, &c. became palatable. The author attributed these effects to a concussion of the spinal marrow, occasioned by the fall.

ROYAL PRESENTS TO GERMAN AUTHORS.—Herr von Schlegel, the author of the Ecclesiastical History of Northern Germany and the Hanoverian States, has been honoured with a gold snuff-box from the King of England and Hanover, in token of his Majesty's approbation of that work: and Herr Düring of Frankfort has been presented with a beautifully worked gold cup, from the Duchess of Clarence, as an acknowledgment of the pleasure received by her Royal Highness from his last novel 'Sonnenberg.'

GERMAN TRANSLATION OF LINGARD.—Lingard's History of England has been translated into German by the Baron von Salis, and published in ten volumes at Frankfort.

THE FRENCH ARMY.—Proportions of various callings in every one hundred of the contingent for 1827:—Men employed in works in wood 7; in iron 4; in leather 3; in stone, including miners 4; agricultural labourers 48; writers or shopmen 2; tailors 2; boatmen and sailors 2; other callings 23; persons without profession living on their means 5. The proportions of the three preceding years offer nearly the same results. The average of the various stature in every hundred, in the examinations of 1826, proved as follows:—between 570 and 651 millimètres* 37; between 652 and 678, 19; between 679 and 703, 17; between 706 and 733, 12; between 734 and 767, 12; 788 and above, 3.

* Millimètre 0.03937 in.

LITERARY ANNOUNCEMENTS.

'*The Golden Lyre*; or, Specimens of the Poets of England, France, Germany, and Italy,' is to be published again this year, by Mr. Hans.

A volume of Autobiography, by Sir James Turner, the prototype of Sir Walter Scott's Captain Dalrymple, is preparing by the Bannatyne Club. The Memoirs extend from 1633 to 1670, comprising a full narration of the Insurrection in Scotland in 1666. A few copies will be printed for sale.

A Map of England and Wales, upon a new plan, in which numerals and letters are substituted for the names of places and rivers, the former being used to denote the places, while the latter designate the rivers. With an Explanatory Key. To be published by Messrs. Dymond and Dawson, of Exeter.

'*The Heraldry of Crests*,' 18mo., containing 3500 Crests, from Engravings by the late J. P. Elven; with the bearer's names alphabetically arranged, and remarks, historical and explanatory; forming a companion to 'Clarke's Easy Introduction to the Study of Heraldry.'

The author of 'The Revolt of the Bees' is about to publish 'Hamden in the Nineteenth Century, or Colloquies on the Errors and Improvements of Society.'

 John Murray, Albemarle-street.

THE FOREIGN QUARTERLY REVIEW.
NUMBER VIII will appear **NEXT WEEK.**
 30, Soho Square, July 28th.

LIBRARY OF ENTERTAINING KNOWLEDGE.
THE PURSUIT OF KNOWLEDGE UNDER DIFFICULTIES, ILLUSTRATED BY ANECDOTES, will be published on the 10th of August.

This Part of the Library of Entertaining Knowledge will contain two Portraits, engraved on Steel, of **JOHN HUNTER** and **JAMES FERGUSON.**
 London: Charles Knight, Pall Mall East.

ELLIS'S HISTORICAL LETTERS.
 First and Second Series, with Portraits and Autographs, in 7 vols. crown 8vo. beautifully printed by Davison, Price 4l. 4s. boards.

ORIGINAL LETTERS illustrative of **ENGLISH HISTORY**, including numerous **ROYAL LETTERS** from **AUTOGRAPHS** in the British Museum and one or two other Collections, with Notes and Illustrations. By **HENRY ELLIS, F. R. S. Sec. S. A. Keeper of the Manuscripts in the British Museum.**
 'If antiquaries in the fortunate situation of Mr. Ellis, intrusted with the keeping of Literary and Historical treasures, would, like him, give up to the humbler but important duties of Editors, a portion of the time which they are too fond of devoting entirely to abstruse speculations upon points connected with their favourite pursuits, the world of letters would gain incalculably by their labours. Instead of one man of learning, or a few such men, exhausting their ingenuity upon the materials within their reach, while the rest of the world were excluded from the inquiry, the whole force of the literary community would be brought to bear upon the whole fund of disquisition, and the rich treasures now in a great measure hid from the public eye, would become both accessible to all competent workmen, and, through them, available to the use of mankind at large. The gratitude of the republic of letters is therefore, as it appears to us, eminently due to Mr. Ellis for setting so good an example; and we trust, he will be encouraged by the public in such a manner as may both make him persevere in the same course, and induce others to follow him.'—*Edinburgh Review.*

We have now but to say, that we are delighted with these volumes, and to recommend them altogether as deserving of the utmost public favour; for entertaining narrative—for curious illustration—for the correctness of long received historical theories—for the development of famous characters—for the discovery of new and important facts—and, in short, for every thing that renders such a Collection interesting in a country that is keenly alive to the value of such researches.'—*Lit. Gaz.*

'We take leave of Mr. Ellis, with many thanks for his valuable publication.'—*British Critic.*

Those Subscribers to the above Work who have one only of the Series, may complete their Set. Early application is necessary, as but a few odd series remain on hand. Apply through the respective booksellers, or to **F. J. Mason, 6, Holywell-street, Strand.** Also, Just published, Embellished with 38 Engravings, neatly done up in Cloth and Lettered, price 7s. 6d.

TAYLOR'S MIBABLIA, or THE WONDERS OF NATURE AND ART. Comprising upwards of three hundred of the most remarkable Curiosities and Phenomena in the known World; with an Appendix of interesting Experiments, in different Arts and Sciences, for the instruction and entertainment of young people. Selected from the researches of eminent travellers, historians, and naturalists. Printed for **F. J. Mason, 6, Holywell-street, Strand.**

TERRO-METALLIC TEETH.
MR. A. JONES, Surgeon-Dentist to his Royal Highness the Duke of Orleans, 43, New Bond Street, begs to acquaint the Nobility and Gentry, that, from many years' intense application, he has invented and brought to perfection, a New System of Fixing **TERRO-METALLIC, NATURAL, and ARTIFICIAL TEETH**, from one to a complete Set, which are so accurately fitted as not to be distinguished from the original, and answer all the purposes of mastication, articulation, &c.—Mr. A. J. continues stopping decayed teeth with his unrivalled Anodyne Cement, which in one minute allays the most excruciating pain; and by this means carious teeth are wholly preserved and rendered useful, even if broken close to the gums. This being a metallic composition, it becomes hard as enamel in a few minutes, will not decompose with the heat of the stomach, and resists the effects of acids, atmospheric air, &c.—Cleaning, and every operation incidental to Dental Surgery.—At home from ten till five.

COLOSSEUM, REGENT'S PARK.—The Proprietors of this magnificent EXHIBITION, invite the attention of the Public to the

NEW ARRANGEMENT OF ADMISSION.
 To view the stupendous Panorama of London, from the principal Galleries,—the original Ball removed from St Paul's Cathedral,—the Prospect from the summit of the Building,—and the Saloon for the reception of Works of Art - - - - - 3s.
 To view the Panorama only - - - - - 2s.
 To view the Conservatories, Fountain, and Swiss Cottage - - - - - 2s.
 * * * Children, half-price.—Open from 10 till 7.

ÆSCHYLUS, GREEK AND ENGLISH.
 Just published, price 7s. boards.

THE PERSIANS; containing the Greek Text of Porson, as corrected by Bishop Bloomfield, Dindorf, and Schütz; literal Prose translation, answering line for line, on the opposite page; copious English Critical and Explanatory Notes, elucidating every difficulty of Idiom or Allusion; Parallels and Illustrations, from the English Poets; and an engraved Plan of the Battle of Salamis. For the Use of senior Greek Students. BY **WILLIAM PALIN, Private Tutor.**

Printed by R. Taylor, Red Lion-court, Fleet-street; and published by Longman and Co. Paternoster-row.

The Series will comprise the best Tragedies of Æschylus, Euripides, and Sophocles; each printed separately, but uniformly, and on the same plan. The Editor's object is not so much to convey the beauties of the Author in his Translation, as to enable the Student thoroughly and easily to understand them in the original; and to render elegant and attractive a study which is, with common aids, laborious and repulsive.

IMPROVED TERRO-METALLIC TEETH.

MR. HOWARD, 52, Fleet-street, (removed from 33.) having brought to perfection an important improvement in **TERRO-METALLIC TEETH**, respectfully solicits the attention of the Nobility and Gentry to his new method, which he is confident will be found on investigation to be far superior in natural appearance and durability to any ever before produced in England. They perfectly restore the articulation and mastication, and are not to be distinguished in any respect from the original teeth.—52, Fleet-street. At home from 10 till 4.

TO MUSICIANS.
NO. III. of THE LONDON QUARTERLY GENERAL CATALOGUE OF MUSIC is just published, price 6d. by Simpkin and Marshall, Stationer's Hall Court. No. II. contains the New Musical Works published in London in the first quarter of 1829. No I. contains all the New Musical Works published in the year 1828: upwards of 4000 publications.

JAMES'S IMPROVED FLUTES. These Flutes, which Mr. Tulon has pronounced the best English Flutes he ever performed on, and which, he further observed, in a company of professors, were far superior to Monzani's, are made and tuned under the inspection of Mr. James, Editor of the 'Flutist's Magazine,' at the following moderate prices:—

	With French Plug C keys.	Of the most highly finished description, with silver plates to the C keys.
An 8-Keyed Flute (tip with silver)	£8 8 0	£10 10 0
A 7-Keyed ditto, ditto	7 7 0	9 9 0
A 6-Keyed ditto, ditto	6 6 0	8 8 0

For Mr. Tulon's opinion on these popular Instruments, see 'The Harmonicon' and Mr. James's 'Flutist's Magazine' for next month, August, 1829.

THE FLUTIST'S MAGAZINE.—On the 7th of August Messrs Simpkin and Marshall, Stationer's Hall Court, will publish, price 4s. Nos. 17 and 18 (incorporated) of 'The Flutist's Magazine,' which will be found, on inspection, of a more interesting nature than ever since its first establishment. It contains, in the Musical Department, the celebrated Fantasia, played by Tulon at his concert, and a Fantasia, by Besbiguer, in the Barcarolle in 'Masaniello,' and all the favourite airs in 'Masaniello,' arranged as solos, by W. H. James.

* * * The Amateurs of the Flute are respectfully informed, that Mr. James has incurred the great expense of re-printing those Nos. of his Magazine which were out of print. 'The Flutist's Magazine' is therefore now complete from its commencement, at the following prices: 1st vol. 24s. in boards; 2nd vol. 10s. in boards. A Second Edition of No. 16 is just published, price 2s. Amateurs of the Flute are likewise informed, that Mr. James continues to give lessons on by no means extravagant terms, at 45, Warwick-street, Golden-square, or at the pupil's own residence.

This day is published, price 5s.
CHOZAR AND SELA, or the SIEGE of DAMASCUS, and other Poems, by **JAMES FLETCHER,** of Clare Hall, Cambridge. London. W. Mason, 10 Pickett Street, Strand.
 'This is a little volume of poems, simply and prettily written; they are manifestly the productions of an author of cultivated taste and agreeable fancy.'—*Sun.*
 'Mr. Fletcher's "Chozar and Sela" contains some well-founded observations of human nature, remarkable in a person of his age, combined with many pleasing poetical images.'—*Spectator.*

In 8vo. price 3s. stitched.
A SUPPLEMENT to BENT'S LONDON CATALOGUE OF BOOKS, (published in March 1827,) containing all the New Works and New Editions published in London, from that period to June 1829; with their Sizes, Prices, and Publishers' Names.

London: published for the Executor of the late W. Bent, by Longman, Rees, Orme, Brown, and Green; and sold by Baldwin and Cradock; Simpkin and Marshall; and Whittaker and Co. Of whom also may be had, postage free.

BENT'S MONTHLY LITERARY ADVERTISER, and Register of Engravings, Works on the Fine Arts, &c. containing Advertisements on Subjects of Literature and the Fine Arts only, and published on the 16th day of every month, in 4to. price 7d. An index is given in the Number for December; and with the January Number a Supplement is issued, containing alphabetical Lists of all the New Works and principal Engravings published during the preceding year, with their sizes and prices.

AN IMPORTANT DISCOVERY for PRE-SERVING and BEAUTIFYING the TEETH and GUMS, ROWLAND'S ODONTO, or Pearly Dentifrice. The high and important character this Powder has obtained from some of the most eminent of the faculty, has induced Messrs. Rowland to offer it to the Nobility, Gentry, and Public at large, as an efficient Vegetable Powder, composed of ingredients, the most pure and rare, selected by an Indian Botanist, and possessing extraordinary powers in realising a Beautiful Set of Teeth—sustains them in pristine purity, whiteness and firmness; averts decay; and strengthens the Gums.

On **UNSOOUND and IMPERFECT TEETH,** ROWLAND'S ODONTO operates as a renovator! excluding all deleterious matter from its comest seat, and clearing the way of impediment, producing beauty and stability.

Price 2s. 9d. per Box, Duty included. Each genuine Box has the Name and Address engraved on the Government Stamp, **A. ROWLAND and SON, 28, Hatten-garden,** which is posted on the Wrapper.

The Genuine is sold by all respectable Perfumers and Medicine Venders who sell ROWLAND'S MACASSAR OIL and KALYDOR.

ROYAL YORK BATHS, 54, YORK TERRACE, REGENT'S PARK, near St. Mary-le-Bone Church.—**W. JAMESON** respectfully informs the Nobility, Gentry, and Public, that these Baths have undergone great improvement, and are now ready for use at a moment's notice, from Five in the Morning until Eleven at Night. The strictest attention will be paid to those Ladies and Gentlemen who may honour them with their Patronage.

TERMS:	
A Warm Bath	0 2 6
Six ditto	0 14 0
Twelve ditto	1 5 0
A Real Sea Water do. ..	0 7 6
Artificial ditto	0 4 6
